I decided that while looking for caribou I would try to get a photo of a bull moose, Daniel, who is the best caller I ever heard, proposing to give me a chance. One day on a ridge in the burnt woods near the deadfall, Daniel called for half an hour or more without getting an answer, finally remarking that most callers did not call long enough, for oftentimes moose would start from a long way and might not answer at first, or might be so far away that he could not be heard if he did. He said that he was going to call for an hour or more. At last we heard a bull grunting, apparently coming toward us and then going back. This he kept up for quite a while. As he came nearer we could hear him strike the trees with his antlers, and as he came over a low ridge through the burnt rampikes we had an exhibition such as I never heard or saw before. The dead trees were very thick together, and from two to six inches or more in diameter; when Daniel called, the bull would start with a rush, swinging his antlers right and left, making a racket as loud as a dozen men would make striking the trees with sledge hammers. For two or three rods he would clear a path like grass before a mowing machine, then stop and shake his head and call the cows along nearly to him.

By this time Daniel would call again. This would apparently arouse his ire, for he would start with another rush, breaking down everything before him for a short distance, stopping again to rest, only to repeat at the next call. This he did several times right in sight of us, but when he had cleared a path almost to the edge of a bog, he stopped and we could not call him any nearer.

We were on an open ridge about 100 yards away, and decided to try and work our way nearer. After a few steps we lost sight of him, but went on, and as we neared the place where we had seen him we heard something start and go over the ridge. Daniel hurried to the top in time to see the two cows going off. I had stopped where I had last seen the bull, for I was sure he would not run—he was too ugly. As Daniel came back, I noticed the bull standing behind some bushes not over thirty or forty feet from us, but so screened by them that I could not get a picture, and of course could not shoot, as we both had our game limit. Daniel tried to get a better view, but stepped on a branch, which cracked and started him. Instead of following the cows and going back the way he had come—he was near the edge of the burnt strip—he turned and went right out into the opening we had come through. I hurried after him, but when I got in sight, he was nearly twenty-five rods away, too far for an exposure.

How I wished that Mr. Rice had been with us. He could have got a prize that many never saw the equal of.

The blades were entirely different from my big 5-foot set, being very wide, at least 20 inches, spreading very wide at the tips, and with a great many points, one of the largest and handsomest set of antlers I ever saw. Although I had not got a snapshot. I had had an experience of perhaps a lifetime. The one thing lacking, besides possession and a photo, was a phonograph that would have recorded the terrible racket as the dead trees went down like a whirlwind before his powerful head-gear. We followed him some two or three miles, thinking that as good a direction to go as any, and started him again. Daniel called and got an answer several times, the bull once more coming nearly to us, but the fickle wind started him in a hurry, and we went back to camp.

We waited a few days longer, hoping that the bear would come back, but as he had eaten the meat about all up before we discovered it, we came to the conclusion that he had left it for good, and as the caribou seemed to have left this region, too, Archie went out to the settlement for the team to take us back. A few days later William came for us, and in two days we were back again at Mr. Holt's. Here the next morning I bade adieu to our guides, and with the big head carefully loaded with our other things, started for Boiestown. I supposed that I was then out of the game country, but it proved not so, for as we were driving through some woods a lynx ran across the road some five or six rods ahead of us.

I would like to speak a good word for our guides and helpers, one and all. I can heartily recommend them in every way, and their hunting grounds, in which a summary of the game seen foots up as follows: 30 moose, 21 bulls, 9 cows, three of the bulls as large as any outside of Alaska; 9 deer, 1 bear, 1 lynx, 2 foxes, lots of ducks, and more partridges than I ever saw on a trip before. Although it had taken twenty-eight years to secure the prize, I certainly was satisfied with my "success at last."

CHAS. D. BUTLER.

The Old Hunter's Bean Story.

THE Old Hunter and I were eating supper by our camp-fire after a hard but successful day's hunt. "Colonel, please pass the beans," says he. I passed them.

We finished supper and filled our pipes. "Colonel, them are beans sorter remind me of a bean deal that I made once." I scented a story and asked for it, and finally got him started.

"It was this way," he began. "I and a pard were out on a hunting and prospecting trip in the foothills. We had a pack horse and took grub a-plenty, but when we was about to our stopping place the darned horse fell in fording a stream and rolled over a few times, and all our flour and meal was spoiled. About all he had left was bacon and tobacco. We was upset like but went to hunting and prospecting and waited to see what would happen; but we knew that one of us would sure have to go in soon for flour, and it were about ninety miles—and a hundred and eighty miles was no joke. Well, one morning pard he took the horse and started on to the fork to get an elk, as they was scarce around our camp. Way long toward night I seed the smoke about half a mile below, and I thought it might be Injuns. Bymby I heard a shot and I couldn't stand it no longer, so I sneaks down that way and, coming near the smoke, I hears men talking, and I knewed that it was Injuns, so I just nozed along and, coming in sight, I seed four wagons and a lot of pilgrims. I walks up and hails them, and the gang flocked around me like buzzards round a carcass. They was the darndest outfit that you ever seed. One pilgrim was from Old Missouri, another lank cuss was from Vermont and one little dude was from Boston, and the rest was from nowhere in particular. They had got together somewhere and had struck out to find what they wanted. The man from Old Missouri wanted to find a place to start a cattle ranch; the Green Mountain man was after a farm. The Boston man wanted air, and the balance was after anything that was loose. I sorter looked them over and squinted into the wagons and seed dead loads of grub and thinks to myself, now is our chance to get flour and such. After a spell I got kinder tired answering their darned fool questions and sorter hinted round that I'd like to buy some flour, but, darn their fool hides, they wouldn't sell a pound for gold dollars. Then I asked for beans; yes, they had two sacks, but wouldn't sell a bean. The fact was they had everything that we needed, but they wouldn't sell a thing for my gold coin. They was frying bacon and it sorter struck me that they didn't have any fresh meat, so I sorter drifted round and began to talk hunt, and their ears stuck up at once. Then I found out that they had a few old scatterguns, and the dude had a good Winchester the same size as mine, but the only time he had shot it off it kiked him over and come close to killing a horse. He hadn't let any one else shoot it, and they were hungry for fresh meat and was eating bacon. Well, I felt sure that I had them, and told them

that game was powerful scarce, but if they would stay a day or two that I thought I could help them out. I seed that they was as ornery a lot of pilgrims as ever herded into one bunch, and as it was getting dark I started for home.

"I got about half way when I hears something in the brush, and getting down close to the ground I seed the tips of the horns of two bull elk. They was moving enough so that I could make out which way they stood, and, being right close to them, I figured out about where to shoot, and bangs into one of them, and he dropped; t'other one jumped and stooped, and I gave it to him as he tumbled down. Them blame pilgrims heard me shooting, and I could hear them buzzing like a nest of hornets. By this time it was powerful dark, and I wanted to take the inards out of them elk, so I scratched round and gets some bark and dry wood and soon had a big blaze lighting up the elk in great shape. I had got one fixed up when the whole band of pilgrims come, with lanterns and guns and the darned dude with his Winchester.

"Cornel, you just ought to seen them darned fools act. The dude wanted the horns (he called them antlers), 'Old Missouri' wanted the hides, and they all wanted meat. I told them that I wanted that 'ere meat to jerk for winter; that it war fine meat, and would last me till spring, and that game was so scarce that I sure couldn't get any more, and that I considered it was a dispensation of Divine Providence in my behalf that I got the elk sorter like the ravens feeding Elijah. They wanted to take a hindleg right off and pack it to camp and cook it, but I sorter thought that them old bull elk mightn't be quite as tender as a spring chicken, and told them I wouldn't cut them elk up till morning, but I gave them the livers, and away they went. I had figured it out the liver was about so, whether it was old bull or out of a calf. I was sorter suspicious of them 'ere pilgrims, and camped right there and kept up a fire all night. 'Long in the morning they come; they was full of liver and was feeling good; they wanted both of them 'ere elk, and they wanted them bad. Finally, after enough dickering to have bought the Pacific Railroad, I swapped them 'ere elk for 200 pounds of flour, 200 Winchester cartridges, some baking powder and matches, and their two sacks of beans. There was a big row about the beans, and I thought that I would have to lower my hind sight, but I began sharpening my knife and getting ready to cut up the elk, and that fetched them. I made them take a horse and pack their plunder to camp and give me a bill of sale of it afore I would let them touch the elk. They then loaded their elk on to a wagon and was just going to start along when up comes my pard leading our horse with the hindquarters of an elk and two saddles of venison loaded on the horse. I introduced my pard to the pilgrims, and we lights out for camp afore they had time to catch their breath.

"You ought to seed my pard when I showed him that 'ere grub and cartridges and truck. I told him the whole yarn, and he says, 'You served the ornery cusses right. If they'd let us have a sack of flour, we'd give them the two elk.' Well, in about an hour up comes the dude and Old Missouri. The Missouri man had a tale of woe. First the meat was tough. I grinned and asked him if he calculated that old bull elk was going to be all tenderloin and stuffed with young turkey. Then he tried to get mad, and said that I had cheated them, and spoke of the load of meat that my pard had brought in. I told him that Providence was taking care of my pard, and again referred to Elijah and the ravens. That made him so mad that he quit talking, and the dude commenced. He thought that I had cheated them, and I told him about the 'antlers' and how fine they was to hang up in the halls of his ancestors in Boston. Then he begged for beans, and said that they thought that they had some more, but was mistaken, and that there wasn't a bean left in their camp, and he wanted us to give them back a sack. I called his attention to my first trip to their camp and their refusing to sell me a pound of flour or a bean. He begged and almost cried, and I told him if they would give us their Winchester and all the cartridges and 100 pounds of sugar that they could have a sack of beans, but that we was only doing it out the kindness of our hearts and on account of a kind Providence providing for us. Well, they swapped, and that is the end of my bean story." HUNTER.

The Expenses of an Outing.

Editor Forest and Stream:

SOME inquiries have been made in regard to the expense of a western hunting trip after big game, and what is necessary to make it a success. In regard to expense a great deal depends upon how much or how little one can be satisfied with. The average man, used to the ordinary comforts of his civilized environments, should be careful to see that he does not neglect to supply himself with as many of these as he can without too greatly increasing the expense and the bulk of what has to be taken.

The season of the year makes a difference also. Late in the fall or during the winter any one who is not accustomed to camping out in cold weather will find a tent with a light portable sheet iron stove, which can easily be carried on a horse's back, very serviceable.

The last hunting trip I took in the West was late in the fall, and I had everything complete. I will enumerate what I had and then state the cost: I had a guide and a cook; a tent for myself and another which served as quarters for the two men with me, and also for a dining room; a sheet iron stove for each of the tents, which, with several lengths of pipe to get rid of the smoke, weighed very little; two folding tables and several chairs which packed into very little space; plenty of warm bedding and underwear; a liberal supply of canned stuff—soups, meats, vegetables, preserves, etc.—besides the usual standbys, flour, bacon, my rifle, ammunition, etc., and a few books to read when I was tired of hunting and wanted to loaf in camp. The cost was as follows: Guide, \$5 per day; cook, \$3 per day; eight packing horses, 50 cents apiece per day; six dogs, no charge.

Provisions, consisting principally of canned stuff from 15 to 20 cents a can, I purchased at St. Anthony, Idaho. I had about \$60 worth of canned stuff, and had some left over after camping out thirty days. In round figures it cost me about \$14 a day while camping out. This expense can be cut down, if one wishes to economize. Great care, however, should be taken about attempting to cut off too much.

I have heard adverse criticism in regard to canned goods, but in my own experience I find them most serviceable. What are generally sold contain, as a rule, a large quantity of water, and this adds unnecessarily to the weight and bulk. A great deal of the stuff can come in condensed form, and before cooking water can be added to it.

The success of a hunting trip depends almost entirely upon the guide. Great care should be taken against securing the services of any one without first finding out something about him in advance. If you are fifty or one hundred miles out in the wilderness and your guide should prove unsatisfactory, you cannot conveniently dispense with his services. In that case you have nothing to do but to make the best of a bad bargain.

With the disappearance of big game most everywhere, and the greater difficulty of securing it, more skill and special knowledge are required now than formerly. There are a good many men who have been out and shot large game who would not make competent guides. The man whose time is limited must select as his guide someone who has a good knowledge of woodcraft and understands the habits of wild animals. E. F. R.

Massachusetts Fish and Game.

Boston, Sept. 17.—Editor Forest and Stream: The action brought by Warden Bent against Charles Letendre, of Swansea, for having in possession three black ducks, resulted in the discharge of the defendant, which was followed by the arrest of Oscar Mailhot, the attendant in charge, who has been found guilty and a fine of \$60 was imposed by Judge Lovett. An appeal was entered. The case is of considerable interest from the fact that hundreds of these birds are kept by sportsmen for use as decoys.

For the taking of shellfish in that portion of New Bedford Harbor condemned as contaminated waters by the State Board of Health, and in which the taking of bivalves was prohibited by the Fish and Game Commission, twenty-eight arrests have been made. It is not improbable, in case fines are imposed, that appeals will be taken, as these are the first cases that have been brought under the law of 1901 which was enacted to safeguard the public health.

For the last few days Chairman Collins has been examining ponds which he commenced soon after his appointment as chairman of the board by Governor Wolcott in 1899. These examinations, designed to determine the depth, character of the bottom, and especially the temperature at different depths, can best be prosecuted in the summer and early autumn, and are of great value in determining the kinds of fish best adapted to propagate in them.

Commissioner H. O. Stanley, who has made a magnificent record in practical fishculture in Maine, told me he had no doubt many of the ponds in this State are adapted to landlocked salmon.

Your readers who have fished in the lakes of the Pine Tree State for the past twenty years have had substantial proof from their own observations of the results of judicious stocking. Years ago trout and salmon fry were planted, but Mr. Stanley tells me they are now planting fingerlings only. Some of us have been urging this method for Massachusetts the past six years, and at the present time our commissioners would be glad to adopt it if the hatcheries furnished adequate facilities for the rearing of fingerlings. Just here is where our State is deficient, and it behooves the fishermen and Commissioners to set to work at once and in earnest to remedy this defect.

Gunners who have been out for shore birds along the south shore, report getting a few plover, peeps, and yellowlegs, but birds are not very plentiful. The severe storm of this week has driven in many sea fowl, and many coot have been killed. At Nantasket the summer visitors are being succeeded by devotees of the rod and gun. Some of the winter hotels have already put "coot stew" on their bills of fare.

Many big catches of smelts have been reported of late from the Weir River and the waters about Nantasket Point. Gunning stands are being put in order for shooting ducks and geese. Mr. George Gorham Peters and party left Scituate a few days ago with Captain Robert Webster in charge of his launch, for a second trip to Nantucket after birds. Mr. Peters' anchorage is in the North River, a short distance from his summer home. The people along the lower portion of the river have been anxiously and vainly looking for results of the shad-planting of several years ago. They charge the failure to the rubber factory up river. I anticipate they will be heard from under the "Gilded Dome" next winter.

A gentleman who has a farm a few miles from this city, has adopted a plan for saving the quail about his place for several years during the winter. He keeps them well supplied with grain, and they look for it every day just as much as his domestic fowls do.

Several gentlemen who contributed last spring toward the purchase of quail, urge that steps be taken to persuade the hunters to refrain from killing quail this fall. I doubt not many bird hunters would be influenced by remonstrances from friends. Some—those who read such papers as the FOREST AND STREAM—may be able to restrain their inclination to secure large bags and content themselves with three or four or even a couple of birds. The man who hunts for the market never gets enough. If he can, he will get ten or twelve from a bevy of fifteen in the afternoon, and go out next morning for the rest. It would be well for every one to remember this fall that, according to the best judgment of many sportsmen, there is not one quail now in our State where there were twenty one year ago. Moderation in shooting and large expenditures in restocking for one or two years more can alone avail to bring back the numbers of 1903.

Mr. S. A. Tucker, well known as the Parker gun man, tells me that in a section of Rhode Island where he, with three others, has the shooting privileges over several hundred acres, from investigation recently made, there are enough birds if they are not killed off this fall to replenish the stock in a few years.

Most of our shore hotels that do not cater to sportsmen in the autumn are now closed, but many of our city residents are lingering in the mountains and have been getting good strings of trout in the branches of the Pemigewasset and in Baker's River. Ex-President G. W.

Wiggin, of the State Association, who has a summer home in Sandwich, N. H., tells me that President Cleveland recently got a fine lot of black bass in Asquam Lake.

Dr. W. C. Woodward, of Middleboro, enjoyed his trip to Newfoundland very much. Lack of rain early in August made the fishing poor, but on the 16th he killed five good ones, the largest 21 pounds.

Many of our sportsmen are already preparing for trips in pursuit of big game next month. CENTRAL.

Abyssinian Game.

UNITED STATES COMMISSIONER SKINNER writes from Marseilles, France, concerning the Abyssinian sportsman and his game:

The Abyssinian is a great lover of firearms of every description, and the best revolvers and carbines find ready sale in the country. The Abyssinian army is equipped with the Gras, the Weterli, and the Remington rifles. The chiefs and under chiefs are armed with modern rifles of small caliber and rapid fire. The importation of arms has been regulated and interdicted, except under authorization regularly accorded by the Government. The sale of arms to the uncivilized and conquered tribes is forbidden, and is only permitted at present among the Christian Abyssinians.

The elephant, rhinoceros, and hippopotamus are still numerous in various parts of the empire. Lions of moderate size are found in the wooded mountains; and of a very much larger size in the warm plains. Leopards of enormous proportions are found in the neighborhood of Boulga and Ankobar. The guepard, lynx, hyena, wolf, wild dog, and jackal may be encountered very generally. The droves of buffalo, almost destroyed by the bovine pest in 1897, are now multiplying rapidly. In the western part of the country giraffes are occasionally encountered. The ostrich, of a very fine variety, is common. The zebra is met with on the plains of moderate altitude, and the wild ass in the rocky mountains to the north. Antelopes and gazelles of every conceivable variety and in great numbers are found everywhere. In the region of the Hawash River we frequently saw as many as 50 and 100 antelope moving together. Among the more notable varieties are the bubalus, koudou, oryx, and gnu. Many species of chamois are also found more or less generally, among which is a diminutive species, known locally as the "dig-dig," the weight of which rarely exceeds ten pounds. Included in a long list of other animals more or less frequently encountered are the boar, wild hog, badger, marten, hedgehog, and many others which have not been studied.

Among the birds are included the bustard (giant, medium and small), guinea fowl, the red partridge, heath cock, partridge, grouse, pigeons and doves, ducks, teal, curlew, and woodcock. Among the birds of which the plumage is sought are the marabout, crane, heron, black-bird, parrot, jay, and hummingbirds of extraordinary brilliancy. Birds of prey include varieties of the eagle family and the vulture. The thousands of varieties of insects and butterflies would delight the scientific student.

Guns and Gun Feats.

NORTHWOOD, N. Y.—Editor Forest and Stream: I once shot a squirrel I couldn't see, and killed him without hitting him. With my father, I was walking up an old woods trail near Little Black Creek above Northwood. We saw a red squirrel run into a hole in a beech stub. I fired at the hole, and the squirrel came tumbling out and to the ground, where he flopped around. Examination disclosed no open wound, but the skull was fractured into small pieces. The rifle was a .32 caliber rim-fire long. I am not an accurate shot usually, but I have killed ruffed grouse on the wing with a rifle—one a cross shot. George Pardy here habitually shoots running rabbits with a rifle. Shotgunners have had entirely too much prominence of late years, and I am glad to see rifle wisdom and rifle lore getting due share of attention. The reason modern rifle users don't get the old-time effect from their projectiles, seems to be due to the speed of modern bullets. A hammer will disable quicker than a razor. A BB cap will kill quicker at close range than a .22 long rifle cartridge when used on small game. Game shot in the vitals travels further these days because the shock of modern bullets is that of a knife blade, and not of a hammer. R. S. SPEARS.

Another 100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

102

WHILE still-fishing from Niagara River at Fort Erie, Ontario, Canada, opposite Buffalo, Dr. Cohen, of Buffalo, caught on his hook a small brass cannon 4½ inches in length. Without doubt this miniature cannon was made by a British soldier while stationed at "Old Fort Erie" nearly a century ago, and was lost in the river. It is probably a fac-simile of a cannon in use at the fort at that time. Between the trunnions on the upper and under side there is a cross-patonce, with a "broad arrow" run-

ning from each trunnion to between the two arms of the patonce. This "broad arrow" mark shows that the miniature piece was copied from a British cannon, as this mark is used on all British ordnance. The bore of this miniature piece just admits a .22 cartridge.

Dr. Cohen presented the find to me some five or six years ago, soon after he "caught it." My opinion has always been that he should have presented it to the Buffalo Historical Society. But the Doctor knew that I had a propensity for acquiring any such old thing, and I never thought of proposing to him to donate it to the Historical Society. Ultimately it may get there. J. L. DAVISON.

SEA AND RIVER FISHING

Camp Lockwood.

THERE is much that might be said about Camp Lockwood that I am sure would prove interesting to everybody who has ever camped in the wilderness, as well as those who may take it into their heads and out of their pocketbooks to do so. But, like many other seemingly great events in life, it is my firm belief that the events that transpired there are most interesting to those involved. Consequently the only logical excuse I can find for betraying the secrets of that wildwood session is the possibility that I may inadvertently encourage someone else to indulge in the mysteries of housekeeping where the servant girl problem does not enter, and one is glad of it.

Camp Lockwood, in the beginning of its existence, resembled a well governed, well groomed camp-meeting outfit of a religious persuasion that not many people believed in. Our party consisted of nine persons when we pitched out tents. The ladies of Camp Lockwood were plainly but well gowned, and each one wore one of those serious expressions made up of, we will say, ten component parts—nine parts real heart hope, one part fear. Of the expressions of the men, one might say that of the ten component parts, nine were fear and one hope. Nine well mixed faces of this sort were, to say the least, impressive. In betraying this first secret of Camp Lockwood, I am bearing in mind the fact that I must find some reason and make it public for all these expressions. Camp Lockwood was located on the Manistee River in Michigan, thirty miles from a looking glass; and of the nine principals in this camping party, four were women, and not one had ever slept outside of a bolted door before. These two facts all by themselves are enough to make the average woman look mysterious and even solemn, notwithstanding the fact that three of them had fearless husbands with them, and the other one her dauntless father as protector against everything real and most things imaginary. From my own standpoint of thought it now occurs to me to say that the imaginary evils of the wilderness were the things which caused me the deepest anxiety and the only unhappiness I felt while there. In comparing notes with my fellow-campers, I verified my own thoughts.

It is indeed singular, however, how soon the average woman can forget—providing, of course, she has a boon companion to help her. Her native courage is unassailable. We all know this. But in the time of imaginary danger she needs company, and for the first few sunsets in Camp Lockwood, husbands and others were in great demand. But native courage grew apace, and soon any one of our fair companions would enter a dark tent unhesitatingly, but generally with her arm around the waist of one of her fair and brave companions. It's a singular thing, but a real true one, that in an encampment of ladies, if one of them wants lavender water or a clean handkerchief, the very desire becomes infectious; it's good for the druggist, but hard on the washerwoman. This infection, I noticed, was most pronounced after dark, and the same infection applies to my reference to forgetfulness. They help each other to dispel the dangers of our tame and well tramped wilderness. They look the heroines of old just so long as the other tent is within reach of a fish-pole. In further relating the life of Camp Lockwood, it occurs to me to deal with incidents rather than generalities. In this way I am more apt to earn the everlasting affection of my friends as well as increase the circulation of *FOREST AND STREAM*—bearing in mind the fact that the ladies of Camp Lockwood have many friends.

We made our camp just where we did because we knew the trout fishing was good there; and while not a picturesque country, it is a very healthy one. Our captain of industry, Mr. Harry Widdicombe, of Grand Rapids, with his usual forethought for the comfort of everyone, devised the idea of driving a well in order to have excellent drinking water for our party. This was done before the tents were up. I do not know the name of this pump, nor just how far down they drove to get water, but we had well water and well people during our entire two weeks' stay.

Twenty-four hours after our settling down, Mr. Widdicombe was elected mayor with only one dissenting vote—his own. Mr. Russell W. Woodward, of Elizabeth, N. J., on account of his love for all the sweet things that nature supplies, was dubbed the Professor. Mr. C. L. Lockwood, of Grand Rapids, did considerable protesting over the naming of the camp Camp Lockwood until he was notified of, or waked up to, the fact that it was for Mrs. Lockwood and not himself that the name was selected; which reminds me to remark how easily some men are quieted down. Mr. Ralph Widdicombe, being an expert with the fly and rod, and having no one to defend but himself, was looked to to supply the camp with trout until the time came when the encumbered members of our party could be spared. I found myself being called the Duke. I didn't ask why at the time, thinking I might find out later; but I never did, and I don't know now. However, it was a short name, sounded well, and, like Ralph's dog, I soon got used to it, and many a time did the dog and I both respond at the same time, but the other Duke got the most petting.

I recall that in my early experiences in the far West, most eastern people were called tenderfeet; and while the same conditions in a way exist to-day, they do not apply so well, as was seen by the real display of enthusiasm shown by the Professor's daughter. At four o'clock on the second morning, going from camp alone, she disappeared with Mr. Lockwood's waders. At six the alarm was sounded, and Ralph was soon on his way through the brush to one of the small tributaries to the Manistee River. A mile from camp he came to a bridge, and just above the bridge, in the middle of the stream, he discovered Miss Mabel casting feathers like a veteran. Not caring to disturb so fair a bit of fishing, he dropped into the creek and started fishing himself. At this particular point, however, there was much overhanging brush, and

good fly-casting was necessary for successful work. On reaching the bridge, Miss Mabel sat down and watched her unconscious companion break his second leader, and then called to him that from "her experience he would find more trout in the brook." The young lady from the East supplied her own breakfast the second morning in camp, and with her the other ladies became large contributors and consumers of all meals thereafter.

Some of the most delightful evenings I have ever known have been spent in Mr. Woodward's library. His vast collection of fishing pictures and books have shown me what a remarkable class my love of fishing has placed me in, besides bringing about the sweetest friendship I have ever known, at the same time allowing me the privilege that sometimes comes with such a friendship of telling of the conversion or emancipation of a fisherman.

Like many fishermen of the old school, this splendid disciple of Izaak Walton was essentially and by right a bait-fisherman, had been one for many years, and bade fair to end his days plugging for trout, and thus to be deprived of that peculiar sensation of striking a flying trout with a No. 10, as well as missing many sessions of that school of patience known only to the fly-fisherman.

When Mr. Woodward accepted the invitation for himself and daughter to become members of this camping and fishing party, I'll not accuse him of supplementing his acceptance by saying, "Can I get plenty of anglerworms out there?" but the question certainly was asked the same evening. And supposing, as I did, that the whole earth was full of anglerworms, I replied "Yes." It was not until we reached Grand Rapids that I learned a new bit of interesting natural history—that the anglerworm follows the plowshare; but finding good company in Mr. Widdicombe in my innocent deception, we landed thirty miles from an anglerworm with cruel secrets in our hearts.

The first day in camp Mr. Woodward didn't fish. He studied the flowers, rested, and looked for worms, but looked in vain. Tuesday the second day a grasshopper's life wasn't safe within a mile of camp. Wednesday, with the assistance of the ladies, a landing-net was converted into a minnow-net by adding mosquito netting to it, and our pretty little minnows by the improvised wharf grew scarce and timid, and, like the grasshoppers, became the victims of the chubs. Had our encampment been on a public highway, there would have been a poster nailed to a tree which would have read: "Wanted—Half peck of fat 'night-walkers'; \$10 half peck; anglerworms same price. All farmers, mechanics, and everybody else take notice." In the meantime, daily the flies went swirling through the air, and our big live box in the river became plentifully supplied with trout; and I—well I, through sheer sympathy, avoided my best friend, while my conscience smote me hard. The next day I succeeded in getting Mr. Woodward to go with me. On this day he was able to accept the truth, but not to analyze it. The Mayor took him the next day, and he got as far as "addition," before night. On Saturday one of the teams went to town for supplies, mail, and other things. Just how much of Mr. Woodward's money went along, he has never told. Suffice it to say that on Sunday he met the team well down the road and footed into camp with his precious little can of wary anglerworms from somebody's little garden spot far away.

On Monday he was to fish with Ralph, and the way in which that can of worms was forgotten when the boat pushed off down the swift current of the Manistee is a mystery, but they were, and, as fortune would have it, the trout rose that day splendidly. It was dark that night when these two anglers dropped from the wagon by the camp-fire, and we all knew from the peculiar tilt of Mr. Woodward's hat and the keen squint in his eye that "something was doing." On counting their catch for the day, the results were R. W. two in excess of R. W., and all done with flies. Entering his tent, Mr. Woodward was heard to remark to a small can of anglerworms near the entrance, "My little friends, you and I have parted company."

Next day, however, he weakened just a little. It was his day with me. He looked at that can fondly, with the remark, "I know some deep holes up the river where you would fit well; my love for you is not entirely dead, but I'll leave you for another day." About ten o'clock that morning we were surprised to see a man fishing the river just below us; a second look assured us that he wouldn't be in our way long, for he was a "plugger." Mr. Woodward was fishing well ahead of me, but I closed the gap between us as fast as I could to see these strangers of the same "lodge" meet. I really expected to see a salaam of some sort, not fewer than three perfectos and two anglerworms exchanged, and an invitation to dinner extended. But not so. With a "Good morning. What luck?" my friend passed this man by like an express train losing a freight train.

While sitting on the edge of our boat at noon eating our lunch, Mr. Woodward was about half-way down a slab of bread cut all the way across the loaf, when a trout leaped a couple of hundred yards up the river. That slab of bread was never finished. He grabbed his rod and struck off up against a ten-mile current nearly waist-deep after that trout. Unable to pull his floating creel along, he went without it. In fifteen minutes he was back. I asked him if he caught that fish, and if so, what had he done with it. He assured me he did; then he took the trout out from between his head and his hat, put it still alive in the live box, and went on fishing.

That evening by the camp-fire we told him his conversion was complete. He replied by saying, "No, but my emancipation is."

A feature of particular interest to all fishermen was our care of the fish we caught. We used only floating live boxes, which we tied to our belts. On leaving the river at night, our boats were put on the wagons, then the well in the boat was filled with water, the trout were transferred to it, and when we got to camp these live fish were

put into a live box in the river. For meals as many as were needed were taken out with a small net. In this way we fed fifteen people sufficient trout each day, and when we broke camp we turned loose over 250 trout from seven to fourteen inches long. There will be good fishing there next year.

The ladies of our party—Mrs. Widdicombe, Mrs. Lockwood, Miss Woodward, and Mrs. Batten—all became seasoned campers, and dealt out to us all the comforts and many of the luxuries of home; and while I know that it is the nature of the average woman to stop the clock of time, the general sentiment in parting seemed to be, another summer cannot come soon enough.

T. E. BATTEN.

An Outing in the Ozarks.

I am tired of planning and toiling
In the crowded hives of men;
Heart-weary of building and spoiling,
And spoiling and building again,
And I long for the dear old river,
Where I dreamed my youth away,
For a dreamer lives forever
And a toiler lives but a day.

THUS I mused as I sat at my desk one fine day in June, and decided right then I would go the very next day to one of the beautiful streams in the Ozarks. I called on my old friend, Col. Elder, a disciple of Izaak Walton, and as true a sportsman as ever cast fly or put gun to cheek. The Colonel being agreeable to a week's outing, by 7 o'clock the next morning we were aboard the Frisco, with baggage checked for St. Clair, Mo. Our destination was the hospitable home of Mr. Emil Mantels, on the banks of the Bourbeuse River, seven miles from St. Clair. At the farm we received a hearty welcome, and, having donned outing clothes and gotten fishing tackle together, were called to dinner. Our hostess made all kinds of excuses for not having time to prepare anything, but the table fairly groaned with the products of the farm.

This was not our first trip to the farm; we knew the lay of the land and headed for the boat landing. The Colonel is an expert carsman, and we were soon at a point where, in less than an hour, we had a bucket full of minnows that would discount any sure lure bait ever invented. Then we drifted down to the fishing ground; but it was early in the day and "nothing doing," so I climbed up on a big rock overhanging the river and, in a reaching position, gazed on the beautiful surroundings. A kingfisher would fly lazily by, and now and then a turtle would come to the top of the water and then disappear. Occasionally a bullfrog would croak in the distance.

The soft, balmy June breeze fanned my cheek as I looked out over the beautiful clear waters, and I thought of the old Indian legend our host had told us, "That whosoever drank of the water of the Bourbeuse would return again." My mind wandered back to the days of Hiawatha, Nocomus and the laughing Minnehaha, when, suddenly, I spied an Indian, dressed in war paint and with eagle feathers in hair, poke his head up over the rock. He came creeping toward me, nearer, nearer. I tried to call to the Colonel, but my tongue cleaved to the roof of my mouth. Closer came the savage. I could see his hideous countenance, and almost feel his hot breath on my cheek; he grabbed me by the throat. "Hal! Hal!" he cried, "I've got you."

I heard an awful splashing in the water below, and as I peered over the edge of the rock I beheld a sight that would make the blood of a sportsman tingle with ecstasy. The Colonel had hooked a four-pound bass, and it was putting up a royal fight.

After the fish was safely landed in the boat, I regained my seat and remarked to the Colonel that I must have been asleep on the rock. "Yes," he said, "I think so; you've been very quiet up there for the last hour and a half." Just then my cork started for the bottom of the river, and Colonel's followed suit. We both got busy, and for three hours had excellent sport. On reaching the boat landing, we transferred from our strings into the live box nine bass, two crappie, one channel cat and one eel.

The days following were one round of pleasure; with excursions over hills, down through the shady dells, and hunting and fishing. We were loath to go when it came time to do so. After thanking our host and hostess for the pleasures we had enjoyed during our short stay, we bade them good-bye and started on our journey home.

St. Louis, Mo.

Horn Pouts in a Trout Pond.

Boston, Sept. 16.—*Editor Forest and Stream:* As a subscriber and interested reader of your columns, I take the liberty of trying to secure information and advice on a subject that is both puzzling and irritating, inasmuch as I have hitherto been unable to obtain much satisfaction.

I have a splendid trout pond of about ten acres in Vermont, fed by cold springs, gravelly bottom, with abundant food. A few years since horn pout were let into the waters by accident. They have become so numerous that I drew off the water last week at large expense, hoping to rid the pond of the pouts. I saved the trout and killed millions of pouts, but the larger ones in numerous quantities hid themselves in the mud or deposit on the bottom, which varies in thickness from one to two feet all over the pond.

The question that now puzzles me is to exterminate those concealed in the mud. Some have advised me that two months' time will kill them; others say a winter's freezing will be necessary to exterminate. I shall be glad to hear from expert advice.

HORN POUT.

To Broder's Cabin.

THE Red Gods called in the summer solstice, and an impaired constitution—the legacy of a two years' ramble in tropical America—cried for relief to the mountains, the tamaracks, and the balsam firs. The cattleman, Smith, companion of last year's outing to Klamath and Crater lakes, delicately hinted that a similar excursion would nicely fill out his programme for the present year, and Police Judge Edgar had intimated that a month spent in aboriginal simplicity with two or three boon companions in the heart of the Sierras would be the most satisfactory substitute for musty court rooms and harassing criminal problems of anything within the range of possibilities. In short, the pressure from different quarters became so strong that the writer succumbed, and after adjusting every business obstacle, nothing remained but to decide the route.

To the north the big trout of Klamath offered a strong temptation; but the lovely mountain meadows, the higher altitudes, and the incomparably grander scenery of the Kaweah and Kern River country appealed to our memories with irresistible power, and the morning of July 6 found us at the Santa Fe depot in Berkeley, on the way to Visalia. Arriving at our destination, we found Mr. Huntley, our host of two years ago, awaiting us with a carriage, and we were rapidly driven to his residence, two miles out on the Mineral King road. As we entered the fan-palm shaded driveway that leads to the mansion, we saw Mrs. Huntley standing in the doorway, who welcomed us with a gracious hospitality that placed us at once as much at our ease as if we had just arrived home, and after a hasty toilet we were ushered into the dining room, where we did ample justice to a bountiful repast.

The high summer temperature of this section had been duly considered when the mansion was built; great trees shaded its roof and broad verandahs encircled both lower and upper stories, our beds for the night being spread in the rear end of the latter to give us the full benefit of the little air that was stirring.

It was a glorious view that greeted our vision as we lay on our couches and looked toward the east. Sixty miles away, sharply defined against the clear, blue sky by the rising sun, the great range culminated in a series of peaks that represent the highest points in our country outside of Alaska. Saw Tooth Peak, over 13,000 feet, was plainly in view, but so lofty were many of the adjacent summits that we could only identify it by its singular shape.

Early in the day we drove to town for the necessary supplies for the trip, while the two lusty Huntley boys, Wilfred and Chester, the former of whom had decided to go with us, overhauled and repaired the kiacks.

Between Visalia and Lemon Cove there is 18 miles of valley road, the last half being through the dreaded "hog-wallow land," destitute of shade and blistering in the sun, while the next twelve miles to Three Rivers over low foothills are but little better. Two years ago Dexter and the writer had plodded over this on foot leading a pack-horse, sweltering in the heat and choking with dust and thirst; it was not a pleasant memory, and we determined to avoid it if possible. Arrangements were therefore made by which we were to be taken that night in a wagon to Three Rivers, where the boys were to meet us with the pack animals. This plan worked to perfection; we reached the citrus groves and little hamlet of Lemon Cove about 10 P. M., but all its inhabitants seemed to be in bed; not a light was visible even in the big brick hotel where Dexter and I had vainly endeavored to woo the drowsy god with the assistance of all the cooling drinks the place afforded, and at 12:30 we unhitched in Britten's corral at Three Rivers and spread our blankets beneath an oak tree, where we slept soundly until broad daylight.

Soon after sunrise the boys—who had traveled nearly all night—came in with a horse and three burros; two of the latter were heavily packed, and the others under saddle. It is thirty miles from Three Rivers to the Giant Forest, most of which is a stiff upward grade, but every mile of it took us into a cooler, more invigorating atmosphere, with colder and purer streams, and the last ten were in the tall timber of the Sierras, which we were longing for as the hunted deer longs for the water brooks.

We made a two days' trek of it, stopping the intervening night just within the park at a water trough where we had camped two years ago; the grade at this point ran for several miles along a steep side hill covered with chaparral; this made good browse for the burros, and we bought hay and grain for the horse from a freighter encamped there.

The next day we reached the Broder & Hoppin camp in the forest, and the ensuing three days were spent in this delightful retreat visiting the big trees, washing our clothes, and resting generally. The Park guards this season are a regiment of colored cavalry, the same who did such gallant service at San Juan Hill. Some of the officers were white, and some colored, and the commanding officer, Captain Hamilton, was said to be a son-in-law of General Chaffee.

On my previous visit to the Park I had been puzzled to account for the scarcity of deer there, in a region well adapted to their wants and rigidly protected. Later I heard it asserted by several individuals that while the soldiers allowed no civilians to shoot there, which was perfectly proper, they never neglected to kill them themselves at every opportunity, something which I think the Government did not contemplate; one man stating that seventy-five dry hides were sent out from one camp. So much for hearsay, now for facts. When we were there two years ago, we did not see a deer in the Park or hear of one being seen. This year they can be seen almost every day within sight of the tents of the Broder camp, which speaks well for the fidelity of the colored troopers.

The Government has completed a wagon road into the forest as far as Moro Rock that necessitated heavy blasting in many places, and short ladders have been placed upon the rock itself to facilitate the ascent. A substantial picket fence has been erected around the General Sherman sequoia, and several new trails made. Parties were coming and going every day, and Broder had more than thirty pack mules out with tourists.

We had intended to go from here to the King's River

Cañon, but the late rains, so essential to the growth of the summer grasses, having failed to materialize this year, feed was reported to be very scarce in that section, and on the 14th we started for Alta Meadows, nine miles distant and 3,000 feet higher than the forest. We arrived there early in the day, and how glad I was to see them once again. There they lay before us in all their pristine loveliness, with their wonderful profusion and variety of flowers, the fairyland home of the butterfly, hummingbird, and water ousel. Here around the campfire of two years ago had gathered that galaxy of brilliant men—Merriam, Muir, Wittell, and Keith; here Dexter and the writer had sought to renew their youth by a snowball game just above on the summit of Alta Peak.

There is a sharp descent on either side of the Alta range; our packs were still quite heavy, and the climb had been so severe on the burros that we decided to relieve them somewhat by taking the horse, a gentle, powerful animal, although rather too large and clumsy for mountain trails. Beautiful as Alta was, it was lacking in some of the attractions we were seeking; there was no fishing there, and, being within the Park, no hunting was permitted. Starting early the next morning, we soon reached the Park line, where a squad of cavalry were encamped, who broke the seals to our guns, and the Judge started out ahead to look for deer. The trail now took down the Buck Cañon, one of the steepest and most difficult in that section. The horse, unused to the pack, made poor headway, and finally slipping from the narrow path fell, rolled over a couple of times, and brought up against a large fallen tree about fifty feet below, with the pack under him and his feet helplessly in the air. Fortunately he escaped with a few slight bruises, and after removing the pack we soon had him again on the trail, but in the fracas the writer was thrown violently to the ground, and striking his knee against a rock, was so badly crippled that he was obliged to take to the saddle, and the accident ultimately changed the programme of the trip.

We had now reached the haunts of the blue grouse and mountain quail; in the high pines and firs we found the former fairly abundant, and every meadow had its colony of quail, while along the trail a few deer tracks indicated that some of these had ventured beyond the confines of the Park. But a few deer tracks do not always assure venison, and after dropping down over 3,000 feet we made camp in a clump of sequoias at the edge of a little wet meadow. The Judge came in hungry and tired, having hunted faithfully all day without seeing a hoof. For several years past the most of the deer in this country have for some unknown reason forsaken the higher altitudes for an elevation of 4,000 or 5,000 feet, and are much more abundant in the vicinity of the Kaweah power house than they are in the more remote and higher sections, where there would seem to be more security.

Our next camp was at Cliff Creek, a fine, clear, rapid stream, well stocked with trout and environed by magnificent timber and bare, rocky cliffs many hundreds of feet high. Its only drawback was a dearth of feed, and for that reason we stayed but one night.

The next day we climbed up through the forest that abounded with blue grouse to the top of Timber Gap, and looked down upon the cabins of Mineral King, 2,000 feet below us. As we descended we passed the ruins of the quartz mill that first brought this district into prominence, and from which it received its name. The rise and fall of the Mineral King mining district, with all its skyrocket effects, has had many duplicates, both here and in Nevada, but there were some features connected with it that merit at least a passing notice. The district came into prominence in 1878, when a number of well to do men, few if any, however, being experienced miners, had built a road in from the valley and erected a ten-stamp quartz mill. The rock assayed well, and seemed to be in unlimited quantities; there was plenty of water and timber, and although the elevation was 8,000 feet, a town sprang up almost in a night in true mining camp style, with one long street up the cañon, three hotels, saloons, etc., and about 1,500 inhabitants. The mine itself was nearly a thousand feet higher and had a kind of a double wire trolley arrangement by which the ore was conveyed to the mill, the weight of the descending loaded buckets pulling up the empties.

Everything went on swimmingly until after a couple of months' run a batch of the supposed bullion was taken down for assay, when it was found that all the precious metal it contained could be put into a small baking powder can, the antimony and arsenic in the ore having so sickened the quicksilver used in amalgamating that it destroyed its separating qualities, and nothing had been saved.

The result was that the people got out of there even faster than they had gone in; winter was approaching, with its snowfall of from ten to twenty feet, and a kind of the devil-take-the-hindmost stampede ensued, only five or six deciding to hibernate there until spring. This prompt action doubtless saved many lives, for during the winter a snow-slide swept the mill, all of the hotels, and most of the other buildings, into the bottom of the cañon, 100 feet below, practically wiping out the whole town.

All this took place twenty-five years ago, but as we passed the ruins of the mill it was interesting to note the terrible havoc wrought by the avalanche. The 50 horsepower engine, protected by the overhanging wall of the ledge, out of which a portion of the mill site had been blasted, had escaped with the loss of most of its lighter attachments; but everything else had been swept away. The 4-inch wrought iron cam shaft was bent into an ox-bow; the great mortar blocks five feet square, twelve feet long, and bolted down with 2-inch iron rods, had been torn out and carried many rods down the hill. Of the pulleys, nothing remained but the hubs, and the amalgamating pans, six feet in diameter, of heavy boiler-plate, were twisted out of all recognition, and some of them had been carried to the creek bed, 400 yards away.

We did not stay long at Mineral King, of which more anon, but pushed on over the divide to the headwaters of the Little Kern, and early in the afternoon of July 21 we drew up our animals in front of the Broder cabin. As we crossed Farewell Gap we found the same huge snow-drift, or one just like it, that we had traveled over two years ago, and below it the flower beds of lupins, Mari-

posa lilies, columbines, etc., that were there then, except that they were a little less gorgeous this time, either because we were two weeks earlier or from the failure of the usual late spring rains. Up to this time the weather in the mountains had been delightful, not even a shower to discommode those traveling without tents; but clouds had begun to gather away in the direction of Mt. Whitney, and we could hear the low muttering of distant thunder as we lifted the kiacks from the burros and placed them beneath the friendly roof.

Two years' wear and tear with no repairs had made some changes for the worse in the interior of the Broder cabin; the bunk we had used by night and the table at which we eat had both been partially dismantled, and probably used for fire-wood by some storm-bound tourists or hunters, and some of the chinking blocks had gone the same way; but the roof was in a good state of preservation, and the fireplace still serviceable.

Our first care was to cut enough boughs for our couches from the silver firs that grew everywhere about us, and then the rods were jointed for a cast in the waters of the Little Kern, a stream which, small though it was at this point, always had an inexhaustible supply of trout. It was here that the piscatorial talents of Wilfred, the boy of the party, blazed forth with most effulgent ray; all the rest of us were easily distanced in the contest, and in a couple of hours we secured over 30 fine trout, as many as we had any present use for. My unfortunate knee had not healed as rapidly as I had hoped for, and climbing among the rocks of the creek became so painful that I was obliged to give up fishing for the remainder of the trip; the loss, however, was only that of my own sport, as one man could easily supply our camp from this prolific stream.

The next day we had our first thunder storm. They began about two weeks earlier than usual, and occurred nearly every day during the remainder of our stay in the mountains. There was no day during which there was not more or less sunshine, but the storm sometimes lasted several hours, with a heavy precipitation that seriously impaired the fishing.

Eighteen miles east of the Broder cabin by a direct but very steep trail, or thirty-five by a circuitous but much easier one, there is a body of water about a mile long and one-quarter as wide; it is called Kern Lake, and was created about twenty-five years ago by a landslide that dammed the Kern River. It abounds in large trout that lurk among the sunburned logs and stumps that furnish them with admirable retreats and destroy the angler's tackle at the same time. There is good fishing from its banks, but several parties have packed in canvas boats, and there is an old dugout there that can, by industrious bailing, still be kept afloat.

It had been our intention to visit this lake and cast for some of the lunkers known to be there, but the unexpected early rains, coupled with my own crippled condition, and the fact that we had no tent, was sure to make the trip over the now slippery trails one of discomfort and possible danger; there was plenty of trout where we were; not so large, perhaps, but equally palatable, and coming, as we did, solely for health and pleasure, we did not care to include in the trip any more disagreeable features than were necessary, and as none of the party would consent to go and leave me behind, it was decided to turn back and spend the balance of our vacation at Mineral King. Fate had again decreed that the Broder cabin should be the limit of our wanderings, and on the morning of the 24th we brought in the burros and started up toward the Gap. The brush was still wet with the last shower, but the sun was shining gloriously, woodchucks were sunning themselves on the rocks that overhung their burrows, and mother quail sounded an alarm note to their half-grown broods as we climbed the steep ascent, but long before we reached the summit the clouds were again pouring down upon us a cold, pitiless deluge of rain and hail that chilled to the bone both man and beast. Farewell Gap, however, is a barrier that the earlier rains seldom cross, and once well down on the other side, we rode out of the storm into the sunshine again, and this, the most unpleasant experience of the whole trip, became only a memory.

We made camp at Mineral King that night in a tamarack grove that sloped gently down to the bank of the stream. It was an ideal spot, and the surroundings were so agreeable that we determined to stop a week there. The trees were not so thick but that the grasses, flowers, and strawberry plants grew like a carpet among them; hummingbirds and butterflies were flitting constantly from flower to flower; several of the little rodents locally known as tamarack squirrels were our nearest reliable neighbors. The stream was a favorite haunt of the water ousel, and although it was unmercifully whipped by the constant stream of tourists and summer residents, a few fine trout could always be taken by the skillful caster that were larger and of a more delicate flavor than were those of the Little Kern. All about us were hundreds of acres of pasturage, guarded on the sides and upper end by ranges thousands of feet high, and at the lower end where the road came in by a gateway and a short line of fence that spanned a narrow space in the cañon; stock could be turned loose without rope or hobble; and to our horse who, bred in the valley, detested mountains, or the burros who never voluntarily ascended any place over fifty feet high, it was as secure as the valley of Sinbad.

To the east, giant Saw Tooth reared its mighty peak 5,000 feet above our heads; its summit was probably nearly four miles away as the crow flies, but it seemed to overshadow the camp. While it is much more difficult to climb than Mt. Whitney, it has often been successfully ascended from Mineral King. Zerah and the Judge made a gallant attempt to scale it, but failed after they had reached the tooth, 1,000 feet from the summit, which is almost perpendicular. At an elevation of 11,000 feet they found two small sheets of water known as the Monarch lakes, in one of which many large trout could be seen. Two precious hours were wasted in a cave where they had sought refuge from a shower, and the sun had set when they turned their reluctant steps downward.

It was a lotus-eating life we lived that week in the tamarack grove. There was nothing of the bustle about camp that characterized our nomadic days. More than once old Sol peeped over the crest of Saw Tooth and

found us still in our blankets, idly watching the birds and squirrels among the trees, or dozing to the music of the murmuring stream. A few yards away there gushed out from under a large rock a soda spring, whose cold, sparkling, pungent waters we relished exceedingly. There were other mineral springs about us—sulphur, iron, and even arsenic—but we regarded them as mostly medicinal, and for a beverage always turned to the first.

Breakfast under the above conditions was invested with a delightful uncertainty that would have appealed to the most romantic temperament. The first to arise was expected to build the fire and get on the coffee; later arrivals dropped into such positions in the department as happened to be vacant. It was only when fried cakes were to appear in the breakfast menu that anything like method was discernible; the privilege of making these had by a unanimous verdict been assigned to the Judge, who, with only a short practical experience, had developed a deftness and grace in flipping slapjacks that was as surprising as it was mysterious, and which Zerah and I, whose judgment from many years' experience in that direction was entitled to some consideration, pronounced nearly perfect. The probable source of this elicited much active discussion, Zerah being inclined to regard it as an innate proposition, while the writer confidently asserted that it was the result of the Judge's long and successful career as a technical contortionist in adapting knotty legal situations to harmonize with his own views. A personal appeal to the Judge himself did not elucidate matters, his explanation being regarded as preposterous. In the early days of California mining, an expert at this art was entitled to some perquisites and privileges not accorded his less fortunate contemporaries, and it was stated that the highest grade of operators were able to toss a cake up the chimney and running outside to catch it right side up in the frying-pan before it reached the ground. It was a mistake of ours that the Judge was not submitted to this crucial test while we were at the Broder cabin.

After breakfast had been served on the great flat rock that answered for a table, Wilfred usually jointed his rod and quietly faded away in the brush along the stream, as it was no light task for even a good angler to supply the necessary amount of brain food for four hungry men from the educated denizens of Mineral King Creek. The writer, although confined rather closely to camp, found an abundance of entertainment about him. There was plenty of reading matter, and when this grew irksome, it was interesting to watch the tourists who were coming and going every day, and could be seen for miles as they toiled up the trails to Timber or Farewell Gaps. The wild life about us was a never-ending source of pleasure. The blue grouse seemed to be well posted on the game laws, and brought their full-fledged broods boldly down to the stream within a few yards of camp; one full-grown approached within thirty feet of the fire, and for many minutes watched our operations with the greatest interest from the lower limb of a tamarack, a rather unusual proceeding, even in the close season. It is only fair to observe, however, by way of explanation, that the Judge at that moment was executing his inimitable pancake act.

We were a short distance below the majority of the tents and cabins that clustered about the stuffy little store; the average number of people being about seventy-five, some stopping only a day or two, and others for the season. Among these we found Dr. Montgomery and Mr. and Mrs. Mitchell, of Lemon Cove, who had been our associates at the Broder cabin on a stormy night two years ago.

Three times a week the stage came in bringing the mail, and then everybody hastened to the store to hear old Mr. Cutter call off the letters. The fact that a large majority never expected a letter made not the slightest difference; they were just as anxious to get there.

On the morning of July 31 we broke camp and started for Grunegen's Ranch, eighteen miles away on the steep down-grade that leads to Visalia, where we arrived early in the afternoon, and spent the night, the next day's drive of twelve miles landing us again at Three Rivers, where we found Chester Huntley awaiting us with a two-seated wagon and a span of horses. The delightful climate of Mineral King had now been replaced by the torrid heat of the citrus belt, and while Chester started homeward with the burros early in the afternoon, we waited until nearly sunset before following in the wagon. At 11 P. M. we drove in under the giant oaks of the Huntley domain, to find Mr. and Mrs. H. awaiting our arrival; a bountiful supper was already spread for our refreshment, after which we gladly sought our couches on the upper veranda to dream of our return to the Broder cabin.

FORKED DEER.

A Monster Cod.

UNDER this heading, Mr. E. D. T. Chambers speaks of a cod taken off the Gaspé Coast which weighed 74 pounds. While this is a large fish, still a great many much larger have been taken. On pages 138 and 139 of Vol. I., Section 5, of Brown Goode's Report of Fisheries, it is stated that on Bank Bradley occasionally one would be taken as large as a porpoise, weighing 70 to 80 pounds; and considerable numbers of cod weighing nearly 100 pounds each were taken as late as 1879, ten to fourteen miles from Point Miscou. It is also stated that these large fish were only taken at night; trawls set in the daytime caught only small fish. On page 220 of Section 1 of the Fishing Industry of the United States by the same author, we are told that Captain King Harding, of Swampscott, took one weighing 101 pounds. On July 22, 1873, Miss Fannie Belis, of St. Louis, on board of yacht United States, caught a cod weighing 130 pounds. Captain G. H. Marten caught off Chatham a codfish which weighed dressed 111 pounds. Captain Stephen Marr, of Gloucester, saw a cod taken on George's Bank which, after being evacuated, weighed 136 pounds. Captain N. E. Atwood, on the same page, tells of seeing one which weighed 160 pounds. This fish he describes as being "not much larger than an ordinary fish weighing 75 pounds, but very thick." The father of the writer bought a cod taken on a hand-line off Isle au Haut by Captain Andrew Lunt, of Brewer, Me., which weighed 112 pounds. M. HARDY.

Fish Chat.

BY EDWARD A. SAMUELS.

Coloration of Fish.

I HAVE at different times presented my views in FOREST AND STREAM in relation to the coloration of trout, etc., claiming that mere coloration, no matter how varied it may be among different specimens, should not be regarded as of sufficient importance to justify separating certain groups into distinct varieties. This opinion I advanced pretty fully in the issue of July 23 last. A short time after the article was printed, I received several letters from valued correspondents in which the opinions I had expressed were indorsed in no uncertain language. One of the gentlemen who wrote me—I wish I had permission to use his name here—says:

"I am perfectly delighted with all you say about peculiarly marked trout. With all you say I entirely agree, because my own experience and observation force me to the same conclusion. A man knows little of fish who places any great stress on their coloration. * * * Like yourself, I have handled the trout of Maine, New Brunswick, Nova Scotia, Quebec, and Massachusetts, in all kinds of lakes, rivers, streams, ponds, brooks and estuaries (salt water), but have never found among them any such differences in markings and colors as would lead a fairly intelligent man to class them as separate varieties, much less into different species. * * * We have here a number of lakes and streams in which trout are taken differing from each other in shape and colors much more than the 'sea trout' in salt water differs from one that never smelt salt water.

"So far as my own researches into the causes of this have guided my opinions, I attribute the difference more to the colors of the bottom than to any other cause. Of one thing I am convinced—change the habitat of trout and you change the coloration."

I make this liberal extract from my friend's letter, not because it is an indorsement of my views, although as such it is very pleasant to me, but chiefly that I may put on record an opinion which, it seems to me, ought to be public property.

In addition to the facts I presented in the article above referred to, I would offer still another. A number of years ago I visited the studio of an artist in Boston, who had, although comparatively young, achieved considerable fame from the merits of his still-life pictures. I cannot now recall his name, but will say it was not our old friend Walter M. Brackett, whose paintings of fish have given him a world-wide reputation. Among the pictures he had recently painted was one of a six-pound Rangeley trout. The coloration of the fish he had painted was simply gorgeous. I have, first and last, handled great numbers of those trout, but among them all not one, so far as I could remember, approached in hardly any degree that magnificent coloration. The drawing of the fish was superb—every fin ray, eyes, gill covers, almost the minute scales, even, being depicted with absolute fidelity. But the color! It seemed to me it was altogether too brilliant. As I paused before the painting in closest scrutiny, the artist asked me how I liked his trout. I replied that I thought the painting was a remarkably fine piece of work, but if I dared to criticise it I should say it was altogether too highly colored.

"It may seem so to you," he answered, but the coloration is an exact reproduction from nature, and here is the original study," he continued, taking down from a shelf a small painting. "I made this at the Upper Dam last fall, its accuracy can be vouched for by all who were in camp at the time." I replied I did not question its accuracy, but I had never before seen a trout in such gorgeous livery.

This incident occurred in June. In the following September I was at the Upper Dam, and while I was there the artist, Mr. Coolidge—I now remember his name—arrived, he being an ardent angler as well as painter. A day or two subsequent to his arrival I took a trout in the pool at the end of the quick water below the dam which was of about the size of the one he had painted, and the coloration was fully as brilliant. Never have I before or since seen two such magnificently hued fish in those waters. They had all the gorgeousness of the most brilliant nuptial dress, multiplied tenfold, if such an expression is allowable. The eyes of the artist glistened triumphantly as he gazed upon my beautiful prize. It seemed, as he afterward said, as if I had caught it to substantiate the statement he had made concerning the other fish.

Ordinarily the large trout taken in those waters, even at the close of the season, are far from being beautiful fish, so far as form and color go, and the two I have named were exceptions to the rule. It is not impossible that some writers on viewing my fish when laid side by side with one of every-day colors, would class them as quite distinct varieties, but to an old Rangeley angler they could not be reckoned as such.

In Lake Edward, and in some of the other P. Q. lakes, the majority of the trout are very handsomely colored, even long before the nuptial dress is assumed; but among them all the difference in coloration is not sufficient to class any as varieties.

I have taken trout in Lake Edward quite early in the season—almost as soon as the ice went out, in fact—and more than half of them were very highly colored. I have often wondered at this fact, for the season for spawning had not many months past, and the belief is that after the spawn is cast the fish not only lose their bright lines, but also have a gaunt, dishevelled look, so to speak. The bright colored fish I creeled were plump and well-conditioned, and I can account for this only by the belief that some of those trout do not spawn annually; or in other words, they do not all mature their ova in the same year.

Anglers and others who are interested in our game fishes, will add much to our fund of information concerning them if they will look into this matter and have the question settled once for all whether the salmon and trout spawn annually or biennially.

Coloration of Black Bass.

Every black bass angler has noticed the great variation of color that exists in these fish in different localities. Sometimes bass are creeled from the same water varying all the way from a yellowish brown to a dingy black. I have seen dozens of such bright fish, almost as light

colored as white perch, which have been a long time in fresh water—I do not mean the bass were silvery in color, but yellowish to brown in their varicolors—taken from the wharves at Detroit, Mich. At first I could not identify them as black bass, they were so different from any I had seen. Just across the river, however, at Windsor, fish of very much more sombre hues were being landed, and even after laying specimens of each catch side by side and comparing them, I could hardly be reconciled to the belief that they were of the same species, i. e., the small-mouthed black bass. Although those fish were separated only by the river, which is not wide at that point, the separation seemed sufficient to cause the difference in color, and this proves that my correspondent and I are right in our belief that "a change of habitat produces change of coloration." In many of the ponds of Plymouth county, Mass., one takes variously colored bass, ranging all the way between the colors I have named, some on fine sandy bottoms being extremely bright, while those from more muddy or rocky bottoms are, as a rule, much more darkly colored.

It may be fancy on my part, but it has always seemed to me that the bass taken over bright bottoms were more gamy than those over darker ones. They seem to make stronger runs and leap more frequently and higher than do the others. They do not wander about very much even in the same pond; they seem to be local in their habits, quite home lovers, and the bright ones, consequently, are not often taken in the localities in which the others domicile themselves. All this, of course, is meant to apply to such ponds as I have named. In rivers they seem to follow the current considerably, but not so rapidly as one would suppose. I knew of a lot of these fish which escaped from a protected pond into a river, and it was over two years before any were caught at a point not much over two miles from the place in which they entered the stream.

Does the Black Bass Always Hibernates?

I think not, and for the following reason, although Scott and some other writers describe it as a hibernating species: I have more than once taken good fish through holes in the ice when fishing for pickerel, the bait used being a live minnow. On one occasion I, with some friends, had a number of lines set in a pond in eastern Massachusetts, and during the day the flags were tilted quite as often by big yellow perch as by pickerel, and now and then a black bass was drawn up through the holes, greatly to the surprise of all who were present.

Those bass were strong, active fish, and had no appearance of having been awakened from a hibernating sleep. Mr. Scott cites several instances of the bass being torpid in the winter, hiding in crevices of submerged ledges. There were no rocks in the pond I refer to, the bottom being of clear sand and gravel, the only deposit of mud in it being around the borders, where aquatic plants flourished in the summer months. Whether these fish abandon the habit of semi-hibernation in such localities as this pond, I cannot say; but those we caught were as lively as any taken in the summer, and well-conditioned, too.

Vari-Colored Tautog.

Variation of color of tautog, or blackfish, is often quite marked. Prof. Goode, in his valuable work on fishes, figures a specimen which must have been quite gray in color, with the irregular markings peculiar to this species, and I have taken several as light as the one he figures.

Well-conditioned tautog are often of a yellowish green, or rather light green color on their sides, and I have occasionally seen them almost yellow. Ordinarily, however, the dingy black prevails. And here again we see the effect environment has on coloration. Those tautog which are taken in deep, clear water are much brighter than those creeled from water which is constantly filled with sediment and mud. Thus the tautog caught from the surf-beaten cliffs which are surrounded by the pure water of the ocean are brighter colored and more gamy than those taken in the water of the harbor. Those fish which the angler delights to conquer from the great rocks of Eastern Point, Gloucester, seem to be different in every way from those taken in the harbor, just as the tautog which are caught over the kelp-covered sunken ledges off Cohasset are incomparably brighter, stronger and more gamy than those taken in the muddy water of Weymouth River not many miles distant.

Change in Color of Pickerel.

Every old pickerel fisherman has noticed the great variety of coloration that is found in a day's catch of these fish. This diversity of color has led to considerable error among writers, causing them to classify and describe some half dozen species when they were all identically the same. I have taken pickerel in ponds in Massachusetts which varied all the way in color from a golden sheen on their sides to a dingy, dirty gray. In the same body of water, and perhaps not five rods apart, one captures a bright golden fish and the next will be muddy colored, and as ugly shaped as it is colored. In a great stretch of meadows around the lower in the Schoodic Lake system, where the bottom of the water is of a deposit of alluvium brought there in years long past by the rivers and brooks which empty into the lake, the pickerel are almost invariably dirty gray on their sides. I have taken great numbers in that lake, some of them of large size, but none showed the bright coloration exhibited in fish caught over a cleaner bottom.

Per contra, there is an extensive range of meadows in Massachusetts through which a sluggish river meanders, tapping here and there wide trenches which have muddy bottoms throughout, the bed of the river being mostly of gravel. In the trenches the pickerel vary in color from very bright to dingy, while in the river they are generally light in color, almost yellowish, with beautifully graduated marks and bars of different shades of brown. Pickerel, as a rule, do not wander very much; each individual seems to be content to remain in his own lurking place, and this fact seems to show that the environment does not always affect the coloration of the fish.

Coloration of Deep Sea Fish.

If one stands on the wharves where "bankers" and other deep sea fishermen land their cargoes, he will notice that the cod are of a great variety of coloration, ranging from light yellow to dark grayish brown. I have asked the

fishermen what, in their opinion, was the cause of this variation, and while many professed ignorance in the matter, most of them said the change was due to the bottom over which the cod were feeding. Haddock also show this variation, but not in such high degree as the other. Pollock do not show much difference in coloration; in a hundred of these fish of all sizes, one can detect but slight variation. This may be accounted for perhaps by the fact that they are mostly surface feeders, and as their range is wide their coloration is not affected by the character of the bottom any more than is that of mackerel, bluefish, squeteague, etc.

Apropos of pollock, I find, according to the last Fisheries Report, that it ranks third in importance among the commercial fishes caught last year in the Dominion waters. In the preceding Report there is printed the following strong protest against the destruction of pollock by dynamite:

"The methods employed by many avaricious fishermen this year on the pollock grounds at Grand Manan have been the subject of much sharp and bitter criticism all through the Maritime Provinces. I refer to the killing of them by exploding dynamite cartridges in their midst, by which means, no doubt, half of the fish are lost to the fishermen by their not coming to the surface after the explosion. A law should be enacted prohibiting the landing of fish killed by dynamite, and also the fitting out of boats for this unpopular method of fishing. It is the unanimous desire that this dynamiting should be stamped out completely, and it seems that a law as outlined above would be effective."

Diligent inquiry among fishermen, conducted as quietly as possible, seems to lead to the belief that this nefarious method of capturing the pollock still exists. Of course, no one will say outright that, of his own knowledge, it is still carried on; but such an inference may readily be drawn. If it is continued, there may be a necessity for combined efforts on the part of the American and Dominion governments, for it is a serious menace to one of our most valuable food fishes, which, according to the report above named, shows in the catch of that year a decrease of about 4,000 quintals less than that of the preceding year.

Fishes at the World's Fair.

The fish tribe have the advantage of having a special building devoted to their interests, that of the United States Fisheries Commission. There the young of the black-spotted trout, brook trout, shad, and other species may be seen, and the process of hatching them witnessed. Around the building is a covered gallery or closed arcade lined with aquaria, those on one side being for fresh water fish, such as trout (black-spotted, rainbow, lake, Dolly Varden, brook or speckled, and the imported Loch Leven and brown), whitefish, maskinongé, pike-perch, pike, golden ide, goldfish, catfish, paddle fish, buffalo fish, carp, lake sturgeon, and numerous kinds of gar, bass, catfish, sunfish and perch. Among the brook trout are a number of albinos. A portion of this exhibit is by the State of Illinois.

The salt-water aquaria contain the sheepshead, conger eel, triggerfish, mullet, sea catfish, pigfish, squirrelfish, coney, channel bass, Nassau grouper, the tautog, with its almost human lips; the winter flounder, flat as a sheet of paper, and effacing itself in the sand, from which it scarcely differs in color; the curious triangular trunkfish, marked with conventional star-shaped patterns, as if dressed in calico; the toadfish, an ugly fellow, bearing a striking resemblance to his terrestrial namesake; and the angelfish, of the Gulf coast, with its great wing-like fins which give it some resemblance to the fallen variety of angel at least. There are also lobsters, terrapin, hermit crabs, horseshoe crabs, blue or edible crabs, living conch shells, and various other forms of marine life, to say nothing of the vitoscopic pictures elsewhere that one can hardly believe to be other than living.

In the middle of the building is a tank belonging to the State of New Jersey, in which terrapin swim and crawl

and a number of seals bask, swim and frolic, to the great delight of all visitors, to whom their almost human intelligence is a constant source of wonder.

Somewhat similar, and equally popular, is the tank in the Forestry building filled with beavers from Canada, who are constantly swimming to and fro with their flat, spade-like tails, gnawing sticks, or attempting to build them up into dams, delicately washing their food, or otherwise making themselves interesting.

There are several exhibits of living fish in the same building, most notable of which are those of Pennsylvania and Missouri. The Missouri aquaria illustrate several of the brilliant successes of the Government fish propagation work. Besides fish native to the State, like the black bass, grass pike, croppie, sunfish, bullhead and channel catfish, and the imported German mirror and leather carp, to say nothing of inedible species like the dogfish and gar, there is a fine exhibit of rainbow trout and brook trout from the mountain streams of the Ozark region which have been successfully stocked. The rainbow trout now ascend the Missouri streams every spring. They have become abundant in the Niangu River (including Lake Hahatonka), the Merrimac springs and Blue Springs, on the Merrimac River, and are frequently found in the Current River.

The brook trout are found in the Merrimac, Piney, and Gascondy, and even the grayling, which is of very recent introduction, is beginning to appear.

Bequest of a Trout Pocket.

DENVER, Colo., Sept. 8.—Last fall, just a little later in the season than the present, I was coming up from Chama, in the southern part of the State, to Denver. In order to make time, I had taken a Denver and Rio Grande freight train, which promised to land me in Alamosa in time for connection with an early north-bound passenger. As we approached the summit of Cumbres pass, some 10,000 feet in altitude, the drawhead of a flat car parted, and I missed that Alamosa train by several hours. But I do not regret the delay; it opened up to me one of the finest trout streams it has ever been my good fortune to visit. I have never said a word about it to a soul, promising in my own mind to again visit the spot and have a "hack" at those handsome fat fellows. It came about this way:

The delay necessitated the despatch from Chama of a wrecking crew. Jack, the jolly conductor, "allowed" that this would mean three or four hours waste of time. Mike, the witty Irish "brakie," hazarded that we might kill the time and a few likely trout for the home folks if we only had a piece of string and a few threads of colored yarn, there being no flies in the caboose commissary. Luckily, I had half a dozen royal-coachmen in my pocketbook, given me by an enthusiastic sportsman a few days previous, and Mike scrimmaged up a few yards of coarse wrapping twine. A heavy jack-knife soon converted a couple of willow wands into six-foot rods, and, with a battery of three royals each, we were soon casting in the narrow little creek a few rods from the railroad track. It is Wolf Creek, I think.

The water was so low that one could stride the brook in many places, but there were some deep holes. The cold nights had given the stream a frappé temperature, the frosts had killed off most of the flies and bugs, and those gentle trout were just lying in wait for Mike and me.

It was something like taking prize candy from the neighbor's baby. Talk about rises. Why, those little scamps just fell over each other and broke off fins in their efforts to be "next" first. A couple of crocus sacks served as creels, and they were in requisition from the moment we hit the stream. Approach a deep pool from the shady side, drop the flies gently, and start to draw them back. There was a rush as of a myriad hungry fellows, and, after a short play, in would wriggle three little beauties. Not so little, either, as trout go, for some of them measured thirteen inches, and very few were less than nine. Back into the same pool again, and the

first operation was repeated. Never saw such avid little devils, and yet they were not thin and skinny. Nearly every one was of the native variety, and they fought like Japanese soldiers. A strange thing was that in some of the pools one would not get a single rise, though the little fellows could be seen swimming about in happy abandon, while in the next pool we could not feed 'em artificial flies fast enough. Four times within two hours I made a three-ply killing, and rested with forty-seven to my credit. I am sure that another trout would have run me over the limit, though I did not weigh my catch. As to Mike—well, I am constrained to write him down a "game hog." He said he was "fishing for the babies" at home and the neighbors, too, and that he did not have such an opportunity more'n once a year, and durned if he wasn't going to get all that was comin' to him." And he did—some ten pounds over the limit. However, he had to divide with the conductor and engineer, and his claim that they had "fished vicariously," though he did not quite express it that way, had much to do with lulling my conscience into forgiveness.

A ten-year-old freckle-faced boy who could not kill the limit in three hours on that stream should be spanked and sent to bed without supper. I had intended saving this pretty streamlet that flows into Chama River for my own and the delectation of a few friends, but I am leaving Colorado's gold-girt mountains and purling streams next week, so I bequeath it to him who will. The place is far away from the usual haunts of man; there is only a section house at the summit of the pass, and few, indeed, are they who loiter that way. May my knowledge benefit some brother reader of FOREST AND STREAM.

DILWORTH CHOATE.

Susquehanna River Fishing Notes.

SAYRE, Pa., Sept. 10.—Reports say that for some time past illegal fishing has been daily indulged in on the Susquehanna from Ulster to the State line. Tuesday evening, September 6, Special Game and Fish Inspector W. E. Shoemaker, of Laceyville, assisted by policeman Spencer Brougham, of Sayre, rounded up a company of illegal anglers consisting of J. Hall, Al. Cohn, J. M. Hoose, and J. E. Bliser, and before Justice Murray, of Sayre, the first named pair paid a fine and costs amounting to \$30. The last named paid a like sum, and in addition the cost of a suit of clothes which officer Shoemaker ruined in effecting the capture of Hoose, who endeavored to elude the officer by jumping into the river. Shoemaker is made of the right metal, and promptly followed his man into the water, effecting his capture at the point of a revolver.

Later the same evening officer Shoemaker captured Edward A. Cole and his son Claude, who had in their boat an illegal gig and two rock bass. Cole and his son plead "not guilty," and qualified in the sum of \$200 to appear before Justice Murray September 13 for trial.

If this preliminary move against the fish law violators results in the disruption of the notorious combine that has for several months operated along the Susquehanna, it will be heartily appreciated by all law-abiding anglers.

Ideal fishing conditions continue to prevail in Susquehanna waters, and the bass are biting plenty good.

M. CHILL.

A Pittsfield Set Line.

EMILE JARDAN, Louis J. Marcelle and Carl Bölzer were in the district court of Pittsfield, Mass., the other day, reports the Springfield Republican, charged with violating the fish and game laws. The complainants were Game Warden W. K. Henry and Special Police Officer Worth Stearns. The officers found the defendants fishing in Onota Lake Sunday morning at 4 o'clock, using a line 1,000 feet long, on which were 200 hooks. The defendants pleaded guilty. A fine of \$20 is the minimum in a case of this kind, and the court fixed the fine on Marcelle, with the agreement that Jordan should pay half the amount, which he did. Bolzer, who had no part in setting the line, was fined \$2.50.

YACHTING

TRIAL RACES FOR CANADA'S CUP CHALLENGER.

It is more than probable that American-designed and built yachts will participate in two, if not three, international events in 1905. The Royal Canadian Y. C. has already accepted the Rochester Y. C.'s challenge for the Canada's cup; the Oshkosh Y. C. has filed a challenge with the Royal St. Lawrence Y. C., and unless a challenge is received from an English club, it is likely the former will be accepted; and Sir Thomas Lipton has signified a willingness to have another try for the America's cup, provided he can find a designer to whom he can intrust the work of turning out a worthy challenger.

Of the three events, the races for the Canada's cup will be of the greatest benefit to yachting in general. The rules under which the contesting boats are designed are reasonably sure to produce vessels of good speed and permanent value, as was exemplified in the cases of Strathcona and Irondequoit, the last two contenders for the trophy.

The challenging and defending clubs have decided on smaller boats for the next contest, and the size adopted—30-footers—has met with general approval, and we believe the reduction in size was a sensible move for many reasons, principally because it will mean more trial boats

on both sides for the right to compete for final honors.

Racing boats are excessively expensive in original cost and final running, and the size in every case should be kept down as small as is compatible with the dignity of the event. Up to a certain point it is just as much a test of designer's skill, crew's seamanship, and skipper's cleverness in small boats as in large, particularly when the helmsman is to be an amateur.

For the benefit of the club and the sport at large, we sincerely hope the Rochester organization will see its way clear to throw open the trial races for the selection of a challenger to all boats enrolled in any recognized yacht club in the United States. It is not likely that any but clubs located on the lakes would enter trial horses, but it would in no way detract from the club's distinction in the event if a yacht from another club were selected as a challenger. The challenger would of course sail under the Rochester Y. C. burgee. If the club were to do this, it would create a very favorable impression among yachtsmen, and would undoubtedly add to its prestige.

The Rochester Y. C. won the last races by a very narrow margin, and the result was due to better handling rather than to superiority of Irondequoit's design over that of Strathcona. The death of Arthur Payne, the emi-

nent English designer, which gentleman turned out the boats for the Canadian club, will make the task easier for the Americans; but granting this to be the case, no stone should be left unturned to secure the fastest possible boat as a challenger. There is no better way of doing this than by permitting outside competition in the trial races.

There are a number of keen racing men in Detroit who would no doubt come to the fore if given an opportunity, and the Chicago men would be represented without a question by two or three, if not more, boats. Now that the Chicago Y. C. is offering a thousand dollar trophy for boats of the size selected for the Canada's cup races, a good fleet of new craft is doubly certain.

Aside from the good racing these boats would afford, they would prove a better investment for the owner than is usual in the case of most racing vessels. They can be run economically, one paid hand should suffice, and the unsuccessful boats would make the foundation for a fine class of racing cruisers on the Great Lakes. Boats of this size have been extremely popular in the East for racing and cruising. No finer vessels can be found anywhere than the Buzzard's Bay 30-footers, or the more recent Bar Harbor 30-footers. Keeping such craft in mind, the western yachtsmen should profit by the experience gained

in the East, and follow along the lines found to be successful elsewhere.

We can see no objections to inviting general competition in the races for the selection of a challenger by the Rochester Y. C. and everything in favor of it. By all means let the races be open to all.

Cape May Cup Race.

Sept. 10 to 12—212 Miles.

AFTER having been lost or forgotten for nearly a score of years, the famous Cape May cup, presented to the New York Y. C. way back in 1872 by ex-Commodore James Gordon Bennett, suddenly jumped into the center of the aquatic stage a few months ago when Commodore Morton F. Plant announced his intention of challenging for it when he went abroad with his schooner yacht Ingomar.

As the cup was won by the English cup challenger Genesta in 1885, and subsequently successfully defended by King Edward's cutter Britannia, it was generally supposed that the cup was in the custody of the Royal Yacht Squadron at Cowes, but a search of the historic castle failed to reveal this ancient trophy, when Britain's leading yacht club decided that it had no right to defend it.

Windsor Castle's treasure vaults were then raked over by the royal tooth-comb, but still no cup, and finally the search was extended to Sandringham House, and there, among the royal curios, the long lost trophy was found. No time was lost in returning the cup to the New York Y. C., and last week's race between Atlantic, Endymion, and Vergemere was the result.

So far as last week's race is concerned, the yachts were started at the bell buoy off the Point of the Hook at 1:25 P. M. on Saturday afternoon, but as the yachts mistook the location of the starting line, Vergemere was the only boat not handicapped.

Both Atlantic and Endymion were so far to the eastward of the line that they were unable to get back in time in the light E. air against the strong ebb tide, and as a result Atlantic was penalized 6m. 30s. and Endymion 26m. Vergemere, however, lost all of her advantage at the start by making a short hitch just after she crossed the line, and as a result Atlantic took the lead, with Vergemere second and Endymion last.

All Saturday afternoon the yachts held down the Jersey coast on the port tack and towards evening the wind died away to nothing. Soon, however, the wind freshened to a good sailing breeze, and with spinnakers to port the yachts made fast time to Cape May. Captain Loesch, sailing a slightly better course, soon brought Endymion to the front, while Vergemere took second place.

They were timed at Five Fathom Bank lightship, off Cape May, on Sunday morning, as follows: Endymion, 3:01:00; Vergemere, 3:08:00; Atlantic, 3:23:00.

It was blowing fresh from N. by E. then, and sheets were flattened in for the beat home. Atlantic and Vergemere stood well off shore and on the second tack Atlantic crossed Vergemere's bow, which soon withdrew from the race and went into Delaware breakwater.

Atlantic then turned her attention to Endymion, which boat was keeping in close to the shore, and, after a hard fight, the three-master finally took the lead about six o'clock Sunday morning. There was quite a heavy sea on then, but the boats made good weather of it and all Sunday kept up their windward battle down the Jersey coast, but toward midnight the wind shifted to the W.

Endymion caught the reaching breeze first, but not soon enough to catch Atlantic, which finished at 3:58:16 Monday morning, while Endymion was not timed until 5:01:18, and as a result Atlantic won, covering the course in 28h. 33m. 16s., beating Endymion by 1h. 5m. 2s. Summary, start 1:25 P. M., Saturday, September 10:

	Sept. 11 A.M.	Sept. 12 A.M.
Atlantic, Wilson Marshall.....	3 23 00	3 58 16
Endymion, Geo. Lauder, Jr.....	3 01 00	5 03 18
Vergemere, A. C. Bostwick.....	3 08 00	Did not finish.

In view of the revival of ocean yacht racing, and the talk of a transatlantic race for the German Emperor's cup next spring, and the amount of talk and criticism this particular race has brought out, I would like to make a few suggestions which I trust will be taken in the spirit in which they are written. Before I start in, I would like to say that I believe Atlantic won fairly and squarely, and would have won any way, no matter what happened before or during the race.

To begin with, the New York Y. C.'s original circular called for a start off Sandy Hook lightship, but someone, in looking over the old deed of gift, discovered that all races for this particular cup must be started at Buoy No. 5, off the Point of the Hook (a very bad place to start big yachts, by the way.) When Commodore S. Nicholson Kane, who is always willing to oblige, discovered this, he cancelled the original circular, and issued a new one calling for a start off Buoy No. 5. Unfortunately, the entrance to New York harbor changes from time to time, and now there is no Buoy No. 5 off the Point of the Hook, a bell buoy having taken its place some years ago. The result was neither the flagship Delaware, which was used as a committee boat, nor any of the contesting yachts could find the missing buoy, and the Delaware finally anchored off the bell buoy, which was about where Buoy No. 5 used to be, while the three yachts, thinking that possibly there was a mistake in their instructions, went out to Buoy "No. 5 G" in Gedney's channel, some distance to the E.

Now, while under ordinary circumstances it would have made little difference where the starting line was located, it made a great difference in this particular instance, for the yachts were way to the E. of the line, and had to work back in a light wind against a strong ebb tide. Not only this, but Atlantic and Vergemere being auxiliaries came out under their own power, while Endymion, which was furthest to the eastward, had thrown off her tug's tow line when she arrived at what her skipper thought was the starting line.

When the yachtsmen discovered their error, Atlantic, which had in the meantime shut off her power, was the nearest to the line, while Vergemere, which was about in a line with Endymion, came steaming back.

Racing auxiliaries as sailing craft is a comparatively new game, but if these boats are to be raced as such,

they should either have their propellers taken off or their engines sealed down before the start, and there should be no use of power even for hoisting sail.

Vergemere got over with the handicap gun, Atlantic was penalized 6m. 30s., and Endymion 26m.

Another point brought out by the race, was that nothing should be left to the option of the contestants, and that they should be instructed to round marks either to port or starboard. In this race the yachts had the option of leaving the outer mark (Five Fathom Bank lightship) on either hand, the supposition being that in a long race like this the yachts would be some distance apart. As it happened, only 7m. separated Endymion and Vergemere at this mark, but if they had been a few minutes closer together, Endymion, which was leading, might have elected to round the mark to windward, while Vergemere might have gybed, then who would have had the right of way, and who would have been to blame if there had been a collision? Someone will probably say this is far-fetched, but I recall an ocean race of the Atlantic Y. C. from Gardner's Bay to Sea Gate when Katrina, Sachem, Ramona, Coronet, and Thistle finished almost like one boat, only 4m. separating the first and last yacht, when Katrina beat Sachem by just 1s. for first honors.

The official circulars also stated that the yachts should take their own time at the end of the race, and should finish 100 yards from the lightship. Now, it would be better to pay the captain of the lightship a small amount to take the yachts' time at the finish, which they would

CAPE MAY CUP.

probably be glad to do for nothing, and 100 yards might be far too close for a 200ft. yacht like the Atlantic to come to the lightship under certain conditions where she might need more space to maneuver in.

According to the times taken by the owners of the two leading boats, Atlantic finished at 3:58:16, and Endymion at 5:03:18 on Monday morning, but according to the telegraph operator at Sandy Hook, Endymion was only half an hour behind Atlantic when they passed the Point of the Hook, instead of being over an hour behind as the official figures have it. Whether it was 30 or 65 minutes of course made little difference in the result of this particular race, but nothing should be left to chance and some disinterested party should always take the times so there could be no room for argument. The angle of view makes a big difference in the finish line of a race, and outsiders, not yacht owners, should decide when a line is properly crossed.

The historic Cape May cup for which the yachts raced was first offered for competition in 1872 by ex-Commodore James Gordon Bennett, or the same year the Brenton's Reef cup was offered, but, unlike the last named trophy, it is not a perpetual challenge trophy, but becomes the bona fide property of any yacht holding it successfully through three consecutive contests.

The first race for the cup was sailed on October 10, 1872, when the schooner Dreadnaught, owned by Alden B. Stockwell, defeated Palmer, owned by Rutherford Stuyvesant. Dreadnaught covered the course in 25h. 5m. 40s., or the fastest time on record, beating Palmer by 1h. 39m. 25s., whose time was 26h. 45m. 5s.

The second race was arranged between J. N. Loubat, owner of the schooner Enchantress, and Dreadnaught, which was to have been sailed in October, 1873, resulted in a walkover for Enchantress, as Mr. Loubat refused to allow Dreadnaught time to repair damages sustained by Dreadnaught in a previous race.

The third race was sailed in September, 1877, between Dreadnaught, then owned by Charles J. Osborn; Rambler, W. H. Thomas; Vesta, Samuel M. Mills, and Idler, Samuel J. Colgate. Idler won, covering the course in 40h. 35m. 10s., with Rambler second, Vesta third.

It was eight years before another race was sailed for the trophy, when Sir Richard Sutton, owner of the unsuccessful cup hunter Genesta, challenged for the cup, and the only yacht which came forward to defend the cup was Caldwell H. Colt's old schooner Dauntless. As the wind was very light and dead ahead, the modern cutter had

little trouble in beating the old-time two-sticker, and the cup was taken across the Atlantic.

John Jameson, owner of the cutter Irex, challenged the Genesta for the cup, and on August 14 and 15, 1886, in a race from the Needles to Cherbourg, France, and return. Irex won, covering the course in 27h. 10m. 28s., while Genesta took over 30h.

In 1889 the yawl Wendur challenged for the cup and sailed over for the prize, as the Irex failed to defend the trophy.

In August, 1893, the cup was forfeited by Wendur to the Prince of Wales' Britannia, who was challenged by Royal Phelps Carroll's American cutter Navahoe. The race was sailed in September of that year, and Britannia won, though she lost the Brenton's Reef cup to Navahoe after a very close race.

When Commodore Plant took Ingomar abroad this year, he challenged for the cup. In looking over the records, it was discovered that as Britannia had been sold out of the Royal Yacht Squadron, the cup had long ago been forfeited to the New York Y. C., so the Squadron had no right to defend it.

DUNCAN CURRY.

"Inefficiency of Race Committees."

Editor Forest and Stream:

The letter which appeared in the September 10 issue of FOREST AND STREAM, by Mr. D. G. Whitlock, chairman of the Regatta Committee in charge of outside race to Marblehead under auspices of the Brooklyn Y. C., certainly demands a reply in refutation of the insinuations of attempted deception on my part in the matter of Newasi carrying a professional pilot in the race.

Chairman Whitlock's memory can scarcely be so defective as not to recall a visit I made to his office to consult him on the pilot or navigator subject. I then informed him of an interview I had had with one most interested in the success of this race, and one holding a high position as a sea lawyer, who had defined those who would be eligible to act as navigators or pilots in the race. This definition was as follows:

"Any one who is not a paid yachting man. He may be connected with the navy; may be an officer in the merchant marine, or a Gloucester fisherman, but he must never have received pay in any way in connection with yachting."

Mr. Whitlock was aware that I proposed employing such a person, and also knew that the object of my visit was to have the correctness of this definition either affirmed or denied. While Mr. Whitlock did not give written consent to such a pilot being engaged, he did not deny the right of so doing. Perhaps he did not know. But if he did, and he was the judge, not I, who had come to him for advice, it was manifestly unjust for him to permit Newasi to start, if he knew that a protest could be sustained against her should she finish among the leaders.

Again, if as Mr. Whitlock has caused to be put in public print the statement that I never notified him of the intention of employing a pilot, how, then, does he explain the visit above alluded to?

Some time after my return to New York, I was informed over the telephone by a friend—not by a member of the committee—that the latter were holding a meeting, and that it was advisable for me to be present. It was impossible to go at once, but when I reached the office specified, the committee had adjourned. The next morning Chairman Whitlock was sought at his office, and the fact of Captain Chase being a member of Newasi's crew was immediately acknowledged, for there had been not the slightest attempt at concealment, although this is unfairly and unkindly insinuated in Mr. Whitlock's article.

Regarding the following paragraph in Mr. Whitlock's letter:

"When the Regatta Committee, the morning of the race, made the rounds of the boats, and asked for the names of those composing the crew, the owner of Newasi failed to give name of Capt. Chase, the professional pilot, which may be readily verified by looking at newspaper accounts of the crews, published the morning after the start. The name of another man was given, however, who, we believe, did not start."

I was not on board Newasi at the time the committee made this visit, but a member of my crew who talked with them makes the following statement: "The committee came alongside, and on being asked to come on board, declined, and said, 'You are all right.' They did not ask for the names of the crew, and no names were given at this time." Further, while on shore, at the request of one of the officials, I gave the names of all members of my crew, specifically giving Capt. Chase his title. His name, with his title, appeared in many of the morning papers. Who gave the erroneous name to the other papers I do not know.

I received no official notice of the protest against Newasi, and only learned of such protest being filed through the daily papers. The committee never notified me of any meeting held to consider such protest, and I have never had any opportunity to officially state my case. The only communication on this subject from the committee is a letter dated August 24, 1904, in which I am informed that Newasi had been disqualified.

As to cutting across the shoals: At an informal meeting held at the Brooklyn Y. C. the night before the race, it was agreed by the owners of every yacht to keep to the eastward of the shoals. The commodore of the Brooklyn Y. C. put the question, and a vote was taken on the subject. Shortly after this I left the meeting with my crew and went on board Newasi. If the subject was again brought up and the agreement reconsidered, it certainly showed inefficiency on the part of the officials in charge of the race not to notify Newasi of this change.

If the Race Committee had taken the trouble to find out what conditions were prevailing along the coast (and this could have been done without difficulty), they would have learned that everything was favorable for a fast run. There is no excuse for their not having had at least one of their committee at Marblehead when the boats finished. As the signals marking the finish line were not placed as specified in the instructions, Newasi barely escaped a bad accident, which, had the wind been stronger, could not have been avoided.

A. H. W. JOHNSON,
Owner of Sloop Newasi.

Boston Letter.

BOSTON, Sept. 19.—The yachting season in Massachusetts Bay has now practically closed, and those yachtsmen who delight in racing during the greater part of the summer months are sorry that it is so, for it has been one of the best seasons in many. As usual, the majority of open races were sailed under the rules of the Y. R. A. of Massachusetts. Although one of the classes of this organization did not fill, and there was no racing in another, the Y. R. A. season was very successful. The Y. R. A. champions, as announced by Secretary A. T. Bliss, are Chewink IV. in the 30ft. class, Clotho in the 22ft. class, Hayseed in the 18ft. knockabout class, and Vera II. in the 15ft. class. It is rather remarkable that in three out of four of these classes the champions were designed by Messrs. Small Bros. The 30-footer, Chewink IV., was designed by Herreshoff.

Two classes failed to get records in the Association lists. One of these was the once popular 25ft. class, and the other the new 21ft. class adopted last winter. There were two 25-footers ready to race, but the clubs did not seem to be disposed to take care of them. The whole trouble is that which caused much conflict during the two seasons previous to this one, and much adverse comment in other sections, where class legislation in Massachusetts Bay has been looked upon as emulative; simply the production of extreme racing machines, embodying more or less freak ideas, in a class from which such types were intended to be barred from the start. The other class, the 21ft. class, was unsuccessful because only one yacht was built for it, and this was because, under the rules governing the class, yachts would be produced that were slower than yachts of 21ft. waterline already in existence. The medium between these two obstacles is what must be

reached in order to reorganize successful classes of 25-footers and 21-footers.

The largest class to be raced under Y. R. A. rules was the 30ft. class, which was adopted by the Association last spring. Three yachts were built for this class—Chewink IV. and Wasaka by Herreshoff, and Sauquoit by Messrs. Burgess & Packard. Out of ten starts, Chewink IV. took eight firsts and then stopped racing, as she could not be beaten for the championship. Whether or not new yachts will be built for the class another season is problematical, as the class has not received anything like unanimous indorsement from the racing men, or cruising men, either.

In the 22ft. class, four yachts—Clotho, Peri II., Medric, and Warrior—attended nearly all of the Y. R. A. races that were given. Clotho, which as a centerboard boat last year, could not be measured into the class, was made a keel boat last spring, and managed to measure in at the first of the season. She and Peri II. were very close on percentage throughout the racing. Clotho seems to be able to win in light to moderate breezes, while Peri II. gets the gun in heavy weather. In very light airs Opitsah V. and Medric have it out. Warrior, the only centerboard boat in the class, won her first race on Memorial Day, and did not succeed in getting another.

Yacht owners in this class, and in every other Y. R. A. class, are loud of their praises of Mr. Herbert H. White, who owns Medric. Mr. White is a very consistent racing man, and keeps at it just as hard when he is behind as when he is ahead. He is also the owner of the steam yacht Wild Goose, which accompanies Medric on all racing circuits. In calm weather Mr. White not only takes Medric in tow, but also takes a line from any of the other yachts, which are generally very glad to avail themselves of his offer for assistance. On one occasion, when it was dead calm at Manchester after the close of a race, and there was a race at Marblehead on the following day, Wild Goose had eleven yachts in tow. When the fleet started from Wellfleet for Provincetown on August 31, there was not a breath of air. Mr. White told all hands to hook on to Wild Goose, and towed them the whole distance, about twenty-two miles. Two of the yachts—Early Dawn and Warrior—started out early, and trusted to getting a breeze. They had still miles to go when the rest of the fleet was anchored at Provincetown. As there was no prospect of any breeze, Mr. White got Wild Goose under way again and went after them, towing them to the harbor. Mr. White may not have won the championship

in his class, but he has won something else which is of far more value.

The most popular class of all was again the 18ft. knockabout class, in which the records of thirty boats are given in the Y. R. A. returns. There have been as many as twenty-three of these boats at the starting line of more than one race, and they make things hum when they are striving for vantage. Bat, one of the Boardman one-design boats, started off at the first of the season at a gait that made it look as if it were all off with the rest of the boats. After a few races, however, the others com-

menced to come up, and at the end of the season Bat took second place, while Hayseed, from the board of Small Bros., captured the championship. Hayseed won five straight races in the Cape Cod Bay series that put her in first place. Had more boats gone to the South shore, it would undoubtedly have been a question whether or not Hayseed would have come out ahead; but she stuck to the racing and deserves her championship. Arbeka II., which finished fourth in this class, was the only boat in any Y. R. A. class which sailed all of the races scheduled.

Half a dozen boats were out for the racing in the 15ft. class, which was tried out this season for the first time. Vera II. sailed more races than any other boat in the class, and she also took more first prizes in proportion to the

number of starts. She is a very fast little boat, and appears to be good under almost any conditions. It is believed that this class will become quite popular. A number of orders have already been placed for new boats for next season.

The accompanying record of the Y. R. A. yachts are from tables issued by Secretary A. T. Bliss. It is quite likely that some changes will be necessary on account of pending protests and other things, but it is unlikely that there will be any changes in the relative positions of the yachts.

JOHN B. KILLEEN.

Rhode Island Letter.

PROVIDENCE, R. I., Sept. 17.—Mr. Frank Croker, of New York city, is having a fast automobile boat built by the Herreshoffs at Bristol. It is the first attempt of this firm to construct an out-and-out auto boat. Their Swiftsure, though shaped on these lines, is operated by steam. The Croker boat is now all planked in and is a flush-seamed craft, differing from Swiftsure in this respect. She is now being equipped with a Mercedes engine of 90 horsepower, and a speed of 24 miles an hour is expected. She is more like Standard than Swiftsure in lines, having ends on something of a similar model, with an extremely flat underbody and a very light draft. She is planked with mahogany, finished bright.

Talk of the probability of a new challenger for the America's Cup still takes up much attention in Bristol. The Herreshoffs are all ready to discuss plans if the syndicate for a defender broach the project of building a new boat. There is little doubt expressed about the Herreshoffs being able to design a new model that would beat Reliance 5m. in a 30-mile race. It is understood that some experiments have been made in the boat shop with a view to ascertaining to a minute degree the bending resistance required in steel plating shaped to cover the angles of the hull of a scow type of boat.

The probability is strong that there will be a revival of interest in the local 30ft. cat class next season. For various reasons a decline in interest was noticeable this year, but if plans now talked of materialize there will be plenty of sport in this class another season. At least a half dozen yachtsmen, including one in Bristol, one in Fall River, and several in Providence, are earnestly considering the advisability of building boats for this class during the coming winter. Several of them are owners of boats in smaller classes and have for a long time been enthusiastic racing men. Probably at least three of those who are now considering the matter will conclude to build for the class, and there may be more. At all events, it seems a practical certainty that at least a half dozen of the 30-footers will be in the field next season.

F. H. YOUNG.

Challenge for Canada's Cup.

THE challenge for the Canada's Cup sent by the Royal Canadian Y. C., of Toronto, to the Rochester Y. C., of Charlotte, N. Y., has been accepted. The following correspondence passed between the two organizations:

Toronto, Sept. 10, 1904.—To the Rochester Yacht Club, Charlotte, N. Y.: The Royal Canadian Yacht Club hereby challenges for the Canada's cup, to be sailed for during the coming year.
Yours, truly,
STEPHEN HAAS, Com.
On behalf of the Royal Canadian Yacht Club, Toronto, Canada.

Rochester, Sept. 12, 1904.—To the Royal Canadian Yacht Club: The Rochester Yacht Club hereby accepts your challenge for the Canada's cup. Yours truly,
WM. H. BRIGGS, Vice-Com.
On behalf of the Rochester Yacht Club, Rochester, N. Y.

The conditions governing the match for the Canada's Cup to be sailed between yachts representing the Rochester Y. C. and the Royal Canadian Y. C., are as follows:

Rules.—The racing rules shall be those of the Yacht Racing Union of the Great Lakes as existing at this date, subject to such additions and variations as are herein provided, and in accordance with the Deed of Gift, dated Jan. 16, 1897.

Construction.—The yachts shall be of wooden construction, in accordance with the scantling tables in the rules above mentioned.

Size of Yacht.—The competing yachts shall be in the 30ft. L.V.L. class.

Number of Races.—The winner of three out of five races shall be declared the winner of the match.

Date of Races.—The first shall be sailed on Saturday, Aug. 12, 1905, and the other races on consecutive days thereafter until completed, Sundays excepted.

Courses.—The races shall be sailed on Lake Ontario off Charlotte Harbor on courses to be hereafter agreed upon.

The first shall be a triangular course.

The second shall be windward or leeward and return.

The tug bearing the buoy shall start at the time the preparatory gun is fired.

The third and fifth shall be similar to the first.

The fourth shall be similar to the second.

The triangular races shall be twice around an equilateral triangle of 9 nautical miles.

The windward or leeward races shall be four nautical miles to windward or leeward and return. Twice around.

The triangular courses shall be so sailed that one side of the triangle shall be laid to windward (first if possible).

In windward and leeward races all buoys shall be left to starboard, and in triangular races all buoys shall be left to starboard or port, as directed by the judges.

Time.—All races shall be started at 11 o'clock A. M.

Any race not sailed in 5½ hours by the winning yacht shall be resailed.

The start may be postponed by the judges:

1. In case of fog.

2. If, in their opinion, the space around the starting line is not sufficiently clear at the time appointed for starting.

3. In case both yachts consent to a postponement.

4. In case of serious accidents to either yacht, as hereinafter provided.

5. Should such a course appear to them desirable.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

RECENT SALES AND CHARTERS.—The following transfers have been made through the agency of Mr. Stanley M. Seaman, New York: Auxiliary catboat Keystone, Mr. Ernest M. Bull to Mr. Frederick T. Mason, New London, Conn.; Sloop Kangaroo, O. F. Smith, to Mr. C. W. Wright, Brooklyn, N. Y., and the jib and mainsail Knave, W. N. Bavier, to Mr. E. Hope Norton, of New York City.

NATIONAL ASSOCIATION OF ENGINE AND BOAT BUILDERS.—A meeting of the executive committee of the National Association of Engine and Boat Manufacturers was held Tuesday evening, September 13, at the Hotel Manhattan, Madison avenue and Forty-second street, New York city. Several matters of importance concerning the welfare of the Association, as well as matters pertaining to the National Show, were discussed. The report of the committee appointed at the last session of the executive committee, held prior to this meeting, was received and unanimously adopted, and it was finally decided that a National Show be given under the auspices of the National Association of Engine and Boat Manufacturers and the Sportsmen's Exhibition Company, to be known as the Motor Boat and Sportsmen's Show. The dates selected were from February 21 to March 9, 1905, and the place Madison Square Garden, New York city. This will be the first National Show the engine and boat-building industry has ever held, and from the assurances given by the officers and members of the Association, it will be the largest exhibit ever given in this country, and in connection with the Sportsmen's Exhibition Company will give the public a show such as has never before been given. The chairman of the executive committee announced the appointment of the following committees—Committee on Legislation—J. H. Schoonmaker, chairman; A. Snyder, E. A. Riette, J. M. Truscott; Committee of Exhibition—Henry R. Sutphen, chairman; J. S. Bunting, A. Massenet, S. J. Matthews; Committee on Transportation—H. R. Lozier, Jr., chairman; J. S. Bunting, H. N. Whittelsey, J. B. Smalley. The following were elected to membership: Active, Mr. James Craig, Jr.; Mr. W. L. Fay, representing Fay & Bowen Engine Co.; Mr. R. B. Clark, representing Giant Gas Engine Co.; Mr. Morris M. Whitaker, representing the Canada Launch Works. Associate—Mr. C. R. Mabley, representing Smith & Mabley, Inc.; Mr. Charles F. Splittorf.

OCEAN CITY Y. C. OFFICERS.—At a meeting of the Ocean City (N. J.) Y. C., the following officers were elected: Com., C. Howard Schermerhorn; Vice-Com., R. R. Sooy; Sec'y, Rolla Garretson; Treas., Senator Lewis M. Cresse; Trustees—W. Scott Hand, Oswald J. De Rousse and Dr. C. E. Edwards; Executive Committee—Charles F. Wall, L. M. Cresse, John N. Zurn, J. H. F. Dixon, H. F. Stanton, T. S. Mitchell, and George W. Powell.

OCEAN RACE TO SHELburne, N. S.—Some members of the Shelburne Y. C., of Shelburne, N. S., are trying to interest the Eastern Y. C. in an ocean race, the course to be from Marblehead to Shelburne. We trust the plan will be consummated, as such a race would afford fine sport, and open up some new cruising grounds to the Eastern men.

LAUNCH BUILDING AT HUNTINGTON'S YARD.—There is building at the yard of the Huntington Mfg. Co., New Rochelle, a 38ft. launch from designs made by Mr. R. M. Munroe. The boat will be used in Florida. The work of hauling out at this yard has been going on for some time past, and there is already a number of boats on the beach and in the basin.

CALYPSO-CHEWINK III. MATCH RACE A FAILURE.—A match race arranged by the Regatta Committee of the Southern Y. C. between the crack 25-footer cabin sloops Chewink III. and Calypso, which have been racing pretty hard ever since their advent South, resulted in a dismal failure of the "drifting match" sort on Saturday, September 10.

LARGE PRIZE OFFERED FOR FIRST MOTOR CRAFT CROSSING ATLANTIC.—Mr. G. L. Charley has offered \$10,000 for the first motor boat to cross the Atlantic. The proposition has aroused interest among the manufacturers on both sides of the Atlantic. The conditions governing the event are so vague that that matter can hardly be discussed intelligently at this time. That the plan is perfectly feasible there is no question, for a small kerosene launch—the Abel Low—has already made the passage.

NORTHPORT Y. C. ELECTION.—At the annual meeting of the Northport Y. C., held a few days ago, the following officers were elected: Com., J. B. Morrell; Vice-Com., Charles Van Iderstine; Flag Officer, Raymond Morse; Sec'y, H. Davis Ackerly; Treas., Murray S. Brown; Trustees—Edward Thompson, J. B. Morrell, J. W. Hiltman, H. Davis Ackerly, D. P. Morse, N. S. Ackerly, and Charles Van Iderstine. The treasurer's report showed the club to be in a flourishing condition. There now is a balance on hand of \$2,375.

YACHTS DAMAGED BY GALE.—A N.E. gale that had been moving up the coast broke on this neighborhood on Tuesday, September 15. The wind reached a velocity of seventy miles, and was accompanied by a continued and heavy downpour of rain. Much damage was done all along the coast, and shipping of all kinds suffered severely, although not to the extent it did in the gale of a year ago. The last gale in which yachting interests suffered severely happened on Thursday, September 17, which was almost a year ago to the day.

Yachts both large and small were swept ashore along Gravesend Bay, New Rochelle, Glen Cove, and Oyster Bay, and all were more or less damaged. Reports state that considerable damage was done on the New Jersey coast.

BOSTON Y. C.—STATION AT MARBLEHEAD.

The old sloop Orion dragged ashore at Sea Gate and tried conclusions with the breakwater off the Atlantic Y. C. The owner, his family, and the crew were rescued without difficulty, but the boat was badly damaged.

The big schooners Lasca and Endymion went ashore at a point about half way between Coney Island Point and the Atlantic Y. C. house. Both were pulled off uninjured.

The schooner Loyal dragged her anchors and collided with the racing sloop Baghera, the cutter Isolt, and the little racing sloop Trouble. Isolt came down on Vivian II. and Era. Wraith went ashore and lost her bowsprit.

At Oyster Bay and Cold Spring the shore was strewn with yachts in a more or less disabled condition.

Fortunately no lives were lost, and no serious accidents reported. Yacht owners who remain in commission during the fall should look to their moorings and ground tackle.

RAINBOW DISABLED.—Virginia and Rainbow were to have sailed the first of a series of match races under the auspices of the New York Y. C. on Thursday, September 15. The N.E. gale that had been blowing for the two days previous had let up, but the wind had worked around to N.W., and was blowing with a strength of over thirty miles. The Regatta Committee, consisting of Messrs. S. Nicholson Kane, Paul Eve Stephenson, and Eugene Lentillon, were on board Mr. R. A. C. Smith's steam yacht Privateer. The starting line was off Mott's point, Hempstead Harbor. The preparatory signal was made at 2 o'clock, and the starting signal at 2:10. Rainbow was under full mainsail and jib, while Virginia had two reefs tied in. Rainbow had the best of the start, and was coming down to the line when the main sheet slipped on one of the bits, allowing the boom to bring up against the mast head runner. The boom was sprung, and the yacht was taken in tow by her tender, Mirage, and taken to City Island. Virginia withdrew after the accident, and the race was off.

ONE-DESIGN CLASS FOR SEA CLIFF Y. C.—Some twelve members of the Sea Cliff Y. C. have agreed to build from one-design moderate sized jib and mainsail boats. The new class is in the hands of a committee composed of Messrs. Allan Pirie, Harry North, and W. S. Silkworth.

DODGER LAUNCHED.—The big gasoline yacht Dodger was launched at Woods' yard, City Island, on September 13. The boat is built of steel from designs by Messrs. Gardner & Cox. She is 90ft. waterline, 94ft. 4in. over all,

and she will develop a speed of 23 miles. Dodger was built for Mr. H. I. Pratt, and she is equipped with two 250 horse-power gasoline engines. Her fuel tanks have a capacity of 1,000 gallons. The boat is very roomy below and her quarters will be comfortably fitted up.

Knickerbocker Y. C.

College Point, Long Island Sound—Saturday, Sept. 17.

ONE of the features of the ladies' day programme of the Knickerbocker Y. C., held on Saturday, Sept. 17, was the race for launches. The course was from College Point to Gangway buoy and return—15 Miles.

Mercedes VI. and Catch Me made their maiden appearance in the racing field. Mercedes VI. won easily, beating Catch Me 17m. 27s. Catch Me started in order to give Mercedes VI. a race, and the former ran out of fuel before she finished.

In the open launch class Effie won. Dolphin carried off the honors in the canopy top launch class.

Besides the motor boat races, there were classes for sailing yachts. There were thirteen starters in five classes. All the starters covered an 8-mile course, except the Hampden dories, and they went only 4 miles.

In the 43ft. class Pailite II., a "Gil" Smith production, was beaten by Gurnard on corrected time. Ouananiche was the winner in the 30ft. class on corrected time. The other winners were: Irene, Shovonne and Indian. The summary:

Open Launches—Start, 3:00—Course, 15 Miles.		
	Finish.	Elapsed.
Esgeka, H. Kuhler.....	5 05 40	2 05 40

BOSTON Y. C.—STATION AT HULL.

Manhasset Bay Y. C.

Port Washington, Long Island Sound—Saturday, Sept. 17.
The annual fall regatta of the Manhasset Bay Y. C. took place on Saturday, Sept. 17. The twenty-seven boats that started in the race were favored with light breezes that blew from almost every quarter. At the start it was S.W., a little later it went to S.E. After veering to N.W. it finally went back to S.W.

The Regatta Committee, made up of Messrs. Charles D. Mower and Fred A. Hull, were on board Commodore A. H. Alker's steam yacht Florence. They sent the boats over a 10 $\frac{1}{2}$ -mile triangle. The start was made off Execution Light, from there the boats went to Matinecock buoy, thence to Scotch Caps and back to the starting line.

None of the 70-footers turned up, and the "bronze sixties" having gone out of commission, the largest boats to start were the 30-footers. Nike, having no competitor in the 30ft. class, went up and sailed against Spasm in the 30ft. class. Nike won by 6m. 24s. corrected time.

Of the five starters in the 25ft. class, Una had a shade the better of Snapper and won by 9s. Gloria and Corona have yet to be measured before their corrected time can be figured.

Jeebi captured first in the 21ft. class, Luto II. was next and Gazabo third. Skip was not measured.

Only two of the Larchmont 21-footers came to the line. Vaquero II. not only defeated her only competitor, Dorothy, easily, but led the fleet all over the course.

It is seldom that only two starters are seen in the raceabout class. Tartan and Mavis were the only contestants that materialized. Tartan won by less than a minute.

In the Indian Harbor Y. C. one-design class Kenoshi had no difficulty in disposing of Anawanda, her only competitor.

Plover won in the 18ft. sloop class. Arizona and Chickeoka had a fair race in the Manhasset Bay one-design class. Chickeoka won, and Pup, the third starter, was hopelessly beaten.

The raceabout Maryola and the little sloop Virgeth sailed together in a special class. Maryola won. Mr. Charles J. Lincoln's dory No. 7 won in her class. The summary:

Sloops, 36ft. Class—Start, 12:30—Course, 10 $\frac{1}{2}$ Miles.	Finish.	Elapsed.	Corrected.
Spasm, E. D. King.....	3 19 41	2 49 41	2 49 41
Nike, V. I. Cumnock.....	3 18 44	2 48 44	2 43 17

Sloops, 25ft. Class—Start, 12:20—Course, 10 $\frac{1}{2}$ Miles.	Finish.	Elapsed.	Corrected.
Una, W. B. Duncan, Jr.....	3 31 46	3 11 46	3 11 46
Snapper, F. S. Page.....	3 33 00	3 13 00	3 11 55
Firchly, G. P. Granberry.....	3 52 33	3 32 33	3 32 33

New York C. C.

Bensonhurst, L. I.—Saturday, Sept. 17.

The open fall regatta of the New York C. C. and the last of five races to count on the season's championship of Gravesend Bay took place on the afternoon of Saturday, Sept. 17. Twenty-six craft entered the contest. The winners were Maydic, Bobtail, Lizana, Ogeemah, Beta, Esperance and Martha M. Sandpiper scored a sauover. Winners of championship honors in the different classes will not be definitely known until corrected returns are sent to the secretary of the Association by the Regatta Committees of the component clubs.

The race was sailed in a light breeze, which was blowing from the S.E. at the start, but slanted into the S.W. before the end. Nearly half of the starters were becalmed just before the finish. The last boat to complete the journey did not cross the line until after sunset.

The regular Association courses were sailed, leaving all marks to starboard. Starters in Classes M and N had a pair of close hauled hitches from the start off Ulmer Park to the Sea Gate mark, another reach, on which baidooners were carried, to the Craven Shoal buoys, a run from there to Fort Hamilton, a reach to the Marine and Field Club mark and a close-hauled leg home. The journey was covered twice, aggregating 10 knots. The other craft sailed the same course, omitting the Craven Shoal buoys. The leg across the bay from Sea Gate to Fort Hamilton was a reach.

Maydic, Lizana and Ogeemah did the best work of the day. Era and Miss Judy were disqualified for fouling at the start. The latter was the first of the Class Q craft to end the race. A resumé of the season will appear on some future date. The summaries follow:

Sloops, Class M—Start, 3:05.	Finish.	Elapsed.	Corrected.
Maydic, W. H. Childs.....	4 52 40	1 47 40	1 47 40
Red Wing, J. B. O'Donohue.....	5 09 00	2 04 00	2 02 04

Sloops, Class N—Start, 3:05.	Finish.	Elapsed.	Corrected.
Bobtail, E. F. L.....	5 12 05	1 52 05	1 52 05
Era, E. H. M. Roehr.....	Disqualified		

Sloops, Class P—Start, 3:10.	Finish.	Elapsed.	Corrected.
Lizana, D. S. Wyne.....	4 39 55	1 39 55	1 36 18
Naiad, Dr. J. B. Palmer.....	4 52 11	1 42 11	1 41 11
Bunito, Haviland Bros.....	4 59 48	1 49 48	1 47 35
Smoke, L. H. Dyer.....	5 01 18	1 51 18	1 51 18

Sloops, Class Q—Start, 3:15.	Finish.	Elapsed.	Corrected.
Ogeemah, Alfred Mackay.....	5 00 52	1 43 52	1 42 41
Mary, Max Grundner.....	5 05 58	1 50 58	1 50 21
Trouble, W. A. Barstow.....	5 08 58	1 53 58	1 53 58

Colleen, W. F. Kemney.....	5 19 03	1 54 03	1 54 03
Orient, Richard Rummell.....	Did not finish.		
Rascal, D. G. Whitlock.....	Did not finish.		

Edgewood Y. C.

Narragansett Bay, R. I.—Saturday, Sept. 17.

The last of the three fall races of the Edgewood Y. C. was sailed Saturday afternoon, Sept. 17, and with this event the yachting season in Narragansett Bay practically comes to a close. This final event was an open regatta, but there were only eight entries all told, including three outside craft. The winners were the cats Elizabeth and Rival No. 1, and the knockabout Hope.

There was a light N.W. breeze that shifted to the S.W. and freshened materially at times, so that a fairly good race was held.

Interest centered in the work of the two 30ft. cats Mblem and Elizabeth, which have been rivals for first honors all the season. Elizabeth got away first by 2s., but Mblem had the best position, and led over the first round by 10s. Then Elizabeth forged ahead and secured the lead, gradually opening out the distance until she finished nearly 3m. ahead. Including this final race, Elizabeth has won ten races this season and Mblem has taken eight. Mblem, however, wins the Edgewood "cock of the walk" pennant, on points, as she was already two points ahead of Elizabeth on the season, and with the last event gained one more to Elizabeth's two, making a total of 45 to 44.

Rival No. 1, sailed by Harvey J. Flint, of Wanderer III., was successful in the 25ft. class, defeating Mae Hope by more than 11m. In the knockabout class the winner was Hope, a Herreshoff one-design 15-footer, owned by R. Colt, a son of Col. Samuel P. Colt, of Bristol, which defeated Terror by 11m.

Priscilla, the Wood brothers last fall river sloop, came over with the hope of again engaging Little Rhody, but as she had no competitor, she did not start.

The course was a short triangular one, sailed three times over, and giving a total distance of 11 miles. Messrs. A. C. Davis, Fred Gammell and Fred Griffith, of the Edgewood Y. C. Regatta Committee, acted as judges. The summary:

Knockabouts—Start, 2:29.	Finish.	Elapsed.
Hope, R. Colt.....	5 12 50	2 43 50
Terror, W. L. Frost.....	5 23 48	2 54 48
Martha, W. S. Baxter.....	Did not finish.	

30ft. Cats—Start, 2:41.	Finish.	Elapsed.
Elizabeth, W. D. Wood.....	4 44 33	2 03 33
Mblem, G. E. Darling.....	4 47 29	2 06 29

25ft. Cats—Start, 2:43.	Finish.	Elapsed.
Rival No. 1, C. Mays.....	5 01 50	2 18 50
Mae Hope, D. C. Stranger.....	5 13 10	2 30 10

Riverton Y. C.

Riverton, Delaware River—Saturday, Sept. 10.

The first power boat race of any importance to be held on the Delaware River was given by the Riverton Y. C. on Saturday, Sept. 10. The Riverton Y. C. is to be congratulated on the showing made, for the race was better in many respects than any given on Long Island Sound, where there are many more motor craft.

The course was 10 $\frac{1}{2}$ miles, starting at Riverton pier, up the river to red spar buoy No. 52, down to black buoy No. 41, twice around.

The races were held under the American Power Boat Association rules. There were fifteen starters, and all but three finished. The light N.E. breeze was not strong enough to make the water rough. The winners were Nada III. and Unique. The summary:

First Class.	Finish.	Elapsed.
Lovica, C. B. Mitchell.....	Withdrew.	
Elizabeth, F. F. Wachter.....	4 32 22	1 57 13
Maude Blair, John Blair.....	5 26 12	1 42 48
Wizzard, R. R. Bender.....	5 25 55	1 41 49
New Jersey, France.....	Withdrew.	
Anna Belle, W. H. Wolstencroft.....	5 38 00	1 47 14
Nada I., Helen Godschalk.....	5 03 08	1 03 27
Nada III, Clarence Godschalk.....	5 01 52	1 02 11

May, J. F. Machell.....	Finish.	Elapsed.
Withdrew.		
W. Schmitt, L. E. M. Byers.....	5 44 58	1 42 07
Nan, Otto Holzworth.....	5 22 48	1 18 40
Red Devil, George N. Bakely.....	5 16 33	1 06 45
Now Then, Dr. Ruch.....	5 21 28	1 11 40

40ft. Class.	Finish.	Elapsed.
Boomerang, E. H. Godschalk.....	5 18 06	1 01 48
Unique, H. E. Dantzebecker.....	5 27 46	0 58 53

Beverly Y. C.

Wing's Neck, Buzzard's Bay—Saturday, Sept. 10.

The Beverly Y. C. sailed its 362d regatta on Saturday, Sept. 10, in a W.S.W. breeze. Mr. R. W. Emmons, 2d, acted as judge. The winners were Praxilla, Maora, Jap, and Fiddler. The summary:

One-Design 30-footers.	Finish.	Elapsed.
Praxilla, J. Parkinson, Jr.....	3 46 50	
Young Miss, D. Whittemore.....	3 50 54	
Arabian, R. Winsor, Jr.....	Did not finish.	

Fourth-Class Cats.	Finish.	Elapsed.
Maora, A. W. Whiting.....	2 56 55	
Howard, Howard Miller.....	2 53 43	

One-Design 18-footers.	Finish.	Elapsed.
Jap, G. P. Gardner, Jr.....	2 21 12	
Hindoo, N. F. Emmons.....	Did not finish.	

One-Design 15-footers.	Finish.	Elapsed.
Fiddler, Miss Dabney.....	1 18 59	
Teazer, Mrs. R. W. Emmons, 2d.....	1 19 07	
Ranzo, Maurice Richardson.....	1 19 30	
Compress, S. M. Weld.....	1 20 01	
Fly, Miss Williams.....	1 21 07	
Vim, D. Sargent.....	1 21 08	
Uarda, The Misses Emmons.....	1 24 45	

Season championships were won by the following boats: 30-footers, Young Miss; 21-footers, Terrapin; 18-footers, Jap; 15-footers, Fiddler.

Ladies' cup for best record of the season: 15-footers, won by Teazer, Mrs. R. W. Emmons, 2d; fourth-class catboats, not decided, owing to protest.

Canoeing.

A. C. A. Meet.

Sugar Island, St. Lawrence River—Aug. 11 to 18.

Thursday, Aug. 11, 1904.

Event No. 6. Unlimited Sailing Race.—Six miles; limit 2 $\frac{1}{2}$ hours; open to any canoe coming within the A. C. A. rules. Weather showery and squally; wind west, strong; sea heavy. Start, 10:40:

	Finish.	Elapsed.
D. B. Goodsell.....	11 41 15	1 01 15
M. Ohlmeyer.....	11 45 45	1 05 45
W. W. Crosby.....	12 06 50	1 26 50
W. Carmalt.....	12 12 45	1 32 45
J. E. Zdzieniewicz.....	12 13 30	1 33 30

Event No. 17. Special Class Sailing Race.—Weather cloudy and threatening; wind north and strong; sea choppy. Decked class 3 miles; open class 1 $\frac{1}{2}$ miles. Start, 2:40:

Class A—Decked.	Finish.	Elapsed.
D. B. Goodsell.....	3 10 00	0 30 00
F. C. Moore.....	3 10 40	0 30 40

Class B—Open.	Finish.	Elapsed.
W. W. Crosby.....	3 07 25	0 27 25
E. F. Wyer.....	3 32 00	0 52 00

Event No. 14. Novice Sailing Race.—Three miles; limit 1 $\frac{1}{2}$ hours; weather cloudy; wind north; sea moderate. Start, 4:25:

	Finish.	Elapsed.
Ralph Britton.....	5 03 30	0 33 30
B. F. Cromwell, Jr.....	Withdrew.	

Friday, Aug. 12.

Event No. 15. Club Sailing Race.—Once around Sugar Island. Weather clear; wind light, N.E.; sea smooth. Start, 10:30:

	Finish.	Elapsed.
F. C. Moore, N. Y. C. C.....	10 56 00	0 26 00
D. B. Goodsell, N. Y. C. C.....	10 57 45	0 27 45
E. A. Bennett, N. Y. C. C.....	10 59 05	0 29 05
A. W. Scott, K. C. C.....	11 07 10	0 37 10
L. A. De Camp, K. C. C.....	11 07 20	0 37 20
W. Carmalt, N. Y. C. C.....	11 13 50	0 43 50
E. J. Wright, N. Y. C. C.....	11 15 10	0 45 10
B. F. Cromwell, Jr., K. C. C.....	11 29 47	0 59 47

Won by New York C. C., having first three men finish.

Event No. 3. Sailing Record Race.—Four and one-half miles; limit 2 $\frac{1}{2}$ hours; weather cloudy; wind light, S.W.; sea moderate. Start, 2:40:

	Finish.	Elapsed.	Points.
D. B. Goodsell.....	4 00 55	1 20 55	6
F. C. Moore.....	4 01 30	1 21 30	5
E. A. Bennett.....	4 02 45	1 22 45	4
Ralph Britton.....	4 12 00	1 32 00	3
W. Carmalt.....	Not timed.		2
J. J. Hattenbrun, Jr.....	Not timed.		1

Event No. 13. Fours Paddling Race.—Double-blade, $\frac{1}{2}$ mile straightaway. Weather clear; wind none; sea smooth. Start, 4:41:45:

	Finish.	Elapsed.	Points.
Herb Begg, A. G. Mather, R. Britton, M. C. Berrien.....	4 45 25		
E. H. Stoner, E. H. Demmler, R. Owen, F. C. Demmler.....	4 45 35		
D. P. Mitchell, F. P. Land, E. A. Bennett, J. A. de Camp.....	4 45 50		
L. Danburg, B. F. Cromwell, Jr., A. Van Dohlen, J. J. Hattenbrun, Jr.....	4 45 20		

Last crew, though finishing first, was protested for taking water of first crew, and protest was sustained by Regatta Committee, thereby disqualifying the crew from position in the race.

Event No. 2. Paddling Record Race.—One-half mile straightaway. Weather clear; wind none; sea smooth. Start, 5:25:15:

	Finish.	Elapsed.	Points.
J. J. Hattenbrun.....	5 29 25	0 04 10	4
R. Britton.....	5 29 35	0 04 20	3
W. Carmalt.....	5 29 45	0 04 30	2

magnanimity and sportsmanlike qualities shown by Mr. Mather in the very embarrassing position in which he was placed. Special Event. Tail End Race.—one-quarter mile down the wind. Weather clear; wind very strong S.W.; sea rough. Race not timed; course not measured. First R. P. Nichols; second, H. O. Palmer; third J. E. Plummer, fouled finishing buoy; fourth, C. H. Parson, did not finish. A. M. Hannah and R. Britton were protested and protest sustained.

Event No. 22. Tilting Tournament:
First bout: Cromwell, tilter, and De Camp, paddler, beat Britton, tilter, and Mather, paddler.
Second bout: Danburg, tilter, and Hattenbrun, paddler, beat Zdzankiewicz, tilter, and Van Dohlen, paddler.
Third bout: Bouse, tilter, and Nichols, paddler, beat Ohlmeyer, tilter, and Reichert, paddler.
Milson, tilter, and Hannah, paddler, a bye.
Owing to lateness of the hour, committee called off tournament, to be resumed following morning.

Thursday, Aug. 18.
Event No. 22. Tilting Tournament, continued:
First bout: Danburg and Hattenbrun beat Cromwell and De Camp.
Second bout: Rouse and Nichols beat Milson and Hannah.
Finals: Rouse, tilter, and Nichols, paddler, beat Danburg, tilter, and Hattenbrun, paddler, and won the tilting championship of the A. C. A. for 1904.

Postponed Event No. 1. Combined Sailing and Paddling Record Race.—Weather clear; wind none; sea smooth. Start, 11:39.
Finish. Elapsed. Points.
R. Britton.....12 34 10 0 55 10 3
W. Carmalt.....12 33 13 0 56 15 2
J. J. Hattenbrun, Jr.....12 37 50 0 58 50 1

Note.—The result of the three record races gives the record for 1904 to Ralph Britton, of Gananoque, with 9 points; Carmalt, of New York C. C., and Hattenbrun, of Undercliff C. C., tied for second place with 6 points each.

Postponed Event No. 4. Trophy Sailing Race.—Nine miles. Weather clear; wind N. and puffy; sea moderate. Start, 2:30.

Finish.
Mab, F. C. Moore.....4 09 28
Buzard II., D. B. Goodsell.....4 12 54
Guenn, R. Britton.....Not timed.

Note.—F. C. Moore wins the sailing trophy of the A. C. A. for 1904.

Referee, R. J. Wilkin. Judges, E. A. Burns and J. W. Sparrow. J. K. Hand, clerk of the course.
Committee: H. M. Stewart, Chairman; F. C. Hoyt, C. P. Forbush and Herb Begg.

Palisades Park.

THE work of appropriating land along the New Jersey bank of the Hudson for the new Interstate Park, is practically completed, as there are only a few acres yet to be acquired. The park will extend fourteen miles along the west shore of the Hudson River. A magnificent boulevard will traverse the length of the park, running along the water's edge. In speaking of the project, the New York Herald had the following to say:

"There are several other phases of the Palisades Park project which are at present receiving the attention of the commission. There was a time when the Harlem River was practically the center for aquatic sports. The crowding of that channel has of late years been driving oarsmen and canoeists away, and they are looking for other places in which to establish their headquarters. On the west side of the Hudson they will find such a haven, is the belief of the commissioners.

"We feel quite certain," said Mr. J. Du Pratt White, the secretary of the commission, "that Palisades Park will be a place of resort for all who are interested in aquatic sports. The water is shallow along the western bank, and there will be splendid opportunities for rowing contests and also for canoeing. Many small sailboats, sloops, and catboats are constantly seen along that part of the river. There will be piers and landings established for their benefit. This will give the aquatic interests something of a home, and the ideal surroundings will make the park a place of resort which they will greatly appreciate.

"In fact, the commission is now doing all that it can in a small way to encourage these interests. No rowing will be permitted, and the unruly element will be kept away if possible. We are now patrolling our land to prevent any depredation being made by such persons, for the cutting down of valuable trees and the destruction of landmarks will not be permitted.

"We have always taken great pleasure in welcoming canoeists. Even at this time we are issuing permits to them to camp on the land. The canoeist is a scientific camper. He goes ashore, pitches his tent, establishes an abode which is a delight to the eye, and in half an hour, if need be, he can disappear, leaving no trace behind him. He does not spoil anything. He is too much of a gentleman and possessed of too much right feeling to deface objects of natural beauty. It is the intention of the commission to provide places where men of that class may establish camps. Every facility will be offered to them.

"Spots will be set aside for campers under the supervision of the commission. The unexcelled view of the river, the wild beauty of the place, and other conditions, should make the Palisades Park of especial interest to those who love an out-of-door life. There are now many campers along the shore, and on Saturdays and Sundays the small tents can be seen close to the edge of the river. There has been little trouble experienced from those who make temporary abiding places at that point, although, of course, the commission is obliged to see that no trees are cut down. In order that there may be no confusion and that the campers may not unwittingly trespass on private property, we are issuing permits. Those who hold them may then be able to select a desirable camping place in advance."

"That the Palisades reservation is becoming popular as a resort for campers, was seen on a trip to that region made recently by a reporter for the Herald, who set out in a sloop, starting from the New York side. On the western bank as far as Alpine were seen at intervals the small tents close to the shore. Here the campers had established themselves in the most comfortable fashion. A few of them had fires made from driftwood, but the majority used lamps of alcohol or kerosene for cooking. Small tables, supported by collapsible legs, were spread under the diminutive awnings. Camp chairs were set up in some of the abiding places. Back of the tables were small tents, where the campers might sleep. The water which they used was supplied by the clear spring which flows from the living rock. The sources of most of these springs are uncontaminated, and the water was clear, sparkling and deliciously cold.

"Model camps, indeed, were those which had been established by the canoeists. In the hold of the slender canoes, wrapped in stout brown canvas, was stored everything which was essential to make camp life a joy. From the canoes were brought forth material from which were built square tents, cooking apparatus and vessels,

and an apparently inexhaustible store of provisions. The canoeists extend their lines throughout the territory which is to constitute the Palisades Park.

"Many small sailboats and naphtha launches were lying off the Palisades reservation, while the occupants took a view of the towering cliffs and of the rich verdure and the jutting crags of the land which they were one day to possess. The opening of the park to the public will be appreciated by a large class of the population, of whom those seen on the day were the vanguard.

"Above the city there are many opportunities for fishing, and in the neighborhood of Englewood is a colony of fishermen which has for generations made its living from the river."

Sailing With Canoes.

IN addition to the scores who spend summer days aboard steam yachts, sailing vessels, and motor boats, there is quite a body of men in the city who prefer smaller craft for their pastime and give their spare moments to canoeing. To the real water lover canoe sailing has advantages over the management of larger boats, and attractions to be found in no other kind of aquatic sport.

Canoeing, more than any other kind of sailing, rests squarely on the skill of the man in the boat. There is little difference in the construction or character of canoes within a given class, which throws the responsibility for victory or defeat on the canoeist to an extent which is true with no other kind of vessel. Supremacy in canoe management comes only with years of experience, but once attained is a factor which can be depended upon to make good in all contests. There is no chance for an indifferent hand to win through the merits of a boat for whose workmanship he can claim no credit.

On this account canoeing has a personal element which makes it absorbing. It brings one into a closeness of touch with the water—sometimes more than a mere touch—which is its main charm. Many persons spend an afternoon on the water sitting in a wicker chair under the after deck awning of a trim steam yacht, and believe that they are fond of the water. What they are really fond of are the chair and the shade and the breeze and other things which usually go with the excursion.

The canoeist does not find his enjoyment of the water in that way. He is not a believer in homeopathic doses. He takes to the water in a spirit of comradeship for a rough-and-ready frolic. There is the same difference between sailing a canoe and traveling on a steam yacht as between horseback riding and driving in a buggy.

In canoe racing one does not wear a yachting cap and white duck trousers. He goes out in a costume which will serve him equally well in the water and out of it, balancing himself within reaching distance of its surface as his canoe skims the waves, conscious of, but indifferent to, the fact that a trifling accident or error of management may immediately eliminate this distance, turning the contest for him into a swimming and not a canoe race. Of course, it is assumed that he can swim. Swimming should be regarded as a prerequisite to any kind of yachting, but is an indisputable necessity in canoeing.

To the spectator also canoe sailing offers some distinct advantages over other exhibitions of watermanship. The majority of yacht races are uninteresting to the observer on shore. To see the maneuvering of the race and get into the spirit of the contest, it is necessary to be aboard one of the competitors or some official boat having the freedom of the course. At best the most one can usually expect to see is the finish, and often this is so scattered as to lose all the elements of a contest. With canoes it is different. The races are for short distances, usually not much over a mile, and are held on smooth water inshore, where they may be followed perfectly by the spectators. There is no long delay with the boats in the remote distance or out of sight waiting for the finish. Several canoe races can be sailed while the vessels in a big yacht race are coming to the starting line, and a regatta of a dozen events can be concluded in less time than a single race among larger boats. Then, too, the unexpected is constantly happening in canoe races. This relieves any race from dullness and keeps the attention of the onlookers fixed on the contest from start to finish.

Canoeing is naturally less popular in a seaboard town than inland. The majority of expert canoeists are to be found away from the coast, usually on fresh water lakes and adaptable rivers. With so many other kinds of boating and water sports, one is apt to be diverted toward something else unless he was brought up to it in another locality.—New York Post.

Red Dragon C. C.

ON Saturday, Sept. 10, the Red Dragon C. C., of Philadelphia, held the fall regatta of its 21st racing season at the club house, Wissinoming, Pa.

The ideal weather favored a large gathering, and the various events were well contested by amateur canoeists from different organizations along the Delaware River. The most interesting event for the Red Dragons was the club trophy race. This is the half mile paddling championship of the club, and is always closely fought among its best blade handlers. All contestants used the regulation racing model, Mr. Edward K. Merrill being the winner; time, 3:10. M. D. Wilt, a close second. MacLister and Mitchell were the other entries.

Mr. Merrill, the victor, is one of the younger members of the club, and he used a canoe of his own design and construction, thereby deserving more than usual credit.

Other events of an exciting nature were the broom race, tilting tournament, double blade half-mile, and tandem single blade. In all but the double blade the Red Dragon members carried off the first prize. In all of the races first and second prizes were offered, all being handsome and appropriate trophies to the lucky winners. The events and winners follow:

Broom race—Won by E. K. Merrill; second, T. L. Hammersly. Time, 1m.

Club trophy, ½ mile—Won by E. K. Merrill; second, W. D. Wilt. Time, 3:10.

Tilting tournament—Won by Merrill and Wilt; second, Lewis and Hammersly.

Double blade, ½ mile—Won by H. C. Hammersly; second, W. D. Wilt. Time, 2:05.

Tandem single blade, ½ mile—Won by Wilt and Merrill; second, Hammersly and Tompkins. Time, 3:27.

The swimming, hand paddling and tandem double blade races were called off on account of darkness.

Officials: Starter, H. W. Fleishmann; timekeeper, Fred W. Noyes; judges, Joseph Edward Murray, Clifton T. Mitchell.

WILL K. PARK.

PHILADELPHIA, Pa., Sept. 15,

Park Island C. C.

SOME two hundred persons were present at the Park Island C. C., of Trenton, N. J., held at Park Island on Monday, Sept. 5. The officials were: Starter, Arthur Wood; judges, D. B. Goodsell and William Holcombe; clerk, T. C. Moore; referee, D. B. Goodsell.

The summary follows:

DOUBLE BLADES, TANDEM, LADY AND GENTLEMAN, ½ MILE.

1. C. W. Stark, Miss Wood, P. I. C. A.
2. T. L. Hammersly and wife, Monte Cristo C. C.
3. F. W. Donnelly and wife, P. I. C. A.

SWIMMING RACE, OPEN, 100 YARDS.

1. G. S. Morrissey, N. Y. C. C.
2. E. A. Stark.

SWIMMING RACE, P. I. C. A.

1. R. G. Lucas, P. I. C. A.
2. J. A. Fritz, P. I. C. A.

TILTING TOURNAMENT.

1. Frederick Gilkyson, F. W. Donnelly, P. I. C. A.
2. P. K. Tompkins, D. W. Anders, Monte Cristo C. C.

BROOM RACE, 100 YARDS.

1. W. B. Maddock, P. I. C. A.
2. H. T. McNiece, P. I. C. A.
3. G. S. Morrissey, N. Y. C. C.

TANDEM OVERBOARD, 100 YARDS.

1. Frederick Gilkyson, M. S. West, P. I. C. A.
2. F. W. Donnelly, W. A. Furman, P. I. C. A.
3. W. B. Maddock, C. R. Smith, P. I. C. A.

DOUBLE BLADES, ¼ MILE.

1. Chas. W. Stark, P. I. C. A.
2. M. D. Wilt, Red Dragon C. C.
3. Geo. S. Morrissey, N. Y. C. C.

DOUBLE BLADES, TANDEM, ¼ MILE.

1. C. W. Stark, H. T. McNiece, P. I. C. A.
2. F. W. Donnelly, P. I. C. A.; J. K. Hand, N. Y. C. C.
3. H. A. Hill, M. C. Hill, P. I. C. A.

SINGLE BLADES, ¾ MILE.

1. M. D. Wilt, R. D. C. C.
2. E. D. Anderson, P. I. C. A.
3. G. S. Morrissey, N. Y. C. C.

SINGLE BLADES, TANDEM, ¼ MILE.

1. P. K. Tompkins, D. W. Andrews, Monte Cristo C. C.
2. H. P. Moorhead, C. W. Stark, P. I. C. A.
3. F. W. Donnelly, H. T. McNiece, P. I. C. A.

HAND PADDLING, 100 YARDS.

1. E. D. Anderson, P. Q. C. A.
2. H. A. Hill, P. Q. C. A.
3. Chas. R. Smith, P. Q. C. A.

CANOEING NEWS NOTES.

CANOEES SOLD TO THE HAWAIIAN ISLANDS.—Two of the cruising class canoes designed by Daniel B. Goodsell in 1903, have been sold to sportsmen in the Hawaiian Islands. If they prove satisfactory, a number of others will be built. One of the creations captured the Elliot trophy this year at the annual meet of the Atlantic Division of the American Canoe Association. The boats are 17ft. over all, 13ft. 9in. on the waterline, 3ft. 6in. beam, and 5in. draft. They are designed to a displacement of 52 pounds, and carry 140 square feet of canvas. The two which have been sold are to be shipped by rail to San Francisco, and will go from there by steamer to their new destination.—Brooklyn Eagle.

The Kennel.

The National Foxhunters' Association.

PRESIDENT WM. WADE has sent out the following circular relative to suitable localities for the annual meet: "For some years it has been impressed upon members of The National Foxhunters' Association that a trial should be held somewhere outside of Kentucky, and this feeling is quite as prevalent among Kentucky members as among those of other States. It should go without saying that but for the vigorous support of Kentucky, both in membership and entries, the association would have fallen to pieces long since, and members outside the State of Kentucky owe Kentucky members much for their work.

"But still, it is not well that the National Association should be set down as purely an institution of one State, no matter where that State may be, and to keep the idea alive that ours is a National Association, we must have meets outside Kentucky now and then.

"Therefore, I would be glad if you would express your views and your suggestions of suitable localities in States neighboring to Kentucky.

"The essential requirements for a meet are, foxes reasonably plenty; sufficient and good accommodations for those attending the meet; that horses fit for hunting are readily obtainable; that the country be reasonably open, and that the point is on some through line of railroad running through cars past that point. As an illustration of this point, any such station on the C. & O., Norfolk & Western, or Southern railroads in Virginia, western North Carolina, or Tennessee would be right.

"I hope it will not be concluded from the foregoing that it is determined the next trials shall be held outside of Kentucky, as the present intention is only to collect information as to good localities in other States.

"Therefore, it is hoped Kentucky members will give full information as to desirable locations they may know of. Awaiting your kind reply, I am yours very truly,

WM. WADE,

President National Foxhunters' Association."

Points and Flushes.

The premium list of the Sixteenth Annual Foxhound Field Trials and the Second Annual Foxhound Show, to be held by the Brunswick Fur Club, Barre, Mass., in October, can be obtained of the secretary, Mr. Bradford Turpin, Roxbury, Mass. Full information is given concerning classes, fees, etc. Entries close October 1.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Sept. 21.—Bristol, Conn., Gun Club tournament and sheepbake. E. R. Burwell, Sec'y.
Sept. 22.—Moberly, Mo.—Missouri League of Trapshooters.
Sept. 22-23.—Waterloo, Ia., Gun Club tournament; \$1,000 added. E. M. Storm, Sec'y.
Sept. 22-23.—Waterloo, Ia., Gun Club tournament.
Sept. 27.—Morgantown, W. Va.—Recreation Rod and Gun Club amateur tournament. Elmer F. Jacobs, Sec'y.
Sept. 27-28.—Manning, Ia., Gun Club two-day amateur tournament. G. A. Rober, Sec'y.
Sept. 28.—Concord, Staten Island.—Richmond Gun Club all-day shoot. A. A. Schoverling, Mgr.
Sept. 28-29.—Concordia, Kans.—The Interstate Association's tournament, under the auspices of the Concordia Gun Club. L. S. Myers, Sec'y. Elmer E. Shaner, Mgr.
Sept. 28-29.—Homer, Ill.—Homer-Ogden Gun Club tournament.
Sept. 29-30.—Centralia, Ill., Trapshooting Club tournament. T. W. Rice, Sec'y.
Oct. 4-5.—Crawfordsville, Ind., Gun Club tournament.
*Oct. 4-5.—Allegheny, Pa.—North Side Gun Club.
Oct. 6-7.—Dalton, O., Gun sixth annual tournament. Ernest F. Scott, Capt.
Oct. 6-7.—St. Marys, Pa.—Two-day shoot.
Oct. 10-11.—Carthage, Mo.—Seventh tournament of the Missouri League of Trapshooters. Dr. C. B. Clapp, Sec'y.
Oct. 12-13.—Sistersville, W. Va., Gun Club fall tournament. Added money to all events, and prizes. Ed. O. Bower, Sec'y.
Oct. 12-13.—Indianapolis, Ind., Gun Club fall tournament. James W. Bell, Sec'y.
Oct. 18-19.—Litchfield, Ill.—Consolidated Trapshooters' Congress.
Oct. 18-20.—New London, Ia., Gun Club tournament. Dr. E. C. Cook, Sec'y.
Oct. 26.—Concord, Staten Island.—All-day target shoot of the Mullerite Gun Club, on the grounds of the Richmond Gun Club. A. A. Schoverling, Mgr.
Nov. 1-3.—St. Louis Mo.—World's Fair shoot; live birds and targets. Alec D. Mermod, Mgr., 620 Locust street.
Nov. 17-19.—Tampa, Fla.—Tampa Bay Rod and Gun Club, \$400 added. J. A. Hansbrough, Sec'y.
*Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburg.

DRIVERS AND TWISTERS.

The next shoot of the Ossining, N. Y., Gun Club will be held on Oct. 1.

The programme of the Centralia, Ill., Amateur Trapshooters' Congress, provides two more contests, one on Sept. 29 and 30, the other on Nov. 3 and 4.

On Saturday of this week a return match is fixed to take place between teams of the Meadow Springs Gun Club and the S. S. White Gun Club, on the grounds of the former club, Philadelphia.

On the grounds of the Richmond Gun Club, Concord, Staten Island, a match is fixed to be held on Sept. 24, at 1 o'clock, between teams of the New York Athletic Club, Castleton Gun Club, and Richmond Gun Club.

On the Point Breeze race track, Philadelphia, the Point Breeze Gun Club weekly shoot on Sept. 17 is conspicuous by some good scores. Mr. Walter Harrison broke 90 out of 100 targets, and Mr. S. C. Aiman was a good second with 85.

The Garfield Gun Club, of Chicago, finished their seventh and last trophy shoot of the third series on Saturday of last week. These contests have been notable for the large number of contestants who participated throughout the series.

Mr. Phil B. Bekeart, of San Francisco, was a visitor in New York in last days of last week and the early part of this week. He journeyed toward Atlantic City, where he purposed to tarry for a short while, thence en route to the far Western coast.

The Montclair, N. J., Gun Club has provided a silver loving cup as a prize to the member making the longest consecutive run from Sept. 17 to Jan. 2, inclusive. The full conditions are posted in the club house. Mr. Edward Winslow is the secretary.

Mr. C. B. Clapp writes us as follows: "The seventh tournament of the Missouri League of Trapshooters will be held at Carthage, Mo., Oct. 10 and 11. Address J. P. Leggett, Carthage, Mo., or the secretary of the League, Dr. C. B. Clapp, Moberly, Mo."

At the regular monthly handicap of the Clearview Gun Club, at Darby, Pa., Sept. 17, Mr. Morris G. Bell led with 23 out of 25, but was tied by Dr. Charlton, the allowance of each completing a full score of 25. A shoot-off resulted in a tie of 25, then in a toss up, Dr. Charlton won.

Mr. Edward Banks, of the DuPont Company, Wilmington, Del., was a visitor in New York several days past, attending to business matters. He left for his home about the middle of this week. He reports gratifying progress in the growth of his egg plant, or, rather, his hen ranch. He seems to be gradually losing his fondness for New York, as might be expected, in view of the abundance of good sport, reed bird and rail shooting and fishing in season, with which Wilmington abounds.

The Secretary, Mr. J. A. Hansbrough, writes us as follows: "The first annual tournament at targets and live birds, given under the auspices of the Tampa Bay Rod and Gun Club, Tampa, Fla., will be held on Nov. 17, 18 and 19; \$400 in added money. Two days at targets and one day at live birds. During the week of South Florida Fair reduced rates on all railroads. For programme address the secretary."

The programme of the fourth annual tournament for amateurs, to be held on the Rising Sun Gun Club grounds, Rising Sun, Cecil county, Md., Oct. 5 and 6, announces that \$5 will be added. On the first day twelve events, each at 15 targets, \$2 entrance, \$1.50 added, will be provided. On the second day there will be ten events, of which nine are at 15 targets. The tenth will be at 40 targets, 80 cents entrance, and will determine the championship of Cecil county. It is open only to county residents. High amateur and professional averages will have \$4 each. Shooting begins at 10:30. Ship shells to the Rising Sun Gun Club. Sliding handicap, 16 to 20yds. Messrs. Cecil Kirk and H. Linn Worthington will manage the shoot.

BERNARD WATERS.

Chicago Trapshooters' Association.

CHICAGO, Ill., Sept. 15.—The Chicago Trapshooters' Association tournament, held Sept. 9, 10 and 11, at their grounds at Watson's Park, Burnside, was the most successful target tournament held in Chicago since the times when the State shoots were held here.

The officers of the Association put forth a good programme, with plenty of special races and merchandise prizes to make it worth while to have shooters go a good distance from home to attend, this shoot, and they certainly did come from many parts. The first two days were beautiful days for the sport, with the exception of a pretty stiff incoming wind. The last day it rained, but not enough to hinder finishing the programme in good time.

The details of the shoot were in the hands of E. B. Shogren, secretary of the Association, and Fred Lord and H. W. Viemeyer. The cashier's office was in charge of C. A. Shogren and Leslie Standish, who gave valuable assistance in making up the squad sheets and getting the squads up to the traps.

Seventy shooters took part in all or part of the events of the three days, and as it is the open season, many Chicago shooters were away on their annual hunts who otherwise would have been in attendance.

Ten professional shooters were in attendance, and considerable interest was taken in the work done by these men. When such good men as W. R. Crosby and Fred Gilbert strike town there is bound to be something doing in the shooting line. And then there was Tom Marshall, Frank Riehl, C. A. Young, John Boa, Cadwallader, Fred Lord, H. W. Viemeyer and Keck, the one-armed wonder.

W. R. Crosby again gave some of his remarkable performances at target smashing, and was in the lead each day, missing but 5 the first day out of 180 and 9 each of the next two days, getting a total score of 514 out of 540 targets. Fred Gilbert was easily next with a total of 504 out of 540 for the three days, Marshall getting 492, John Boa 491, and C. A. Young 490.

Among the amateurs Lcm Willard, Chicago's best amateur trap shot, was first, with a total of 491 out of 540. O. N. Ford, of Central City, Ia., was second with 490. Kit Shepardson, of La Grange, Ind., third with 376. Guy Burnside, of Knoxville, Ill., fourth with 375.

Most interest centered in the autumn handicap trophy race on the afternoon of the second day, which was at 50 targets, with \$50 added to the purse, and the \$50 trophy cup. Handicap from 16 to 20yds. There were thirty-eight entries in this event, and at the close of the race Max Kneussl, of Ottawa, Ill., and R. L. Slimmer, of Clarksville, Ia., were tied with 46, and after three shoot-offs, the cup finally went to Kneussl. These shoot-offs were greatly enjoyed by the shooters and large number of spectators present, as the shooting abilities of these two men were about on a parity.

On the last day the special feature was the consolation handicap trophy race of 25 targets, with twenty-six entries; \$25 was added to the purse, and the cup, valued at \$25, to go to the winner. Lem Willard, Shepardson and W. D. Stannard tied with 24 each. On the first shoot-off Willard and Stannard again tied with 22 each, Shepardson dropping one less. On the final shoot-off Stannard broke 24 and Willard 19, which gave the cup to Stannard.

Notes on Tournament.

The wind played havoc with good scores the second day—incoming. My, how those targets did climb!

The Indiana boys showed up in good numbers. Come again, boys.

Dr. Hann came from Texas, and got in first money in the 25 target race on Friday.

You ought to see the "smile that won't come off" on the faces of Lord and Viemeyer.

Crosby held up his reputation as the greatest of target shots.

Chief Iron Man kept the honors at home by winning first average.

Fred Gilbert dropped more targets than is customary with him. The uncertain flight of the targets will make even the best miss some.

Hanagan was the only one to get 25 straight in the big race. The cup seemed to be his then, but they all fell down at the second trap.

Tom Marshall said that Chicago has finally awakened, and should soon be the greatest of trapshooting cities.

Burnmeister, Gilbert's side partner, was badly out of form.

Burnside won two pairs of ball-bearing oarlocks the first day. Hanagan won an Ithaca gun and a Bristol steel rod. J. R. Graham got a Marlin 16-gauge repeating shotgun. Willard got a set of shooting pictures. Loring got a gun case and a shooting coat. Stannard and Scott each got a gun case, and nearly every shooter won an ideal gun cleaner for making a straight.

Just as the first squad had finished the first event the last day it commenced to rain, and it looked for a while as if it would put a stop to the game for the rest of the day; but it soon cleared up, although being cloudy all day.

Kneussl said he was afraid to go through the heart of the city with that big cup under his arm—a little bit scary about the hold-up men.

The greatest proportion of the shooters indorsed the system of equal moneys, and more shot through because of this.

Geo. Roll tried to shoot a new gun, and then he quit after the second day.

E. W. Bird came from Fairmount, Minn., to see how we run a shoot here.

W. A. Davis, formerly secretary of the Paducah, Ky., Gun Club, is now a Chicagoan, and came out and shot in a few events.

Over twenty home shooters shot through a day's programme.

WESTERN TRAP.

JACKSONVILLE, Ill., Sept. 15.—The second shoot of the circuit of Illinois tournaments now in progress was held here Sept. 13 and 14. There were the best of the Illinois trap shots, together with seven traveling men. The full delegation of Illinois men were present, viz., Viemeyer, Crosby, Boa, Riehl, Gilbert and Young. It was interesting to note the rivalry between Gilbert and Crosby, and when the "smoke had cleared away," they had made a tie, 381 out of 400. Gilbert "fell down" in one event, when he lost 4, thus the tie. John Boa came third, with Young fourth. Burnside was high amateur, beating out Tom Hall by 1 target, viz., 361 to 360. Groves, the "booster" for the home club, was next, with 341. Scores:

Peters Lovin Cup.

Marshall, Tex., Sept. 12.—The second contest for the Peters loving cup was held here to-day and proved very interesting, as there was a tie on 24 out of 25 between Dr. Hall and Koeppe. In the shoot-off the Doctor held the best nerve and won out. There were several other doctors present, which shows that doctors appreciate recreation. Other scores were: Dr. Taylor 23, Bonner 22, W. A. Bell 21, Henderson 22, F. O'Leary 21, Mundere 19, Nelson 18, Hcyn 18, Barns 17, Rosenbrough 16, Davis 16, Carter 14, Dr. Hartsill 13, Jennings 12, Bill 11, Whaley 6, Scales 3, T. Whaley 3.

At Lexington.

Lexington, Ky., Sept. 14.—As sure as the week rolls around just so sure the members of the Ashland Gun Club get together and have rare sport with the bluerocks.

The Mountaineers.

Chattanooga, Tenn., Sept. 10.—The Mountaineers have a loving cup, donated by the Hunter Arms Co. For this trophy the club meet monthly and contest. At the end of the year the one who has made the highest score will become the owner. Each shoot calls for 50 targets—30 singles and 20 pairs—which gives a variety of shooting. The last shoot resulted as follows: Plummer 45, O'Connell 43, Webb 41, Roy 39, Morrison 38, Brown 38, Henderson 37, Stanley 36, Wilbrank 35, Ellis 30, Roberts 28.

Post Trophy.

Broken Bow, Neb.—In connection with the Clayton-Blevins match for the Denver Post trophy, held here Sept. 7 and 8, there was held a two days' tournament. Some very good scores were recorded, although there were but ten shooters present. Those present expressed themselves as well pleased with their entertainment.

Clayton is after all the Western trophies, and this being his third attempt to capture the trophy, it was a case of "have to." Standing at 19yds., Clayton made the very fine score of 92, while the distance no doubt handicapped Mr. Blevins, as his score of 82 will show.

Clayton will be called upon to defend the cup again, as it will be up during the tournament to be held here Sept. 29 and 30. This shoot will be the last one held before the game season opens and should have a large attendance. There was only one trade man present, A. H. Hardy, and he made good by winning high average with 162 out of 170. Old Dan Bray was second, 155. Waddington got in the second day, and was high, as he failed to "bust" but 3. Scores first day, 100 targets: Hardy 96, Bray 95, Scaney 91, Campbell 91, Blevins 93, F. Blevins 87, Kerr 85, Talbott 44, Clayton 92. Second day, at 70 targets: Clayton 62, Carter 61, Waddington 67, Bray 65, Campbell 66, Kerr 66, Hardy 66, Blevins 61, Mitter 63.

At El Paso.

El Paso, Tex., Sept. 10.—The El Paso Gun Club is alive to its interests, and the club events are well patronized, and when the tournament dates arrive, all will be in good shooting trim. Some very fine scores were made, viz:

Targets:	25	25	25	25	25	25	Total.
Rand	25	25	24	24	24	25	142
Shelton	19	21	19	23	21	19	122
Davis	13	9	6	11	39
Hill	23	17	23	21	23	..	107
Williams	24	21	20	16	81
Neff	14	11	16	14	55
Stewart	18	17	11	19	19	..	84
Tuttle	18	20	21	19	15	..	93

In Other Places.

The seventh meet of the Missouri League of Trapshooters, which will be held at Carthage, Mo., Oct. 10 and 11, will extend over two days; the first that of the League; the second the Carthage Gun Club, with \$100 added money.

The Berca, O., Gun Club held their shoot Sept. 13. Brown now leads for the badge. After this the seventh shoot. The fourth annual shoot of the Nappanee, Ind., Gun Club will be held Sept. 29. The management will do all possible to make the event interesting. Many programmes have been sent out, and a big attendance is expected.

The Utica, O., Gun Club was defeated on last Friday by a team from Licking, as with four men to the team, each 25 targets, the score was 92 to 78.

Notice has been served by five-man team of Men's Welfare Gun Club, of Dayton, O., that they will shoot any team of factory working men of the same city. For particulars address W. C. Breen, of the N. C. R. Co.

It appears that on Labor Day and prior most of the members of the Bridge City Gun Club held unusual practice, so that a slim attendance was the result on the last meeting day, Tuesday last. Theo. Sample, as on last occasion, proved to be the best shot.

The fourth shoot for the season by the Dixon, Ill., Gun Club was held Saturday. A few only were present, but some good scores were made. The next shoot will occur in two weeks.

Another gun club has sprung into existence. This time it is the Welfare, of the N. C. R. plant, at Dayton, O. Their opening shoot was held last Saturday, and the scores would indicate that they are not novices. A team shoot was held thus: five men, 50 targets. Breen's team won with 200 to 195.

The East Side Gun Club, of East Saginaw, Mich., will hold a merchandise tournament on Sept. 25. The prizes are estimated as being worth \$400. The shoot to conclude with a live-bird and a chicken event.

There will be several club contests held this fall by the Freeport, Ill., Gun Club. Waddington won first, A. C. Knorr second and Baldwin third.

There will be several club contests held this fall by the Marion, O., Gun Club, and the members will attend strictly to getting in best shape.

At the close of the Lafayette Gun Club tournament the badge was won by F. V. Nichols, of Medaryville, Ind. He had to shoot off the tie with Joe Blistain, each getting 46. Scores: Spencer 47, Riehl 44, Keck 37, Clark 40, Nichols 46, Brown 43, Thompson 40, Livenguth 43, Blistain 46. Spencer made the high average for the tournament, 373 out of 400. Riehl second, 361; Nichols made 347, Livenguth 343, Brown 340, Thompson 333.

The Wakarusa, Ind., shooters were treated to a good time when on Friday they journeyed to Ernest Beebe's place, northeast of town.

Mayfield, Minn., now sports a regularly organized gun club, and when the game shooting is slack will try out the bluerocks.

The semi-monthly shoot of the Janesville, Wis., Gun Club was held Saturday at the Athletic Park. As there are now twenty-five members in good standing, the attendance was large. The next shoot will be held the coming Friday, at which time the Emerald Grove, Milton and other nearby towns are expected to furnish shooters who will help swell the throng, and a 50 target event will be the added attraction.

A gun club has been started at Hobart, Ind., and should succeed, as there are now twenty-four names enrolled.

Announcement is made that the Recreation Gun Club, of Cleveland, O., will hold regular practice meets at least until after the tournament, to be held Sept. 28.

On Sept. 12 the Kansas City shooters gave a dinner in honor of Wm. Clayton, who so easily defeated Oscar Blevins, the Western target shot, in their match at Broken Bow, Neb., for the Denver Post trophy.

On Sept. 25 there will be a match between the live-bird teams of Kansas and Missouri, to be held at Elliott's Blue River Shooting Park, same being for the Elliott trophy and a side bet of \$100. The Missouri team will be W. M. Clayton, Harry Tipton, Doc Leavel, Paul Franke and Dr. Plancke. Kansas will have the best team, the one that has formerly won together, viz: Ed. O'Brien, Ed. Arnold, Henry Andersen, J. J. Gorman, and G. W. Paxton.

The Quincy, Ill., shooters are still at practice, though their tournament was held last week. It is certain that their order will cease when the Southern duck flight begins to arrive. It was Griffin that led the pace and captured both the medal and the trophy on two straight scores of 20.

You would not suppose that there could be found in Jacksonville, Ill., fifty-four men who could shoot a clay target; yet, such was the case, as on Labor Day two teams of twenty-five each shot a match. The one captained by Pratt made 455 to Capt. Benson's team's 451. While some on either side broke but 3 out of 25, others averaged from 16 to 24.

Reports from Boston, Ind., show that at the annual gun club meet Arthur Nelson won the medal, which is emblematic of the championship. He scored 95 out of 100.

Chas. Vermilya, of Columbiaville, won the highest honors at the eighth annual shoot held last week at Vassar, Mich. Ralph Trimble, Fred Foster and John Cox were present at the Greenfield tournament, held last week, and made things lively. Wm. Rennick, of Detroit, won the high amateur score, for which a special prize was given by the club.

Bloomington, Ill., Sept. 14.—The interest shown by members of the McLean County Gun Club is very gratifying to the officers. The gold medal event brought out a new winner in Mr. Ridge.

Garfield Gun Club.

Chicago, Sept. 17.—The appended scores were made on our grounds

to-day on the occasion of the seventh and last trophy shoot of the third series. Bullard won Class A trophy on 22; W. Einfeldt Class B on 21, and Dr. Skillman Class C on 15.

In the cup shoot, which followed, Bullard won again in Class A, W. Einfeldt again in Class B, and Birkland, Jr., in Class C. The day was a very unfavorable one for target shooting, as a small hurricane blew directly across the traps, making good scores almost impossible.

The entire club will be re-classified before next shoot.

Trophy contest, 25 targets:

Thomas	1111111100011110111011111—19

Cincinnati Gun Club.

CINCINNATI.—Sept. 17 was an ideal day for trapshooting, and there was a good attendance, twenty members shooting in the Parker prize gun event. There is but one more contest in this series, which will be shot on Oct. 1, and then will come the shoot-off of the ties, in which probably a dozen or more will participate.

In the shoot to-day Randall was high man with 95 actual breaks, and made a run of 60 straight. Gambell shot more like himself, and finished second with 90.

The boys will not go to Dayton on the 21st, as planned. The match has been postponed until Sept. 28.

Ackley returned from his summer's outing at Sau't Ste. Marie, on the 15th. He shows much improvement in health, and reports having had some fine fishing.

Williams, who spent his vacation in the Pine Tree State had some fine duck shooting on the Cape. He attended the State shoot held at Portland, and spoke of the excellent work done by the Portland Gun Club's team in the race for the five-man team championship.

Gen. Shattuc was out and visited with the boys awhile.

Parker prize gun, 100 targets, handicap of added targets:

Hdep. Brk. Tot'l.			Hdep. Brk. Tot'l.				
Randall	15	95	100	Knight	35	65	100

Col. Thomas W. Paxton.

The funeral of the late Col. Thos. W. Paxton was held at Elk's Temple on Sept. 16. Col. Paxton was a member of the Cincinnati Gun Club, and was one of the founders of the famous Pelee Fishing Club. He was an enthusiastic sportsman and will be greatly missed by the devotees of the gun and rod. He was a man of fine physique, quiet dignity of carriage, of mild speech, always willing to do for others, with entire forgetfulness of self, which endeared him to all who knew him.

N. S.

The Tipton Gun Club, of Tipton, Mo., held its regular medal shoot on Sept. 15. The medal was won by King, with 20 out of 25. In the other events shot, Hawver broke 46 out of 53. Hotel 25 out of 30, and Swallow 19 out of 32. Mr. Samuel Hawver made a new club record. At 35 targets, 5 being thrown on one call, "Pull," he broke 30, using a Winchester gun. He broke the first 11 straight. It was the best exhibition of marksmanship which has been seen on the grounds in the past two years.

At the regular shoot of the Here He Goes Gun Club, on Sept. 11, the sport consisted of team races.

The N. C. R. R. Gun Club, of Dayton, has one new grounds. On Sept. 10 the entire outfit was dedicated, a good crowd of shooters and spectators being present.

In the handicap medal shoot of the Dayton Gun Club on Sept.

ACCORDING TO THE RULE OF OBY.

NOW THIS was the weather rule of old Old Oby, who was the father of Oby's son Obadiah, who was the father of 'Diah, who was the father of Oby, who was the father of Old Oby's son 'Diah, who was the father of Lwin' Oby, whom nobody ever believed, and who was the last of this particular race of Obadiahs. This was the rule of Old Oby the weather prophet: Kill a black duck, or a broadbill, or a coot, or a sheldrake, in August; pluck it, and take note of the feathers. If it shall have pin-feathers on the breast, there will be an open fall and winter. If, instead of the pin-feathers, there shall be found the breast covering of thick, fur-like down of the winter jacket, this will mean an early fall and a hard winter.

As a foreteller of weather to come, Old Oby had great repute in his day and in his own country on the south side of Long Island. There are many duck shooters who consult the sign of the wild duck's breast, and implicitly believe in it. Mr. Miles Wood, of Brooklyn, who has followed the ducks of Long Island and North Carolina and Virginia for seventy years, more or less, reports that he has often tested Old Oby's rule, and the results have been such as to give him faith in it. In the middle of October, 1902, he found the broadbills, black ducks, and sheldrakes still in the pin-feather stage of plumage, indicating an open winter; and, as everyone knows, the winter of 1902-3 was a mild one. In the autumn of 1903, ducks killed in the early part of the season were found to be covered with down and to be without pin-feathers; this meant cold weather, and the winter of 1903-4 was a hard one. This season the ducks have moved south very early; a Currituck correspondent reports that they have already reached those waters in great numbers. A broadbill, a sheldrake, and a black duck, killed on Long Island on September 17, were found to be without pin-feathers, to have their full coat of thick brown down on the breast, and to be as fat as they usually are in November. By weather prophets who prognosticate according to the rule of Old Oby, this is taken to signify that the winter of 1904-5 will be one in which the duck shooter will do well to use No. 2's and 3's instead of 4's and 5's when he goes after his game, and to lay in an extra ton or two of coal for his home.

A PHASE OF FIELD TRIALS.

It is commonly accepted that the field trials of the Tennessee State Sportsmen's Association, held in 1874, were the first held in the United States. Since that pioneer event, a multiplicity of field trials have been held in every section of the United States and in Canada.

Since the first trial, the intervening years have been happily distinguished by a beneficent and progressive advancement in the arts and sciences. The traditions and beliefs pertaining to the professions of law, medicine and divinity have undergone great and improving changes. The political, social and mechanical worlds have not escaped the transforming hand of progress. In innumerable instances, old ways and means, once excellent, have become obsolete, having been superseded by the newer and better order of things.

Yet in all these radical mutations of time and progress in worldly affairs, field trial interests seem to have possessed a charming immunity from change. It is as if they were perfection from the outset. In sentiment and associations, they seem to be alike everywhere. Their traditions, beliefs, procedure and affectations of good fellowship and brotherly sportsmanship have been maintained inviolate from time immemorial. They are as immutable as light and love.

Let us compare the remote field trial days with the near, which is the equivalent of comparing the near with the remote, or with any other.

At all times there were five dominant factors, namely, the club members and owners of dogs in competition; the dog handlers, the judges, the sporting press and the dogs. Each one had a distinctly special field, and each one thought himself, or itself, the most dignified, important and indispensable.

In the remote days the field trial procedure, in a general way, was much as follows: Some weeks or days before the trials were held, sundry altruistic letters from amiable sportsmen appeared in the sportsmen's press descanting ornately on the incomparable benefits which accrued to

sportsmanship from practical field trial participation. In many instances the philanthropic writers were owners of dogs which they hoped in good time to graduate into the public stud, but that benevolent purpose did not necessarily hoodwink them to the nice amenities of sportsmanship. It was held that the trials at large promoted valuable acquaintance, good fellowship, good friendship, and higher standards of sportsmanship. Indeed, those sentiments were among the first solemnly set forth in the constitution of every field trial club. From a socialistic viewpoint they were perfect sentiments.

The next conspicuous stage was the selection of judges, and the publication of their names in the sporting press. Year by year they were eulogized in due stereotyped form. It was called to mind that they were men of vast experience, iron will, and judicial impartiality; popular among their fellows, and without doubt men who would give the contestants perfect satisfaction.

The next step in order was a poem in prose in respect to the fitness of the grounds, the abundance of birds, and the good will of the local residents. When the concocter of the poem in prose wrote those things, a nimble fancy was oftentimes more essential than the facts.

After the trials were run, the truly active, acute and interesting stage had arrived. The press, with every upward and downward stroke, flayed the judges. Their mistakes, great and small, real or imaginary, were set forth with an earnestness which would do credit to the fate of nations. The able judiciaries before the trials were too debased for a dunce's halo after the trials. Stupidity, partiality, inefficiency and unworthiness were then their chief traits. They were hardly fit to associate with such upright and honest men as the handlers. The handlers won the lime-light in the next stage of the field trial consequents. Each one had a dog which was well bred, well owned, and incomparable as a worker. The judges, therefore, were wrong, and the reporters were wrong in their criticism of the judges, in so far as their dogs were ignored or mentioned unfairly.

And thus year by year is acquaintance and good fellowship promoted by field trials, and the standards of good sportsmanship elevated to greater heights for all good sportsmen to emulate, but not to surpass.

SOME WILDWOOD POISONS.

ALTHOUGH it is a well understood fact that there are many poisonous plants growing in all parts of the country, comparatively little is known about them. Most people in the East have experienced, or seen in others, the dreadful effects of the poison ivy; while on the other hand, in the West, plants acting in another way—as the larkspur, or poison weed; the loco, or crazy weed—are very well known, and the damage done by them is exceedingly serious. So great is the harm done by loco in some portions of the West, that between 1881 and 1885 the State of Colorado paid out no less than \$200,000 in bounties in the hope of exterminating the plant. It is hardly necessary to say that these efforts were ineffectual.

Over much of the Middle States and of southern New England the poison ivy grows in enormous abundance; fences, stone walls, hedgerows and tall trees are covered by it, with beautiful effect to the eye, but with dire results to the person going too near the plant, provided he or she is sensitive to the poison. On the other hand domestic animals—and no doubt wild ones as well—appear to be unaffected by the poison. Cows, horses, mules and goats eat the leaves readily, and apparently without ill-effect. They push their way through thickets of the vine, and seem never to suffer from it.

The human subject is variously susceptible to the ivy poison. Some individuals can handle the plant without danger; others cannot go near it without great subsequent distress. Some people will be very badly poisoned by passing to the leeward of a fire in which the stems of the ivy are burning.

There is a great variety of plants which poison animals and people who eat them, but most of them are not especially attractive, and are eaten chiefly in curiosity and ignorance by little children. Deaths from eating jimson weed occur very frequently in and near large cities, and it is but a few weeks since several cases of the kind were reported in a suburb of New York.

There are two mushroom-like toadstools or fungus

which are violently poisonous. These belong to the genus *Amanita*, and are called fly-killer, fly fungus, and poison fungus. The first one is perhaps the best known of all the poisonous fungi, and has been used in Europe as a fly poison for hundreds of years. While bearing a close resemblance to the common mushroom, it may be distinguished from it by having white instead of purple gills, by its warty cap, its bulbous stem, and by the fact that it grows in forests where the edible mushroom does not grow. The so-called death-cup or bulbous *Amanita*, is even more poisonous than the fly-killer, and should always be avoided, for cases have been known where handling it has caused trouble. This species also has white gills and grows in woods, though sometimes getting out on to the lawns. Both these fungi have a collar about the stem just below the head.

False hellebore, known also as Indian poke, pupper root, earth gall, crow poison, devil's bite, wolfsbane and bugbane, is also poisonous if eaten. It is a stout perennial plant from two to seven feet high, bearing large plaited, stemless leaves, and a terminal cluster of greenish or yellowish flowers, blooming in May to July. Human beings have been poisoned by eating the roots, and horses by eating the leaves; but certain ruminating animals, as sheep and elk, appear not to suffer inconvenience from eating it.

The pokeweed is well known to every American country boy, and most of them have made red ink from its berries, which are also greedily eaten in autumn by many birds. The young shoots of this plant are commonly eaten as greens, but these should be well boiled, and the water should be changed once before the stems are eaten. Poisoning has occurred from eating the root and the fruit; but, on the other hand, as has already been said, the birds eat the berries with impunity.

Several species of larkspur are regarded by stock growers as destructive to cattle. They are among the first plants to show their green leaves above the soil in spring, and are therefore eagerly sought for by cattle, often with fatal results. It is quite possible that animals accustom themselves to this plant, and that if eaten in small quantities in conjunction with other plants, the percentage of deaths resulting is very small.

The leaves of the wild cherry are said to be fatal to cattle, which soon after eating are afflicted with labored breathing, convulsions and death. In all such cases there is an evident odor of prussic acid in the breath.

The damage caused by loco is well known. Horses, cattle, and sheep are affected by it, but horses most of all. An animal which has eaten loco is for a time crazy (*loco* Sp.). It seems not to be able to see, and cannot altogether control its movements. Apparently starting to go in one direction, it will suddenly turn off to one side, and perhaps run into a fence or building. After it has acquired a taste for the plant, it continues to eat it, searching for it everywhere, and after a few months or years dies.

Allied to the loco is what is known as rattlebox, rattleweed or wild pea, a familiar plant from the Atlantic Coast to the Missouri River, and even beyond in New Mexico. It acts somewhat as loco does, but is much less violent.

Two species of euphorbia are poisonous to eat or to handle. The bitter, milky juice when it touches the skin causes redness, itching, and often a breaking out of pimples and blisters, while if by any chance the seeds are taken internally in any quantity, death may ensue. In certain sections where the bees resort largely to the blossoms of the euphorbia, the honey is made unsalable, being disagreeable to the taste and mildly poisonous.

Poison ivy, poison oak, and poison sumach, are found over most of the country, and are perhaps the best known and most distressing of the poisonous plants of America. Investigations recently made show that the poison is a non-volatile oil, found in all parts of the plant. Like all oils, it is insoluble in water, and therefore cannot be washed off the skin with water alone. Alcohol, however, readily removes it, and its effect is destroyed by an alcoholic solution of sugar of lead. Mr. V. K. Chestnut, author of an interesting pamphlet on poisonous plants of the United States, published by the Agricultural Department, has this to say about the effect of the oil on the skin:

"Numerous experiments show conclusively that the oil

produced precisely the same effect as does the plant itself. When a very minute amount is placed upon the skin, it is gradually absorbed in the course of a day or so, and within certain limits the effect is proportional to the time of contact. In an experiment performed by the writer, the oil was applied to four places on the left wrist, and these were carefully guarded to prevent spreading. At the end of an hour one of the spots was thoroughly washed by successive applications of alcohol. In three hours the oil from a second was washed off in the same manner, and the others were cleansed three hours later. There was little or no effect on the first; that on the second was more marked, but did not equal that produced on the last two, which was about the same in each. The spots were within an inch of each other, but remained wholly distinct, a fact which very clearly shows that the affection is not spread by the blood. Subsequent applications of an alcoholic solution of sugar of lead gave speedy and permanent relief."

The best remedy is a saturated solution of 50 or 75 per cent. proof alcohol with powdered sugar of lead. The most effective means of getting rid of the poison ivy is by uprooting the plants. This, of course, can only be practiced by persons not susceptible to the poison. The poison sumach, also called poison dogwood, poison elder, and poison ash, is a tree rather than a vine. It is not less dangerous than the more common poison ivy.

Certain buckeyes—especially the red buckeye—are more or less poisonous; cattle sometimes are killed by eating the fruit of the red buckeye. The allied horse chestnut and Ohio buckeye are poisonous to some extent, while on the other hand some of the California Indians use the fruit of the California buckeye for food, after removing the poison by roasting and leaching.

Two species of water hemlock—one found from the Atlantic to the Rocky Mountains, and the other in the central region and toward the Pacific Coast—are violent poisons. They are sometimes eaten by cattle and sometimes by children, as they have a pleasant taste and an aromatic odor. The root and root stock are most violent poisons.

The poison hemlock is an old world plant which has become naturalized in the United States. This is believed to be the poison that Socrates drank, and so is historically very old.

The black nightshade, known also as common nightshade, is an introduced weed which is generally distributed in suitable locations. Cattle occasionally are killed by eating the plant, but comparatively few cases are fatal.

A Collection of Antique Arms.

A SPORTSMAN of this city, who has been a subscriber to *FOREST AND STREAM* from its very beginning (and his subscription is now prepaid for more than a year), has a small collection of pistols and guns, notable rather for their mechanical peculiarities than for artistic or rich ornament. We have recently looked them over, and now present in an illustrated supplement page some pictures from photographs of a few that seem to us particularly worthy of note.

No. 1 is a Japanese match lock pistol. The barrel is of iron, octagonal in shape, possibly cast iron, very thick, bore 0.40 inch, 1 inch outside at muzzle, 1.25 at breech, and 12½ inches long; total length of the pistol is 23 inches. The barrel is inlaid throughout its length with a tracery of very fine silver winding about like a vine, and the wooden stock is very finely finished and polished. The pan is a projection of the same metal as the barrel, and has a swinging brass cover, which is shown open in the photograph. The lock plate, springs, hammer and trigger are all of smooth brass. The hammer is shown at full cock in the photograph. In the end of it is a small piece of slow match or punk. The small knob, near the grip, is the trigger, and when it is pressed, the hammer, actuated by the brass spring on the outside of the lock plate, carries the slow match to the powder in the pan and ignites it, and the piece is discharged. There is no date upon it. Match locks are still used by some of the Chinese and Tibetans.

No. 2 is a wheel lock pistol. The barrel is 18 inches long, and has a caliber of 0.45 inch or gauge 50. The entire length of the piece is 26 inches. The pan is attached to the lock plate; underneath it, and with its edge rising into the pan, is a wheel. This wheel is wound up by a key or crank, which is shown in place on the photograph, and which is removed as soon as the wheel is wound up. The hammer, or cock, carrying a piece of flint or of iron pyrites and acting under the force of a strong spring, presses the flint or pyrites against the edge of the wheel. When the trigger is pulled, a strong spring inside the lock plate causes the wheel to revolve with great force and velocity, striking a shower of sparks from the pyrites into the powder in the pan, and the piece is discharged. Wheel locks are said to have been invented in Nuremberg in the year 1515, to supply the demand for poachers at night, because the carrying of lighted slow match for match locks disclosed

their whereabouts to game keepers and guards. Wheel locks are frequently shown in illustrations of early Colonial and Canadian history.

No. 3 is a horse pistol, very strongly built to stand rough usage. The barrel is 10½ inches long, with a bore of 0.66 of an inch or 16 gauge. Length from butt to muzzle, 16 inches. It has an iron ramrod hung on a swivel to prevent its loss. It was used by cavalry.

No. 4 is one of a pair of very finely finished duelling pistols made by Tatham & Egg, of London. Its bore is 0.63 or gauge 19. The barrel is 9 inches long, and from butt to muzzle it is 14 inches.

No. 5 is a pistol which bears the Liege proof marks, though it was bought in Syria some years ago. The barrel is 7 inches long, and has bore of 0.68 of an inch, or 15 gauge. Length from butt to trigger, 6 inches, and from butt to muzzle, 15 inches.

No. 6 is a very old Spanish pistol, of large bore. The works of the lock are all on the outside of the lock plate, and it has a belt hook to carry it upon belt or sash without a holster. The barrel is 4¾ inches long, bore 0.73 of an inch or 12 gauge, and length over all, butt to muzzle, 10 inches.

No. 7 is a double-barreled flintlock pocket pistol made by Barbar, of London. It has but one hammer and one cock, or pan cover. There are two depressions in the pan to hold the priming powder, one for each barrel, one of which, for the left barrel, can be covered by a slide moved by a knob or projection, to be seen in the photograph. All the iron work, except the barrels, is deeply engraved in relief. The barrels, including chambers, are 5 inches long, with bore of 0.45 of an inch. Butt to muzzle, 10½ inches.

No. 8 is a pocket pistol made by Rainkin of Paris. The barrels are placed "over and under" instead of side by side, as in No. 7. There is but one hammer and pan cover. The bottom of the pan is a cylinder which can be revolved by the handle fastened by a screw, which can be seen in the photograph. This cylinder has a small segment cut out of it, which carries the priming powder for the left barrel. When the cylinder is so turned as to keep the priming powder in its segment away from the sparks of the flint, the right barrel is fired by the ignition of the priming powder in the pan above its cylinder bottom, then by closing the pan, cocking, and turning the cylinder so as to expose the priming powder in its segment to the sparks from the flint, the second barrel is fired. The barrels are 3½ inches long, bore 0.40 of an inch, and total length 8 inches.

No. 9 is a handsome and graceful officer's pistol, such as are frequently seen worn in belts and sashes in portraits of officers of our navy in the time of the Revolution and the War of 1812. The barrel, including chamber, is 5 inches long, with bore of 0.58 inch, or gauge 23, and the total length from the butt to muzzle is 10½ inches. The stock is inlaid with fine silver work, the butt plate is a grotesque masque in silver.

Nos. 7, 8, and 9 are all breechloaders; that is, the barrels are unscrewed and taken off the breeches in order to load. The chambers in the breeches are then filled with powder, and the bullet, which is very slightly larger than the bore of the barrel, placed upon it, the barrel is then screwed on again. When fired, the bullet is compressed and passes through the barrel without any windage.

No. 10 is a dainty little French pocket pistol, only 7 inches long over all. The barrel is 3 inches long, with a bore of 0.23 of an inch. The trigger guard and other mountings are of silver, and the top of the barrel is inlaid with gold, and the stock with silver filagree.

No. 11 is a brass pocket pistol with a bayonet. The bayonet folds under the barrel, the point of it catching in the trigger guard, which is movable. When the trigger guard is pressed the point is released and a spring causes the bayonet to fly into the position shown in the photograph, where it is "fixed" by a catch. It is bell-muzzled horizontally, but not vertically, the horizontal diameter at the muzzle being 1.10 inches and the vertical 0.70 inch. Its length from butt to muzzle is 8½ inches, and from butt to point of bayonet, when fixed, 11½ inches. It has the Liege proof marks.

No. 12 is a blunderbuss. The barrel is of brass, 14 inches long, having a bore of 0.77 inch, 10 gauge, except at the muzzle, when in a length of six inches it is enlarged to 1.1 inches, making a "bell-muzzle." The whole length of the piece is 26 inches. About a hundred years ago blunderbusses were much used for house protection, as revolvers are nowadays, and hung over the fireplace in the kitchen of farmhouses. They are often seen in illustrations of English life; for instance, when a country gentleman is going in a carriage with his wife and daughter to visit a neighbor, his carriage is guarded by some half dozen servants on horseback, armed with blunderbusses. The load was a handful, more or less, of buckshot or slugs. This piece was made by Brander & Potts in 1804, and bears the Tower proof marks.

No. 13 is the first breechloading musket used by the United States Army. It was made at the Harper's Ferry Arsenal under Hall's patent in 1838. This one has a

flintlock, though both muskets and carbines were afterward made, under Hall's patent, with percussion caps. The breech block is shown raised and ready for loading, in the photograph. The breech block was simply pushed down into place and line with the bore to make it ready for firing. It is a smoothbore, 28 gauge, or 0.55 inch caliber. The ramrod was only used as a cleaning rod.

No. 14 is a muzzleloading "saw-handled" percussion cap pistol, with hammer and nipple underneath the barrel, which made it practicable to have the rear sight and front sight far apart. Its bore is 0.18 of an inch, and the rear and fore sights are 6½ inches apart.

No. 15 is an eight-barreled "pepper box," percussion cap, self-cocking revolver, having the Liege proof marks. The hammer is entirely concealed; differing in that respect from the six-shooter "pepper-box" of the California forty-niner, which was made in Worcester, Massachusetts. The barrels are of fine pattern Damascus, with bore of 0.19 of an inch.

No. 16 is a pocket knife having a pistol barrel on the back of the handle with a nipple or tube for a percussion cap projecting from the breech or rear end of the barrel. It is shown at full cock in the photograph. The trigger folds up into the knife handle for carrying in the pocket. In the butt is a small magazine for carrying spare ammunition. The cover of this magazine is shown open in the photograph. Close to it, on the side, is a small bullet mold, with the handle pushed into a receptacle, by means of which a bullet can be made to fit the barrel, the bore of which is 0.30 inch. It is 6½ inches long from butt to muzzle, and the larger knife blade is 3½ inches long. It bears the Birmingham proof marks, and was made by Unwin & Rodgers, Sheffield.

No. 17 is the "Le Mat" patent, percussion cap, revolver. The cylinder has nine chambers of 0.41 inch bore. The axle upon which the cylinder turns is hollow, and forms a barrel of 0.64 inch bore, 18 gauge, for a large ball, or a load of buckshot. The head of the hammer is movable, and can be adjusted to strike the caps firing the chambers or the barrel in the axle. In the photograph it is adjusted to strike and fire the large barrel. The smaller barrel is 7 inches long, and the pistol is 14½ inches long from butt to muzzle, and weighs 3½ pounds. It is said that in our Civil War, Forrest's Confederate cavalry was armed with these revolvers. A pocket pistol on this principle, using eight 0.22 caliber rim-fire cartridges in the cylinder, and one 0.32 in the axle, was patented in this country in 1880 and manufactured in Connecticut.

No. 18 is a double-barreled pocket pistol on the Lefauchaux principle, using the pin-fire cartridge. It has two hammers with secret triggers, for carrying in the pocket. The barrels are 2½ inches long, and from butt to muzzle it is 6 inches long, caliber 7mm. It illustrates fully the principles of Lefauchaux, whose invention, in 1836, of the pin-fire cartridge in copper, brass, and paper, and dropping down the barrels of guns from the breech made breechloaders practicable for modern sportsmen.

No. 19 is a pin-fire Lefauchaux revolver, 0.45 caliber, 6 shots, 6 inches length of barrel. It was carried by a distinguished officer of the Sanitary Commission during our Civil War.

No. 20 is a percussion cap breechloader, with steel barrel, bronze lock and action cover, and wooden stock or grip. The breech block is drawn back from the base of the barrel to allow insertion of combustible envelope cartridge by a lever, which folds back against the stock. The lever is shown in the photograph half way between the stock and trigger guard, and the breech block is partly withdrawn from the barrel. The barrel is 6 inches long, total length 11 inches, bore 0.23 inch; patented in United States in 1850 and made in New York.

There is also in the collection a case of percussion lock duelling pistols, with all their furniture of flasks, loading and cleaning rods, bullet molds, etc., all in complete order. It was made by John Blanch, who was brought up in his trade by Joe Manton, and is mentioned in Col. Peter Hawker's "Instructions to Young Sportsmen," published in 1820, as one of the reliable London gun makers. Blanch was gun maker to His Royal Highness the Prince Regent, which approximately fixes the date of the pistols as between 1811 and 1820.

Besides these, there are in the collection a very fine pair of Derringer pistols, gold and silver-mounted; a finely finished pair of double-barreled flintlock carriage pistols; some Turkish flintlock pistols, which seem to have been made rather for ornament than for use; several very small Damascus barrel, ivory-stocked, vest-pocket pistols; a double-barreled flintlock shotgun, 30-inch barrels, 20 gauge, 6½ pounds' weight, made by D. Egg, of London; a three-barreled, 32 caliber, rim-fire cartridge, pocket pistol, with a broad knife-blade, which projects from the muzzles like a bayonet; Colt's revolvers, National revolvers, with special cartridges; a pair of brass-barreled flintlock pistols, with brass lock plates and furniture; an Allen patent breechloading shotgun, the breech opening being like the Snyder musket; Spencer repeating carbine, Maynard, Burnside, Merrill, and Sharp carbines.

A COLLECTION OF ANTIQUES.

"ALL SHE CAN SWING TO."

THE SPORTSMAN TOURIST

Wig-Wagging the Last Antelope.

As COMMONLY regarded, the Great American Desert is not a sportsman's paradise; but, considered from the point of view of those who prefer quality to quantity, it contains a numerous population of birds and animals once common to a much wider range, but now driven to seek safety in the heart of a section that less often feels the foot of man. It was my good fortune to spend some four months in and around Death Valley about a year ago, and Bob, my half-breed Piute guide, brought this last statement home to my mind in a most vivid manner when he led me one afternoon to a sheltered nook in the Panamint Mountains, whence we had an undisturbed view of a band of about fifty bighorns feeding in perfect security at a distance of less than one hundred yards. This Indian knew the country perfectly, and often spoke to me of his band of "deer," by which, of course, I supposed he meant some herd of white-tailed deer that he had found living a comparatively restricted life in any one of the little valleys with which these mountains are scarred. Like most of the breeds of the region, however, he was not given to overmuch talking; but some months later, when we had pitched a temporary camp up near the northwestern end of Death Valley, he came to me and begged me to go and see "his deer." So the next morning, in that noiseless hour that comes just ere the sun lifts itself over the eastern rim of the world, I followed him away out over the level floor of the desert toward a blue-gray line of buttes which, so he told me, marked the rise of a river. Those who know the desert know, perforce, the desert river, shallow, slow-flowing stream that it is, rising from some fissure spring in the low hills, twisting itself through ten or fifteen miles of sloping plain, and finally losing the last silver thread in the insatiable sands. For a space it enlivens its world and makes possible the maintenance of the scant grasses and the few flowers that invariably fringe its brim. To it, too, come the wild things of its world, not alone, to drink its waters, but to feed themselves with that which its waters bring from the soil. Following them in the everlasting order of the hunter people the world over come such primal men as manage to eke out an existence in this barren land; but for some reason, probably because it was in a way somewhat off the beaten trails of this part of the desert, no camp of Piutes had been pitched upon the banks of the stream to which my companion was leading me. This much I gathered in the rare intervals of his loquacity; the rest I learned by keeping my eyes open as we rode along.

From early dawn until noon we passed slowly over as level a bit of country as can be found anywhere in the world, the well-trained ponies keeping up that rolling lope for which animals of their kind are noted and which puts behind them miles of which the rider scarce may take account until he has reached his destination. The sun at the zenith found us fully forty miles from camp, and well within the shadow of a range of lava buttes which extended some five miles on either side of the clump of mesquite trees whereunder we paused to rest our horses and eat the lunch brought from the well-stocked larder of the camp cook. Then the way led on up through a defile in the lowest part of the range—a narrow gorge through which, in all probability, no white man had ever passed before, and on down to a little spring which flowed fitfully from a crevice in a lava-covered wall of conglomerate, wrought by the fires of long ago into a hard-nosed nothing short of the patient cutting of the water could ever overcome. Below the spring other tiny streams, born of like sources, joined the main brook, until, where it broke away from the hills, it was a stream of some twenty feet in width and a foot or two in depth. Lush grasses studded with wild flowers innumerable and a thin line of scrubby mesquite shrubs bordered the watercourse for a few yards on either side, but of animal life there was very little visible save a few long-eared jack-rabbits that slept away the heated hours in fancied security in the shade of the leafiest of the mesquites. For perhaps ten miles we followed the river bed, startling hares from their forms and stopping only to kill two of the dreaded "sidewinders," as the little yellow rattlesnakes of the desert are called, until the stream began to dwindle appreciably in volume and the verdure along its banks became a mere straggling line of green. Then suddenly, as if by some strange magic of nature, the narrow coulee into which the river had sunk spread out into a miniature lake—a mere pond of some hundred feet in length and width and scant depth of not more than a couple of feet. Here the stream ended, and, motioning for silence, the Piute dismounted, tied his horse to one of the many convenient mesquites, and started on foot around the western edge of the pool. Following his example, I soon joined him, and a few steps in the yielding sands brought us to a ridge of sand hills, thrown up by the last receding waves of the mighty sea that once covered this desert, and which now blocked the further progress of the watercourse down which we had come. Along the base of the sand hills, headed ever toward the sun, now getting well down in the west, our course led. At last the half-breed seemed to know by some fine form of intuition that we were opposite the thing we sought, and, dropping flat on his face, he crawled to the top of the ridge, motioning me to follow. I did so, peering through the screen of greasewood bushes at the top of the sandhills at the little valley spread out below.

Beginning at the very base of the sandhills, and evi-

dently an underground outlet for the small lake we had just left, a narrow thread of green showed where water was flowing. Here and there groups of stunted mesquites offered shade, and all in all the sight was one refreshing to the eye long accustomed to the dead sameness of a desert landscape. But none of these things drew my attention as did the seven animals that fed unsuspectingly along the brook. "My deer!" whispered the savage at my elbow, yet he showed no desire to kill, and I am sure my only wish was for the old pony Premo now boxed up at camp more than sixty miles away. These were his deer; and yet they were not deer, they were pronghorns, the last band known to California—very possibly the last to be left alive of all the few depleted herds that yet remain in the New World, for it will, to my thinking, be many a day before the hunters of the outside world draw bead on these treasures of this primitive Ishmaelite. Long we lay there and watched them play and eat and rest, and then rouse themselves to graze again amid the grasses. Then we tied an old red handkerchief to the end of a slender greasewood stick and with this improvised flag caught the attention of the watchful old leader, who, at first sight of the new object on his field of vision, raised his head with a snort we easily heard and dashed off down the valley, followed by his whole band, seven in all, two bucks and five does, as nearly as we could make out without glasses, though one of the supposed does might have been a yearling buck. After a while, seeing that the flag continued to wave, the whole herd came back, slowly and with mincing steps, yet plainly overcome by their curiosity. So we drew them, patiently and so carefully lest we make the least sound, that they came up within less than a stone's throw of our hiding place, and there, when we took the flag down, fell to grazing on the young shoots of the shrubs. And so we left them, none the worse for our coming; ourselves—one of us, at least—much the wiser if not the better for having seen this bit of a life that is fast passing away forever.

That night we camped on the banks of the little lake, killing one of the many rabbits of the region for our supper, and sleeping through the white desert night as only they can sleep who live the life of the wild. Next day the willing ponies turned their noses toward camp, carrying us in in somewhat less time than we required to cover the ground the first day. But in all that silent, sixty-mile ride homeward, and in all the days that I knew him and hunted with him afterward, the taciturn half-breed never said ought of why he held this little band so sacred, or when and how he had discovered them.

HARRY H. DUNN.

Trails of the Pathfinders.—XVIII.

Alexander Henry (The Younger).

(Concluded from page 216.)

ON July 28 they started on their return to the north, in constant fears and alarms lest the Assinaboines should steal their horses. A few days later the horses, troubled by mosquitoes, broke their ropes, and eight of them ran off in their hobbles. These could not be found again, and some of the people were obliged to go forward on foot, while the baggage was loaded on the remaining horses.

On his journey back to the Pembina River, Henry had an experience comical to read about, but not to endure. "We took the traverse for the mountain, but on coming to Cypress River found it had overflowed its banks about three acres on each side, and could find no fordable place. We were obliged to turn out of our way some miles, in going to where we perceived a large, dry poplar tree, and a few stunted willows, but there we had the mortification to find that the wood stood on the opposite side of the river. There being no alternative, we unloaded our horses and stripped. I crossed over, collected what brush I could find, and with the poplar formed a raft, so very slight as to carry scarcely more than fifty pounds' weight. The mosquitoes were intolerable, and as we were obliged to remain naked for about four hours, we suffered more than I can describe. The grass on each side was too high to haul our raft through to dry land; we could use it only on the river by means of two long cords, one fastened to each end. Ducharme hauled it over to his side, and after making it fast, he went to dry land for a load in water up to his armpits, whilst I waited with my whole body immersed until he brought down a load and laid it upon the raft. I then hauled it over and carried the load to dry land upon my head. Every time I landed the mosquitoes plagued me insufferably; and still worse, the horse that I had crossed over upon was so tormented that he broke his fetters and ran away. I was under the cruel necessity of pursuing him on the plains entirely naked; fortunately I caught him and brought him back. I suffered a good deal from the sharp-pointed grass pricking my bare feet, and mosquito bites covered my body. The sun was set before we finished our transportation. The water in this river is always excessively cold, and by the time we got all over, our bodies were as blue as indigo; we were shivering like aspen leaves, and our legs were cut and chafed by the coarse, stiff grass. We shot an old swan, and caught two young ones that could not fly; this made us a comfortable supper."

Henry reached the fort August 14.

"One of our hunters killed thirty-six prime bears in

the course of the season on the Hair Hills. Whatever number of bears an Indian may kill in the summer or fall is considered of no consequence, as they are valueless and easy to hunt," Henry records; "but after they have taken up their winter quarters the Indians glory in killing them."

In August, 1808, Henry finally left the Panbian River, on his way westward, bidding adieu also to the Saulteur tribes, among which, as he says, he had passed sixteen long winters. His journey was through Lake Winnipeg to the Saskatchewan and Lake Bourbon, now known as Cedar Lake. On the 22d he passed old Fort Bourbon, established in 1749 by Verendrye, and entered one of the channels of the Saskatchewan. Wildfowl were very abundant as they pushed up the river. At last they entered Sturgeon Lake, and reached Cumberland House. They kept on up the stream, ascending the north branch, meeting Indians from time to time, some of whom were Assinaboines, called Assinaboines of the Saskatchewan, and as they had before this purchased some horses, they were fearful that these might be stolen. It was now September, and the bushes were loaded with chokeberries and service berries. Buffalo paths running in every direction were deep and numerous. Ammunition was issued early in September to the men for purposes of defense. Soon buffalo were met, and here Henry first ran these animals over the rough ground of the plains, covered with large round stones, and pierced at frequent intervals with badger holes. On September 13 he reached Fort Vermilion, where was a fort of the Hudson's Bay Company, and found the Blackfeet all about. Here Henry wintered, expecting to be visited by numerous tribes from the south.

Just before Christmas, in December, the Blackfeet invited Henry and his Hudson's Bay neighbor to come to their camp and see buffalo driven into the pound. The two men went in dog sledges, and were kindly received by the Indians, but the weather was insufferable, being foggy, and the wind was contrary. They viewed the pound, where they "had only the satisfaction of viewing the mangled carcasses strewn about the pound. The bulls were mostly in retire, none but good cows having been cut up. The stench from this inclosure was great, even at this season, for the weather was mild." From the lookout hill, buffalo were seen in enormous numbers, but as the wind was unfavorable, every herd that was brought near to the pound dispersed and ran away. After having been there two days, Henry became disgusted, and returned to the post; but he was followed by a number of Blackfeet, who arrived the next day, and told him that they had scarcely left when a large herd was brought into the pound.

Under date of September 6, 1810, is an entry which will interest those who took part in the well remembered discussion of Kipling's poem, "The Red Gods." "Gratton erected his bellows and began to make irons for the poles of the Columbia canoes." This 94-year-old contribution to the literature of the subject is interesting.

On the 26th of September, 1810, Henry set off on horseback, westward; the canoes, of course, coming up the stream. Their destination was Rocky Mountain House, a post located on the north Saskatchewan River, a mile and a half above the mouth of Clearwater, three miles below Pangman's Tree, so named from the fact that Peter Pangman carved an inscription on it when he first sighted the mountains in 1790.

On the way up the stream they found signs of beaver extremely abundant; but although one of the Indians set traps in the hope of taking some, the winds blew the smoke of the camp toward the traps, and the beaver did not leave their houses that night. The next day, however, they took two, the signs still showing the presence of great quantities of beaver. Ahead of Henry was a camp of Sarsees, twenty-five lodges, which had just left, for at their camp on Medicine Lodge River, a branch of the Red Deer, the fires were still burning. They must have made a good hunt here, since the bones of beaver, bear, moose, elk and buffalo lay about their camp in great quantities. That afternoon they met five lodges of Bloods and Sarsees, with whom they camped. Game was abundant, and Henry notes on the 5th the appearance of a herd of strongwood buffalo, the bison of the hills and mountains, so different in appearance and some of their habits from those of the prairie. Here, too, were seen the fresh tracks of a grizzly bear, measuring fourteen inches in length.

When they reached the fort they found the Piegiens friendly and quiet, but suspicious of the whites. "These Piegiens had the fresh hide of a bull they had killed at the foot of the Rocky Mountains. This was really a curiosity; the hair on the back was dirty white, and the long hair under the throat and forelegs iron-gray, and sides and belly were yellow. I wished to purchase it, but the owners would not part with it under any consideration." It is well understood that white buffalo, or those that are spotted, or indeed of any unusual color, are very highly esteemed by the tribes of the plains. Henry has referred to this before, and I have called attention to the sacredness of the white buffalo's hide among the Blackfeet, Bloods, and Piegiens, and among the Cheyennes further to the south.

It was now an active time, Bloods, Piegiens, and Sarsees coming and going, bringing in some beaver, for which

they received tobacco, rum and liquor, and occasionally a gift of clothing to some man who had brought in an especially good lot of beaver. On November 4 the traders had in store 720 beaver, 33 grizzly bears, 20 buffalo robes, 300 muskrats, 100 lynx—not a bad trade for the season of the year.

November 9: "I rode up river about three miles to the rising ground on the north side, where Mr. Pangman carved his name on the pine in 1790. This spot was then the utmost distance of discoveries on the Saskatchewan toward the Rocky Mountains, of which, indeed, we had a tolerable view from this hill. The winding course of the river is seen until it enters the gap of the mountains, a little east of which appears another gap, through which, I am told, flows a south branch that empties into the Saskatchewan some miles above this place. The mountains appear at no great distance, all covered with snow; while we have none." The arrival this day of an express from below brought the news that an act of Parliament had been passed prohibiting spirituous liquors among the Indians.

The weather was now cold, the river occasionally choking up with ice, and snow fell. The canoes were split by the frost, and axes broke while the men were chopping with them. Men were sent out to get dogs for hauling, and as soon as the country became covered with snow, dog trains were sent down to lower Terre Blanche to bring up goods. Gros Ventres of the Prairie had just returned with sixty horses, stolen from the Flatheads, and others had gone off to try to take more. On the 27th of December, "Our hunter had killed a large grizzly bear, very lean, and, as usual with them in that state, very wicked; he narrowly escaped being devoured. They seldom den for the winter, as black bears do, but wander about in search of prey."

In February Henry made a trip to the Continental Divide, to where the waters of a branch of the Columbia rise within a very short distance of the Saskatchewan. He was obliged to tell the Piegiens that he was going down the stream instead of up. Travel was by dog sledge, and over the frozen river, in which there were no air holes to be seen. On the way up, during the first day they found a carcass of a deer that had been killed by wolves. The ice was of great thickness, so that at night, when a man was endeavoring to get water from the stream, he was obliged to cut with an ax for an hour before it flowed. As they went up the stream, the banks grew higher and near together, and at one point there was seen tracks of animals coming down the mountains among the rocks. "These are the gray sheep which have been seen about this place, and which delight to dwell among precipices and caverns, where they feed on a peculiar sort of clay." Dr. Coues places after this statement a question mark in brackets, but the reference is evidently to a "lick," a place where a mineral spring has given a saline taste to the earth round about. Such licks are common enough in the Rocky Mountains and many other places, and are regularly visited by sheep, which often gnaw away the earth in many places and over a considerable space. A little further up the stream they were in full view of the mountains. The river being low, flowed through numerous channels, some of which were free from ice; others, which were frozen, had water flowing over the ice. On account of the wind there was little snow on the gravel bars, and the hauling was hard for the dogs and bad for the sleds.

On the 5th, he overtook his people, who had started several days earlier, and who had killed three sheep and three cows. Here Henry stopped for a day, and sent off three men to hunt sheep, wishing to obtain the entire skin of an old ram. This they failed to secure, but one of them had seen the track of a white goat. The next day, keeping on, sheep tracks were seen, and Henry indulges in reflections on the wonderful places which they passed over, and their sureness of foot. The following day, "Shortly after leaving camp, we saw a herd of about thirty rams feeding among the rocks on the north side. They did not seem to be shy, though the noise of our bells and dogs was sufficient to have alarmed a herd of buffalo two miles off. The rams stood for some time gazing at us, and did not retreat until some people with dogs climbed up to fire at them, when they set off at full speed, directing their course up the mountain. I was astonished to see with what agility they scaled the cliffs and crags. At one time I supposed them hemmed in by rocks so steep and smooth that it seemed impossible for any animal to escape being dashed to pieces below, but the whole herd passed this place on a narrow horizontal ledge, without a single misstep, and were soon out of sight." Here Henry seems to have seen his first flock of dippers, which interested him not a little; and on the ice above this point he found the remains of another ram which had been run down by wolves and devoured.

There were plenty of buffalo on Kutenai Plains, which they now reached, but they killed none, a hunter firing at a sheep having driven them off. Moose and elk were plenty here, as well as white-tailed deer and grizzly bears; and here, too, were seen "white partridges"—in other words, white-tailed ptarmigan. Still following up the river, the snow grew deeper and deeper, so that at length they were obliged to take to snowshoes, and to beat a path for their dogs. On the 9th of February they reached the Continental Divide, and passing through thick forest, came to a small opening where three streams of Columbian waters join. The brook thus formed is Blueberry Creek, which runs into the Columbia. That morning, when leaving camp, in the Kutenai Park, a place where the Kutenais used to drive buffalo over the cliff, Henry had left his hunter, Desjarlaix, behind, telling him to try to kill a white goat. Shortly after his return to the camp, his hunter came in and told Henry that he had seen large white goats on the mountain, directly off Kutenai Park, where he had been trying since daybreak to get a shot at them. "He was almost exhausted, the snow being up to his middle, and the ground so steep as not to admit of snowshoes. He had worked about a quarter of the way up the mountain, but had been obliged to abandon the attempt to reach the animals. They did not appear the least shy, but stood gazing at him, and cropping the stunted shrubs and blades of long grass which grew in crevices in places where the wind had blown the snow off. As I desired to obtain the skin of one of those animals, I gave him dry mittens and trousers

to put on, went with him to the foot of the mountain, and I pointed out a place where I supposed it was possible to reach them. We could perceive all three, still standing abreast on the edge of a precipice, looking down upon us, but they were at a great height. He once more undertook the arduous task of climbing up in pursuit of them, while I returned to the camp. A hunter in these mountains requires many pairs of shoes (i. e., moccasins), the rocks are so rough and sharp that a pair of good strong moose-leather shoes are soon torn to pieces. The white goat is [not] larger than the gray sheep, thickly covered with long, pure white wool, and has short black, nearly erect horns. These animals seldom leave the mountain tops; winter or summer they prefer the highest regions. Late in the evening my hunter returned, exhausted, and covered with ice, having labored in the snow till his clothes became all wet, and soon after stiff with ice. He had ascended half way when the sun set, which obliged him to return."

The next day Henry wished to send his hunter out again, but the poor fellow was so done up and his legs so swollen by the exercise of the day before, that the effort was given up. They therefore started down the river, past the camp of the day before, where they found that the men had killed sheep, buffalo, a large black wolf, and a Canada lynx. The following day they saw a herd of rams on the rocks, and tried to get a shot, "but one of our men, being some distance ahead, and not observing them, continued to drive on, which alarmed and drove them up into the mountains. I regretted this very much, as the herd consisted of old rams with enormous horns; one of them appeared to be very lean, with extraordinarily heavy horns, whose weight he seemed scarcely able to support. When the horns grow to such great length, forming a complete curve, the ends project on both sides of the head, so as to prevent the animal from feeding, which, with their great weight, causes the sheep to dwindle to a mere skeleton and die. We soon afterward saw a herd of buffalo on the hills near the river, but on hearing the sound of the bells they ran away, and appeared much more shy than sheep." Continuing down the river, they reached the fort, February 13.

Henry finished the winter at Rocky Mountain House, and in May, 1811, started down the river to Fort Augustus.

There is now a long break, extending over two years, in Henry's journal, the third part, as Dr. Coues has divided it, being devoted to the Columbia. November 15, 1813, finds him at Astoria, the scene of so many trials of fur traders, and the place about which so many books have been written. The journal for the two intervening years has not been discovered. It may yet turn up, and if it shall, will undoubtedly give us much interesting information. What we do know is that he came to Astoria from Fort William, but how he got there we do not know. They came, however, in bark canoes, for a contemporary writer says so much as that. Not only was Henry here on the west coast, but his nephew, William Henry, who had been frequently associated with him in past years, even back on the Pembina River. The character of the Indians here interested Henry, and he makes his usual frank and not always elegant comments on them. On November 30 the British ship Raccoon reached Astoria, captured the place, and thereafter it was a British trading post, under the name Fort George. Duncan McDougal, the chief factor, had left the Northwest Company to enter Mr. Astor's service, in 1810, but without any particular hesitation he surrendered to the British ship, although the Indians were only too anxious to defend the place for the Americans, and to assist the white men in holding it. As a matter of fact, however, most of the employees of Mr. Astor were British subjects, and were only too glad to have the place taken.

There was a good deal of uncertainty as to whether the ship was British or American, and considerable alarm felt by the British sympathizers at the post. The story is well known. The Raccoon stayed at Fort George for about a month, and then sailed away.

Much time was expended on the final settlement of the accounts between McDougal, who had been Mr. Astor's representative at Astoria, and the representatives of the Northwest Company, who were now in possession; but at last this was all finished, and on December 31 the Raccoon made sail, and disappeared behind Point Adams.

Rains were constant, and they and their property suffered much from wet and dampness. With this spring, Henry for the first time seems to have seen the Indians catching smelts and herrings, and describes the well-known rake used on the western coast: "They had a pole about ten feet long and two inches thick, on one side of which was fixed a range of small sharp bones, like teeth, about one inch long, a quarter of an inch asunder, the range of teeth ascending six feet up the blade. This instrument is used in the smelt fishery." As is well known, the Indians sweep this instrument through the water in places where the small fish are schooled, and at each sweep of the rake, from one to a half dozen fish are empaled, when the implement being brought to the surface and held over the canoe, the fish are jarred from it into the vessel. On the 28th of February a ship, the Pedler, brought Mr. Hunt, who was second to Mr. Astor in the management of the P. F. Company, and headed the original overland Astor expedition in 1810-12.

There was now a gathering of all the partners and those interested in the Northwest Company and the P. F. Company, for a settling of accounts between Hunt and McDougal. The Pedler got under way April 2. On April 4 a brigade of ten canoes set off up the river. This left a small contingent at Fort George, and this contingent very ill provided. They had a little spoiled California beef, and a little bad grease. Besides this, all they had were the smelts which the Indians were catching, which were largely spoiled, and which the men would not eat, and the little provision that they could buy from the Indians, a few beaver, deer, and elk—called *biche* by Henry. Besides this, many of the men were ill, and fourteen were in hospital at one time. To help out the lack of sugar or molasses, they experimented in making a decoction of camas root, which produces a kind of syrup, preferable to molasses for sweetening coffee. Among the skins brought in by the Indians were occasionally those of tame cats, which Henry conjectures to be the offspring of cats lost from Spanish ships that had been cast ashore.

April 22 a ship was seen, which proved to be the Isaac Todd, and had on her Mr. J. C. McTavish, who was to take charge of Fort George, as governor. Work went on, loading and unloading the ship, buying provisions, the annoyances of small quarrels between various people. The entry in Henry's diary of May 21, 1814, is partly finished, and then ends with a dash; for on Sunday, May 22, Alexander Henry, Donald McTavish, and five sailors were drowned while going out to the ship.

So perished Alexander Henry, the younger, after twenty-two years of adventure, extending from the Great Lakes to the Pacific, and from the Missouri River north to Lake Athabasca. It may fairly be said of all the books that have been written by the early travelers and traders in America, this is the most interesting and the most curious. It is not—as its eminent editor has said—a book for boys and girls, but may be read with profit by men.

GEORGE BIRD GRINNELL.

Denuding the Mountains.

WYMORE, Nebraska, Sept. 20.—*Editor Forest and Stream:* The editorial in the current number of *FOREST AND STREAM*, as well as the letters of Mr. C. P. Ambler and Mr. Charles Cristadoro on the subject of forest reserves, contain many practical ideas on a subject in which we of the West are especially interested; and while I have not the scientific knowledge to be of much assistance in discussing the subject, or kindred subjects, I want to make an effort to suggest a few thoughts. In the first place, after many years' residence in the arid West, I have discovered that we always have our best crops when there is an abundance of snow in the mountains west of us. The snow melting in July and August supplies the streams used for irrigating purposes at that season of the year when it is most needed; and I am told by men who have studied the subject, that this melting snow cools the air and condenses the warm and moist air meeting it, until it comes back across the plains in rain. From this I conclude that snow storage is of the first importance, and this brings us right back to the subject of forest reserves. The great pine forests of the Rocky Mountains are the great snow storage reservoirs.

But these are being cut at a fearful rate, and I would like the assistance of *FOREST AND STREAM* or its readers in finding by what authority it is being done. I have four acquaintances who have formed a company and gotten possession of a large body of timber land about seventy-five miles from Denver along the new Moffatt Railroad, and this company already has its saw mills at work cutting and sawing the timber. One of the parties tells me that they get title to the land, that it costs them \$2.50 per acre, with additional cost of advertising, etc., making the total cost about \$400 a quarter section; and that they used some script, and had the assistance of other parties in taking the land, who afterwards conveyed to the company. He also said it took some manipulation, but that they had a good thing, and no doubt they have. This same thing is being done by other companies and individuals, and the mountain lands denuded of its forest.

In the U. S. Statutes that I have (not up-to-date, however), I find no authority for this, and would like to know where it can be found. If it is found, would it not be well for the great *FOREST AND STREAM* family to put our shoulders to the wheel, and by a united effort get the authority repealed? While getting this authority repealed, let us make an effort also to have the registers and receivers of our land offices put on a salary, and take away the \$14 filing fees now allowed by law. The fee system has been one of the great evils of our land laws. Under the salary system, these officers would represent the Government; as it is now, they are retained by, and represent, the fellow that wants the land. If he does not get the land, they don't get the \$14.

Mr. Ambler has given us the watchword—"Stop the indiscriminate cutting of timber."

A. D. McCANDLESS.

A Pillow of Pine Needles.

COMING home a few evenings ago I detected the "aroma of the pine" about the room, and on inquiry, a small pine-needle pillow—a department-store product—was produced. When I retired that night I placed it under my pillow, and the memories brought back as I inhaled the fragrance of the woods, set me dreaming of the lakes and the forest. I was carried back to the lake shore, the smouldering embers, the stars overhead, the splash of the water on the beach, the cry of the loon and the sighing of the wind through the pine tops. And I dreamed that, awakened by an early robin, I turned out from my lean-to with its bed of boughs, took a dip in the lake, and rigged my rod, worked my way in the boat along the silent and likely spots where the trout were on the alert for an early breakfast. I picked up a trout alongside a submerged tree-top, two or three more by a sunken log, and yet another alongside a rock, and I return to camp. The bean-pot and coffee are in evidence as we fry our trout. The smoke from the birchen logs adds fuel to our appetites and flavors our woodland meal.

How fragrant are the woods, and pleasant are the waters to look upon. I pass from one spot in my dream to another. I am living over again trips that have been many moons apart. I am out on the prairie one moment, following the dogs and the chickens, and the next amidst the briars and scrub oaks after the whirling Bob White. The cool, damp shades of the swamp encircle me as I wade along after the dog and hear the woodcock flush.

Now I am out upon the south exposed hills amidst the birches and hemlocks and the lordly partridge and the fully grown woodcock engage my attention. I dream I am out upon the wind-swept stubble, well covered in my pit, and I listen expectantly to the long V far in the distance swiftly honking its way toward me and the decoys.

And then again it is dusk, and I am on a duck pass between two rice lakes, and the mallards and teal twist and dart above my head.

Lord! what a night I have had all because of a little pillow of fragrant pine needles regaling my nostrils, and by association carrying me back to days spent with rod and gun.

CHARLES CRISTADORO.

NATURAL HISTORY

No Panthers in Maine.

BANGOR, Me.—*Editor Forest and Stream:* Maine is to many people a howling wilderness from one end to the other, and the mere mention of "woods" brings to the minds of these fearful ones visions of ravening wolves, bears and panthers, while the horrible, indescribable "Indian devil" lurks in the background, waiting for a chance to attack the unwary and inexperienced hunter who may be abroad unprotected. It seems to those acquainted with Maine's timberland territory almost ridiculous to attempt to "explain away" such erroneous ideas, but there are so many people of intelligence in other directions, who give to the world such strange ideas concerning the recreation regions of this State, that one feels compelled to rise in defense of the finest hunting and fishing region in the Atlantic States, if not in the country.

In all Maine there is not, and so far as one is able to ascertain never was, a real, live panther or American lion; and yet there are people living who tell the most wonderful stories of hairlifting experiences when face to face with enormous specimens of this lithe, strong but cowardly giant of American cats. In the course of a recent conversation with that thorough naturalist and hunter, Mr. Manly Hardy, of Brewer, than whom there is certainly no better authority on natural history of this State living, the writer was deeply entertained and interested in learning something about the occurrence (?) of panthers in Maine and their natural range.

Recent letters received by Mr. Hardy indicate one of those periodical awakenings for information on this subject, which occur every few years, or as often as some frightened individuals report having been through thrilling experiences with panthers or "Indian devils." So thoroughly stirred was Mr. Hardy by the several inquiries received, that he didn't rely upon his own knowledge, but wrote to some experienced hunters whom he knew, to see if such a thing as a panther had ever been seen or killed in the New Brunswick woods, which are naturally but a continuation of the same forest area.

One of the letters, in making the inquiry, suggested that the writer had already some slight information, or thought that he had, since he referred to the fact (?) told him by a son of the late Henry Clapp, of Brownville, who in his day was famous as a hunter and trapper, that Henry Clapp had killed a panther and had a fearful fight with one once. As a matter of fact, Mr. Hardy knew Henry Clapp very well indeed, bought all his skins of him for many years, and from personal knowledge of the man's experiences he knew that Mr. Clapp had never killed a panther in the woods of Maine, nor indeed had he ever seen one.

In 1852 Mr. Hardy's father began buying furs in Maine, and his business was continued after his death by his son, so that for an unbroken period of eighty years the present Mr. Hardy can trace the history of wild animal life in the woods of this State. In that time Mr. Hardy has been deeply interested in all questions pertaining to the natural history of his native State, and has been a keen observer, as his record as a naturalist proves. He has heard of a great many cases of panthers, appearances of so-called, and of killing at various times of these animals, and has spent much time and effort to trace the stories to a beginning. In every such case the story has been proved to be a hoax, with a wildcat as the original, or even less than that.

"In one case, occurring several years ago," says Mr. Hardy, "I felt as though I had something positive to work on: It was prominently reported in the papers that a certain man in Aroostook county had killed a panther, and that the skin of the animal was in the hands of an up-river taxidermist to be mounted. I wrote to the man, whose address was given in full in the reports, and he told me it was nothing of the sort; to pay no attention to the story; that it was the yarn of an ambitious Boston drummer, who had set out to beat a story told by a fellow salesman, and that he had never seen a panther, much less shot one. This," concluded Mr. Hardy, "was the closest I ever came to getting actual knowledge of a panther killing in Maine, although I have followed every report in the papers for years, every such case proving false when traced to its source."

"Dave Libbey, of Newport," continued Mr. Hardy, "who writes under the name of 'Penobscot,' is certain that he once fired at a panther, and there is no more honest man living than Dave Libbey; but he didn't see the animal very clearly, and missed, and while Dave (I know him well) undoubtedly thought he saw and shot at an actual mountain lion, it is unreasonable to suppose that in all these years only one mountain lion has been in the Maine woods, and Mr. Libbey is the only hunter that has seen one."

Of course there are lots of reported encounters with panthers in various parts of Maine, and the stories of some of those who think they have seen these fearful animals are enough, almost, to drive sportsmen away from the State altogether. But it is safe to say, that there is not, within the borders of the State, any animal from which a man need have much to fear, unless possibly it is a bull moose in the rutting season. Then he is in no mood to be trifled with, and the sensible hunter will give his majesty a wide berth, as then is the close season on moose, except toward the latter end, when, by the use of the call, the moose may be lured within shooting distance.

"The only panther skin I ever saw in Maine," continued Mr. Hardy, "was offered me on the market at Bangor once. As I was going along through the square a man who knew me, although I didn't know him at

all, held up a panther skin and asked me what I would give him for it. I was interested at once, and asked him where he got it, saying that I knew it couldn't have come from Maine. The fellow then told me that it had been sent him from Washington by his brother, who was then in that territory.

"I once met a man who was an old hunter of panthers in the Rockies, and he showed me two small, insignificant looking hounds that he hunted them with, and it showed what cowards these animals are by nature, to know that, before I ever met him, he had killed thirty panthers with those dogs, and I knew of his killing several more before I left him. They are great cowards, and although they'll weigh as heavy as 200 pounds apiece, a small dog can so cow them that they are at the mercy of the hunter.

"But I don't pretend to know about New Brunswick, so I wrote down to Adam Moore, 'Big Ad. Moore,' we always called him, and asked him to get the experience of Henry Braithwaite, another old hunter. I have just heard from him that he never saw a panther in New Brunswick, and that I can put any man down as a liar who claims to have ever seen one there. He makes it very strong, and ridicules the idea of panthers in the woods of the Province."

Asked by a correspondent as to the "Indian devils" reported to be frequent in the woods, Mr. Hardy tells some very interesting things to bear out his statement that an "Indian devil" is any animal seen or heard in the woods that the person seeing or hearing can't tell what it is. At one time and another the woods of Maine have been inhabited, according to the vivid imaginations of superstitious woodsmen, with every dangerous animal of tropical and far eastern countries, and the so-called "Indian devils" is nothing but a loup-cervier, a large wildcat, or a hedgehog, all of these and others having at times figured in "real experiences" with this dreaded monster of the woods of Maine.

HERBERT W. ROWE.

Wild Life at the World's Fair.

ST. LOUIS.—There is scarcely a bird that flies in the air, a beast that walks upon the earth or a fish that swims in the sea water, to whatever part of the world it may belong, including even the creatures that had the hey-day of their existence in the prehistoric age, that is not in some way represented, at least in picture, effigy, skeleton or mounted specimen. But there is also a goodly representation of living animals. The live stock exhibits are of extraordinary size and excellence, and wild animals are to be found of every kind, and from every portion of the globe, including several very extraordinary species that have never before been on exhibition in the United States.

A great variety of living birds, to all extents and purposes in a free state, are exhibited by the National Zoological Park (under the auspices of the Smithsonian Institution) in Washington city, in an immense aviary near the Government Palace, consisting of several acres of ground covered with a wire netting large enough to rise above the tops of the trees. This is longitudinally divided into two compartments. Among the species represented in the one devoted to the larger birds are the American egret, snowy heron, demoiselle crane of southern Europe, sacred ibis of Africa, the wood ibis, white ibis, brown pelican, white pelican, night heron, ambriga or snake bird, cormorant, Canadian goose, snow goose and blue goose, and especially the roseate spoonbill, who is undoubtedly "the belle of the ball." On the other side are smaller birds, such as the nightingale, goldfinch, pine siskin, bunting, Indian dove, Java sparrow, bullfinch, canary finch, California partridge and variety of wild ducks, such as the green-winged teal, blue-winged teal, wood duck, wandering tree duck, Java tree duck, mandarin, pintail and mallard. Particularly striking are the exquisite blue and yellow tropials from South Africa, the cardinal grosbeak, Australian wood pigeon, crested pigeon, white or albino Java sparrow, blue bird, indigo bird, red-headed woodcock, and nonpareil finch. Much attention has been attracted by the curious nests built by the African red-billed weaver birds since they have been on exhibition. They are made in two parts, so as to enable the birds to escape with their young from monkeys, snakes, and other enemies.

Elephants, camels, dromedaries and llamas are in evidence in large numbers in several of the Asiatic shows. E. C. Cowston, of South Pasadena, Cal., the father of the ostrich breeding industry in the United States, exhibits a herd of several score of fine ostriches, including the champion racing ostrich, Black Demon.

One of the greatest attractions at the Chicago Exposition of 1893 was the display of trained animals by Hagenbeck, who supplies, from his headquarters at Hamburg, Germany, practically all the wild beasts, both trained and untrained, possessed by any of the great circuses and menageries of America and Europe, but who had never previously exhibited in the United States. He has now returned for the first time since, with three times as many animals as he had then, and a show altogether superior in every way. Besides all the specimens to be found in the largest menageries, and exhibitions of animal skill, intelligence, and amenability to training far surpassing those to be seen in the best circuses. Hagenbeck's has several animals of quite unique interest, such as (to say nothing of the frolicsome baby elephant and other very interesting specimens of animal infancy) the zebrule, a cross between the horse and the zebra, already of commercial importance; a very curious un-named cross between the lion and the tiger, and, above all, a blue-nosed mandril, a fantastically shaped and rainbow-tinted monster of the monkey family.

Isolated animals are found in other parts of the Exposi-

tion, sometimes the most unexpected ones; for example, the tricky little monkey that divides the honors in the Negrito village with the curious little Philippine pigmies; but the nearest approach to the ordinary out-of-door zoo is the outside fish and game exhibit of Missouri, situated just west of the Forestry building, and under the charge of J. H. Ridgway, the State Superintendent of Fish and Game, and a brother of the celebrated Washington ornithologist.

In the center is a large pond, surrounding which are cages containing specimens of the puma, mountain lion or American panther, gray wolf, gray fox, red fox, coyote, black bear, raccoon, opossum, woodchuck or groundhog, red squirrel, eagle, wild turkey, wild goose, wild duck, great horned owl, quail, China, English or ring-neck pheasant, golden pheasant, silver pheasant, and Amherst pheasant. The pheasants are particularly showy birds, familiar to the hunter, but very remarkable to those who have never seen them. There is in the collection an albino white squirrel, pure white with black eyes.

The collection of wild turkeys is the best in the State, including ten fine birds captured especially for this display, and one of them bearing traces of his capture in a missing leg. The ordinary rail-pen trap was used, into which they are baited through a hole in the ground that enters it from below, and which they are unable to find again.

Among the wild geese are the Canada goose, Hutchins goose, cackling goose, greater snow-goose, lesser snow-goose, white-fronted goose, and blue-winged goose. The only other variety found in the State is the barnacle goose, which only comes occasionally, and is ordinarily a saltwater bird.

The duck cage originally contained sixteen out of the twenty species in the State, and there still remain mallards, dusky ducks or black mallards, pintail, blue-winged and green-winged teal, baldpates, wood duck, and Texas tree duck. One of the mallards seems to have been missed in the wing-clipping bee held early in the season, and consequently flies about at will through the open top of the inclosure, sometimes doing sight-seeing around the Exposition grounds, but more frequently swimming in the open pond, instead of the little arm of it to which alone his imprisoned comrades have access.

The pond is inhabited chiefly by catfish and buffalo fish. It now contains also a sturgeon. The king of the pond is a large Missouri pelican, by far the most solemn and important looking personage to be seen in the Exposition.

The Wapiti.

BY W. A. WADSWORTH.

From the Report of the New York Fisheries, Game and Forest Commission.

THERE is no animal left on earth that compares in majesty and beauty with the American stag (*Cervus canadensis*), which I shall speak of as the elk "because everyone else does it" (an excuse for wrongdoing since the beginning of sin), and if he can be successfully introduced into the Adirondacks he will be the greatest addition that can be made to their attractiveness. He is really most at home among the grassy slopes and forest glades of the real mountains, and may hardly take kindly to the rolling, thickly timbered country of which our State forest is principally composed. He wants open spaces over which he can roam, and succulent grasses on which he can feed, and the leaves, sprouts, marsh growths and lily-pads, so loved by the moose and deer, are not natural to him.

It is true they were found all along the Alleghenies from Virginia upward, and the hat-rack in our house in the Genesee Valley is made of elk antlers killed there some sixty years ago. But western New York contained more glades and open spaces in its forests, and the underbrush was less dense than in the North Woods. They are all gone now, not only from our own State, but from all the vast expanse between there and the Rocky Mountains, and the great droves of thousands which many living men have seen, have been so broken up that elk practically exist in any quantity only at the Yellowstone Park, where they are preserved by the National Government, but slaughtered whenever they get outside of its limits, which do not extend far enough to the southward to fully take in their winter range.

There is a great local pretense that they are killed off by "Eastern dudes," "Toorsts," "Indians," etc.; but the majority are taken late in the season by men who go into the mountains for meat for winter use, and by pot-hunters wanting the hides or teeth. The former have little value, but the two small tusks called the "ivories," found in the upper jaw, have, by a strange perversion, and without the approval of its officers, become fashionable as a badge among some of the members of a well-known society.

So many a noble beast has died in the snow, leaving head, hide and carcass to rot untouched, to furnish a foolish ornament to some fat and worthy club man who never saw forest, mountain, or camp-fire, and is so ignorant of the lore of his own fraternity as not to know the difference between the great prehistoric Irish elk, from which it derives its name, and the American wapiti, which is technically no elk at all.

We have heard so much of the sport of elk hunting from all sorts of writers from the President down, that it seems ungracious to find fault with it. But they are a very large animal, a naturally tame and stupid animal, and a gregarious animal. With the wind in my favor, and by keeping absolutely still, I have had a herd browse up so close that I could have touched them with my hand; and during the rutting season the bulls will, if alone, come trotting up to even a very poor imitation of their "whistle," or keep on answering it if with the herd.

I do hope that if introduced here it will be as a "beast

of ornament," not as a "beast of the chase." One live elk is worth more to any forest than a ton of his meat, and neither are worth failing to welcome all our fellow-citizens to our beautiful State, and making them forget its advantages by vexatious game laws founded on local prejudice and petty spite.*

The wapiti is a large dun or slate-colored deer with slender legs, a black face, pointed nose, and a curious looking light colored patch on the rump. The males weigh about eight hundred pounds or more, and their fine antlers are too well known to need description. They formerly inhabited the slopes of the Alleghenies, and roamed in vast bands over the broken prairies of the upper Missouri. To-day they are found only in the western mountains, and I can but describe their habits as I know them there. It is the common usage to speak of bull, cow and calf elks; but there is nothing bovine in their ways and habits, the young especially being far more like colts than calves in their play, and having the same trick of working their lips when trying to make friends with an older or stronger animal.

They are born in May or June, and stay with their mothers during the summer; but they are foolish, trusting little beasts, and will come whinnying at a gallop toward a stranger if separated from their dams. Toward the end of August the females begin to get together, and are soon joined by the males, over whom, as well as their young, they seem to keep watch, being continually on the lookout while feeding, and moving ahead on the march, the big bull usually bringing up the rear.

The male drops his horns in early spring, and in early autumn retires high up the mountains so as not to be bothered by flies during the slow process of growing new ones. On the spot from which the old horns fell, there appears a spongy growth, seemingly all blood vessels, which increases at the rate of nearly an inch a day, gradually hardening around a central core until the full size is reached. Then, when fully hardened, the outer skin, or "velvet," dries up, splits, and seems to itch, for they are continually rubbing it off against small trees, "shaking" (them) as it is called, during which time, of course, they are making so much noise and so occupied that they are easily approached. About the first of September, fat, sleek, and with branching antlers, they come down to join the herd.

Might makes right among deer as well as among men, and dispositions vary as with us. There certainly is some fighting; and it really would seem hard to spend so much time and labor growing such glorious things to butt one's enemies with and never use them. But I have rarely seen a drove, however small, in which there were not several bulls, and they are usually feeding quietly together. If a stranger comes whistling through the timber saying he is "the best man," the statement is not taken on faith by the head of the herd, and there is trouble immediately; but one curious fact is that the young bulls, instead of staying and watching the fun, as men would, flee in a panic of terror.

On the whole, they seem a peaceful animal when undisturbed, browsing in bands along the mountain side and walking every now and then out on some jutting crag or promontory, where they seem to enjoy the broad outlook, and make superb pictures against the sky-line. When frightened, they go off at a long, lumbering trot, taking naturally to the most difficult ground, over which they seem to travel as easily as if it were smooth.

The elk "whistle" varies very much, so that it doubtless has different meanings; but it is assuredly not a sign of fear or signal of danger, as is often stated. It is a defiance, and is promptly answered by any other bull that hears it. If he is with his herd he usually stays there waiting for the stranger; but if alone he is apt to start toward the sound to investigate, and he will come up pretty close before deciding what to do; I have seen them come within fifty feet of a pack train in answer to an imitation of it, and then, notwithstanding the noise and talking, follow along abreast for a mile or so, challenging at intervals, and never over one hundred yards away.

The sound itself is at times a series of gasping grunts, resembling the beginning of an ass' bray followed by a distant steam "siren." At other times there is a musical whistle running through several notes, which, rising clear and sweet through some lonely mountain glen, can neither be forgotten, imitated or described.

It may interest some whose hunting yarns have been questioned to know that among the early settlers there was a story that elk fell down in a fit when startled, which may account for the numberless persons who say they have shot them, seen them fall, and never found them; for, strange as it may seem, even such a big beast can be missed with a modern rifle, as I personally know. And they are said to like horses and dislike sheep, though they have the sheep trick of traveling in single file; and I have seen a yearling bighorn ram walking solemnly along a mountain trail after a big bull elk.

*The laws of Wyoming require every non-resident of that State to pay a license of forty dollars, which allows him to kill two elk only; and also that he shall not go hunting unless accompanied by a hired "guide," who will act as a spy on his actions. No one but a resident of Wyoming can be a guide; but any resident can by paying one dollar, whether he knows anything about the mountains or not.

A Squirrel Saving Club.

A UNIQUE club has recently been organized in Evanston for the preservation of squirrels. Co-operating with the school children, who form its membership, the policemen of Evanston have established stations for the distribution of nuts and grain to the city's pets. One-fifth of the 500 squirrels are being fed by the police department, while donations are constantly arriving from Evanston families to the "squirrel fund." The work of the school children is done from six school houses, in each of which a branch club has been organized. Boys who shoot squirrels are being arrested.—Detroit News-Tribune.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

All the game laws and fish laws of the United States and Canada are given in the "Game Laws in Brief."

Some Animals I Have Studied.

IX.—An Obedient Pig.

WHILE sojourning in central Illinois we had a young sow, which died, leaving us one tiny, disconsolate pig. I took it to the house, and we decided to try to rear it "by hand"—although but a short time previous we had woefully failed with two others. Not only had we failed, but we had been completely disgusted with the whole pig creation by the incessant and horrible squealing and the ungrateful biting and kicking of the stubborn little foundlings, which absolutely refused to have anything to do with us. But this one was teachable at the start, looking intently into our faces whenever we spoke to him, and patiently submitting to our handling, albeit he was surprisingly independent, being "lively as a cricket" the first hour of his birth. True, he "had a mind of his own," and promptly manifested his displeasure whenever offered anything entirely unsuitable, and even behaved arbitrarily toward things he did like, insisting on upsetting and mussing all vessels of food offered him—at first. But he managed to absorb enough to live, and about the third day approved of a plan of feeding we had by that time devised so as to take his meals gladly and skillfully. All ordinary human methods of feeding a pig had been tried and discarded while experimenting with the other two. Watching this one's instinctive rooting and kneading motions, I at once conceived the idea of giving him something to satisfy that propensity, instead of merely something to drink; and which at the same time should yield him nourishment. I tried light, spongy bread, soaked full of warm milk. But this was too tender; he soon punched it to pieces, scattered it, and squeaked with disappointment (not in a discordant, hateful manner, as had the others, but in tones that were either plaintive or comical, always). So I tried the toughest, most insoluble biscuit I could find (probably one of my own making—no woman nor professional cook could hope to equal me in evolving indestructible biscuit). It was a success. The battle of life was won. He was delighted—and so were we. In a few days he began to gnaw off portions of the bread and swallow them with the milk. After that, it was easy to coax him to eat warm potatoes, boiled cabbage, beans and peas. I have told this in detail, hoping some other benevolent would-be pig-saver may grasp easy success at once, and be spared the usual annoyances.

The house cat was at first alarmed at the newcomer's lively, erratic movements and clattering noises, and behaved toward him in a manner which—though it would take too much space to explain why—suggested that we name him "Bug," which we did. And in two or three days he accepted the name and afterward promptly responded to it on every occasion. The cat also soon comprehended the joke and showed that he knew who was meant whenever "Bug" was mentioned.

The pig grew slowly, but always seemed perfectly lively and healthy, save that he acquired the annoying habit called "stump-sucking," common to mammals prematurely weaned or orphaned—as in the case of a cat recently described in FOREST AND STREAM by some puzzled writer. I would herewith say to him that he has my sympathy, as I believe there is no cure for the habit when begun early, or when caused by too sudden weaning; though when adopted at or near maturity, by mere association with some "stump sucker," removal from such company and a few severe rebukes on slightest attempt to perform the trick, would be likely to reform any intelligent animal. I believe I could have prevented Bug from confirming the habit had I at once undertaken it; but at first it looked so comical that I could not find it in my heart even to scold him. Besides, the motion is instinctive at birth, and if the young creature is denied its natural mother it must seek a substitute; and the less satisfactory the substitute, the more likely the natural infantile performance is to become an unnatural, permanent habit. While the habit is not dangerous, it soon becomes monotonous, and delays or prevents development, by keeping the animal from spending sufficient time in taking real nourishment. If some contrivance, attractive to the creature and containing an abundance of suitable pabulum, so arranged as not to be too rapidly yielded up and ever maintained at the right temperature, could be put in its way, it might be that the orphan, after a suitable time, could be gradually weaned away from it and settled to the eating of solid food without continuing the "baby habit;" but it would be necessary to gradually thicken and harden the food in the implement, and the same time making the outside feeding more and more attractive, which, you see, would be very troublesome and expensive, so that few could afford to undertake it, even for a valuable colt, not to mention a common pig or kitten.

When the pig became able to live on solid food, he was turned loose in the yard and allowed to roam, night or day, through the garden as well; and now he began to show his extraordinary affection for us, by learning to leave everything unmolested that we forbade him, by walking with the utmost carefulness among the young chickens and turkeys—which fairly swarmed about him in daytime after the gnats which encircled him—and by always coming as soon as possible when called. His submissiveness resulted entirely from love, not fear, for it was never necessary to punish him severely during his whole lifetime. Once, after he had learned to eat raw potatoes, he went out into the patch and uprooted a whole row before being discovered; but as soon as I yelled, "Bug! Get out of that, you rascal!" he fled, grunting and squealing his apologies. He never again disturbed them. We had a wild strawberry patch in a ravine. He liked to go there with us, and the first time he ran eagerly ahead, mangling many of the best berries. We simply pushed him gently behind us, saying: "No! No, Bug! Back! You mustn't go ahead!" After which, without protest or resistance, he quietly remained in the rear, eating contentedly the over-ripe and deformed berries. He would eat a berry, grain of corn or crumb of bread from one's hand without the slightest injury or pain to the latter. No dog was ever more careful. At two months he had perfectly

learned such commands as: "Get out of that!" "Let that alone!" "Quit that!" "Go away!" "Stand still!" "Come here!" "Lie down!" "You may have that!" "Go ahead!" Yet it was generally necessary to prefix "No, no!"—rapidly uttered—to the fifth order, or to wave the hand toward him in a repelling manner. No motion or gesture was necessary with the other orders.

But his most incredible characteristic was his woman-like gentleness and cat-like cautiousness. No living thing is more innocent or careless about keeping out of the way of moving objects than young turkeys are; yet he would lie down in a packed flock of them without squeezing even the slowest—and how to do so he taught himself. They simply would not move aside one hair's breadth; so he would begin by kneeling, then slowly, almost imperceptibly, he would lean to one side, gently pushing them from under as he settled down, though they were so heedless, so unmindful of their danger, that when he settled his last two inches, some soft, downy Turk would just be creeping serenely from under his comparatively huge bulk.

This wonderful feat was performed every day—often several times a day—except when raining, throughout the vernal season, with unvarying success, for he was popular with the turks until they were nearly matured.

Only once did he hurt a turkey—nay, he didn't do it then; the turkey hurt itself, using him as a means. It caught one of its legs between the toes of one of his hind feet when he lifted it to take another step. The scene that followed truly "beggars description." He stood perfectly still, holding his foot five inches above the ground, and squealing with horror while the poor fool Turk, then about the size of a leghorn hen, chirped and fluttered and twisted about. I witnessed the whole of the accident. When I caught the turkey and released it, the pig seemed as sorry as a dog who has made some unpardonable error. But the poor turk's foot was turned wrong-side-before, and it was never set right.

I have not over-estimated this wonderful pig in anything; instead, I have hesitated to describe even his commonest traits, lest I provoke ridicule, since even the great Audubon, whose name I hold sacred—but no matter, he has plenty of friends, and time will yet vindicate him in everything but the candle-snuffing. I thought myself that he had been deceived, juggled with, about that, as soon as I read his accounts; yet, nothing is impossible.

It was pitiful to see that pig trying to hurry to his feed, with forty young, helpless, serene turks fairly choking his progress, so that he dared not lift a foot, but must shuffle slowly and painfully along, while almost bursting with impatience.

I don't recollect how long he lived, but think about eight months. He died quite suddenly, and from what cause I never discovered. But he lived long enough to win many human as well as animal friends, and to achieve all the renown a reasonable pig could desire. And always, to the day of his death, he was gentle, careful, cleanly and obedient—the most intelligent, faithful and trustworthy brute (leaving a few dogs out of the calculation) I ever intimately knew.

L. R. MORPHEW.

Stories of the Good Green Wood.

STORIES OF THE GOOD GREEN WOOD. Thomas Y. Crowell & Co., New York, publishers.

This is an exceptionally instructive nature book, written by Clarence Hawks, the "Blind Poet of New England," whose previous works of like character, "The Little Foresters" and "Master Frisky," from the same publishing house, have won him popularity among the young people, and added to his already deserved reputation as an author and poet.

These stories are brand new, drawn fresh from the green wood, and are not dry enough to burn. Their subject-matter has been gleaned by personal observation in early youth under the tutelage of an intelligent rustic mentor by the name of Ben Wilson, who taught him to keep still in the woods if he wished to see anything; and any sportsman who will condescend to accept the various hints proffered will gather a stock of wood lore of rare quality, and thus be likely to enlarge their bag of game. Fox hunters will learn some tricks of reynard which were inexplicable before. Squirrel hunters will detect the presence of the little animals by apparently meaningless signs; and they will discover that it is useless to hunt gray ones where there are red ones. His story of how the turtle got his shell is as good as any Indian legend, and the situation where the young truant who went chestnutting was persuaded to use his shirt for a nut bag, while he shivered in the frosty air, and then went home and sat for an hour, heroically, with it on, lest his mother should discover where he had been, is unique, if not dramatic. The illustrations by Charles Copeland are very true to nature, and he and the author are most fortunate in having been able to snap his kodak on a partridge in the act of drumming.

The wonder to all readers is how anyone blind from his youth up can write so vividly and accurately. The explanation would be that lapse of time develops and intensifies the spectra originally cast on the mental and optical lenses, instead of blurring and effacing them. Hawks says the best time to read the book of nature is "when autumn turns the leaves." But the leaves of the "Good Green Wood" may be read with profit and delight at any time.

CHARLES HALLOCK.

Didymus.

WYMORE, Nebraska, Sept. 20.—*Editor Forest and Stream:* It was with a sense of personal loss that I read of the death of Mr. Heade, the Didymus of FOREST AND STREAM. We have taken great pleasure in all his contributions since the paper first entered our home, especially in his hummingbird stories this summer. I had made a mental picture of him, as I have of all the FOREST AND STREAM family, and in that picture he appeared as a young man. He was so enthusiastic and entertaining that to learn that he was 85 years old was a surprise indeed. And what a splendid life his was.

A. D. McCANDLESS.

GAME BAG AND GUN

Notes From the Game Fields.

Pheasants in Massachusetts.

BOSTON, Sept. 24.—*Editor Forest and Stream:* At a gathering of a few officers of the State Association the past week Mr. Sylvester, president of the Wide-Awake Club, of North Attleboro, reported that one of the members, Mr. L. Morse, has been successful in rearing quite a number of quail this season, which were hatched by one of his bantams and are now strong, hardy birds. The sportsmen are watching this experiment with high hopes. Mr. A. B. F. Kinney also spoke of the live partridges raised in Worcester which have been mentioned in *FOREST AND STREAM*.

The solution of the problem how to raise our native game birds, especially quail and partridge, is worthy of the efforts of our sportsmen who have the facilities for making experiments in this line. I have known several persons who have made similar attempts, but met with failure. Should any of your readers know of successful experiments in this country I should be much pleased to hear from them through the medium of your paper.

The opinion prevails among hunters of experience in our State that the results of liberating pheasants by the State for the past ten years has accomplished very meagre results and has demonstrated that these birds can never be made to take the place of our native birds. The opinion prevails generally among experienced shooters, who have hunted them, that, even if the covers contained a hundred fold more than there are now, an open season of two weeks would suffice to clear them all up. All admit they are a handsome bird and enliven the landscape. As giving promise of future sport, very few look for anything of the sort. Some have gone so far as to tell me they "would as soon shoot barnyard fowl as pheasants."

In an educational point of view their rearing by the State may have been of some value. Again this effort on the part of the State may have had some tendency to stimulate owners of large estates to do something in the same line. So long as the money comes easy, and the legislators are so inclined, I do not propose to wage any warfare on those in authority, but I do hope they will seek other means of replenishing our badly depleted covers.

Mr. Andrews, of Hudson, who bought and liberated some quail last spring, suggests that an appeal be sent to all the "dog-and-gun" men of the State to refrain from killing quail this season, so as to give them a chance to reproduce next year—or, if not abstaining wholly, to be content with small bags. Mr. Andrews has recently become a member of the State Association for the sole purpose, as he says, of doing all he can for the preservation of our game and fish—more especially the former. He has taken the trouble to get lists of all hunters in his place, the city of Marlboro, which, by the way, he characterizes as "the city of poachers," and several neighboring towns. His earnestness is contagious, and if there were even a few such men in every town they would do much to leaven the masses.

Mr. O. R. Dickey, on a recent trip to New Hampshire, saw eleven passenger pigeons a few miles out from the city of Manchester. As usual he and his companion got some birds on this trip.

Looking through the market the other day I met a dealer who has handled game and has been active years gone by before legislative committees. He told me, with much apparent satisfaction, that only last week his wife saw three deer together on his farm in Natick, and one was a fawn. Reports have recently come to hand of deer seen in Newburyport and in Salem.

Several of our hunters are preparing for an early trip to the Maine woods and others to New Brunswick, whither Dr. Heber Bishop has already gone.

Mr. Davis, of Umbagog Lake, Me., says deer are as plenty as ever about his section, and he looks forward to a good fall business. As to the effect of flowing the Magalloway basin, as is proposed, he said the addition of another lake could not be otherwise than beneficial to business. Naturally those having farms or camps in the valley would be loth to leave them even if assured of liberal damages for loss of their property.

CENTRAL.

The Pennsylvania Outlook.

HARRISBURG, Pa., Sept. 26.—*Editor Forest and Stream:* Indications point to a fair supply of game in this State at this time. Notwithstanding our very severe winter, quail seem to be fairly abundant. For many years it has been the belief of this office that, where coveys of quail were allowed to run intact, that is, a large covey permitted to run without being broken up, by shooting or in some other way, two or three or more hens would lay in the same nest, the cock birds would fight over them with the result that no young would be produced; while, if the covey was shot down to say half a dozen or separated artificially, each pair of birds would produce a covey. This seems to be confirmed anew. In many parts of this State last winter our quail were compelled to go it alone—that is, the birds, owing to the scarcity of food were compelled to separate, each bird taking care of itself, or a limited number going together. This spring cock birds seemed to be calling their Bob White everywhere, and we are getting reports of birds from many directions. We are so impressed with this additional evidence that we propose to introduce a section in the new law that we

hope to have passed this coming winter, permitting the trapping of quail at certain times for the purpose of separating a covey to increase the chances of propagation. I will send you a copy of the proposed bill before long, and hope you will find space to publish same in full. We are of opinion that the great majority of those who violate the game law, do it, not because they are vicious, but rather because of thoughtlessness, or because it is the custom to do so in the community in which they may reside.

We desire to take the whole State and, I might say, the whole community of people who hunt game and who feel well disposed toward game and bird protection, no matter where they may reside, into partnership in this matter, and have enacted a law that is fair and just to the people, as well as one that will give protection to our birds. We want to protect all our birds for the good they do while living, and the game bird, for the additional good, that cannot be expressed in words or figures, derived by a day afield with the gun. We want the people to understand the law before it is passed, and to have as many as possible in each community join with us in seeing it is obeyed after it is passed.

JOSEPH KALBFUS,

Secretary of the Game Commission.

In Vermont.

SHELDON JUNCTION, Sept. 26.—*Editor Forest and Stream:* In spite of the extremely cold and long, dreary winter of 1903 and 1904, the ruffed grouse wintered well, for they are very plentiful here in northwestern Vermont this season. While the coveys are not large, they are numerous.

Woodcock are very scarce, a few scattering birds are occasionally found in the grouse covers.

Gray squirrels should soon be abundant, as there is a great nut crop, both beechnuts and butternuts.

We have noticed quite a number of deer signs, but no so many as in former years; and we have every reason to believe that they are being shot out of season by a class of fellows who are wondering about the woods with magazine rifles, and almost daily we hear of their being run by foxhounds. Evidently, the game wardens are not taking as much interest in enforcing the laws as they did in Commissioner Titcomb's time. Then it was a question of game and fish protection, now it seems to largely be a question of politics.

There is a feeling among the largest farmers in this vicinity to have the open season on deer closed for at least five years; they look on deer as ornamental and not destructive to crops. It is only a few grumblers and a few pot-hunters that are anxious to "kill something" that make complaints about these beautiful animals being destructive to grain and other crops.

The other day our setter started out from a small clump of pines a rare kind of fox. It was either a cross or a black fox. At this season of the year, when they are a little distance away, they look nearly alike. I, however, believe that when it is caught it will prove to be a "black."

During the past two weeks the weather has either been very cold or extremely wet.

During a trip along the north shores of Lake Erie recently, we were informed by the old duck-shooters there that the northern ducks were coming in a full month earlier than usual, which means a cold autumn and an early winter.

STANSTEAD.

Rhode Island's Restricted Variety.

PROVIDENCE, R. I., Sept. 25.—*Editor Forest and Stream:* In regard to the outlook for hunting in Rhode Island this year, we have a close season on quail, partridge and woodcock, and so our hunting will be limited to shore birds and wildfowl shooting. There has been a fair abundance of the former, while the season for the latter has not commenced as yet. Reports are that there are a goodly number of partridges this year; quail not so abundant, owing to the severe storms of last year, and it is a little bit early for woodcock flight. Very few pairs of these birds now remain to breed with us, and we have to rely for our supply upon the migratory birds from the north. Migration usually sets in about the first of October and lasts for three or four weeks.

JOHN H. FLANAGAN.

Secret.

The Loaded Gun in the House.

BEARING a woman in a critical condition from a gunshot wound, Edward Morrison's naphtha launch raced in a gale across Jamaica Bay, early yesterday morning, while a doctor worked over her. Several times the frail craft was in danger of swamping and had to be bailed. The woman was Mrs. John Wiesbrod, of 128 Woodbine street, Brooklyn, who was accidentally shot in the breast. The accident occurred at the summer home of Edward Morrison, on Black Hall Island, near the Rockaway Inlet. Mrs. Wiesbrod was asleep shortly after midnight yesterday when the slamming of a door by a gust of wind threw a shotgun from a rack in an adjoining room. The weapon was discharged, and the full load of shot tore through a thin frame partition, lodging in the woman's side.—*New York Times.*

An Exposition of Game Laws.

THE current number of the *Game Laws in Brief* is dated July. It contains the game laws of every State and Province from Newfoundland to New Mexico. The provisions are given plainly, and completely, so that with the *Brief* in his pocket the shooter may know precisely what the law is as to season, number, license, export, and all other details.

Hints on Deer Shooting.

THERE is not a finer animal to shoot than a white-tail buck weighing 200 pounds or more, when in the short blue coat, with a pair of pink, freshly peeled antlers surmounting his graceful head. The satisfaction in hunting and bagging such a deer, especially if a good, clean, creditable shot has been made, is of lasting duration. Aside from the actual pleasures of still-hunting, shooting on a pond or watching a favorable ground where deer are likely to be seen early in the morning and toward sundown, the sportsman, if he kills one under these conditions, is well repaid for patience and perseverance in other ways.

In the first place, he obtains a beautiful trophy in the shape of the buck's head when mounted; secondly, a soft, handsome skin that may be hung on the wall, used as a rug or made into gloves that will prove a comfort when hunting in cold weather; and thirdly, he supplies himself with a delicious game meat, none of which need or should be wasted.

Various opinions are held as to which is the most noble, stately member of the deer family, and, in fact, every hunter of this branch of big game has his own special favorite. Here is one who considers a rugged, lordly bull moose the king of all deer, the goal for his hunting ambitions, while again many experienced hunters maintain that a fine blacktail is unsurpassed.

An eminent writer on big-game shooting affirms the wapiti deserves first place, and there are others who will travel to wild remote regions in order to hunt the caribou. And so we find a multitude differing widely in their opinions.

The following, however, includes only the whitetail, or Virginia deer, those whose habitat is in the Adirondack Mountains. As everyone knows the range of this deer covers an enormous area, and that in different localities they vary both in size and habits. The southern deer is much smaller than the majority of the northern and western animals, while in weight Maine bucks, as a general rule, are heavier than those of the Adirondacks, although there are always exceptions in both cases. In certain parts of the West the whitetail inhabits the low river bottoms and is more of a skulking bush deer, but where they are found in the woods or mountains this trait practically disappears, although they are always keen and on the alert. In some cases, if left undisturbed, they will become very tame, even old gray-faced bucks, and I remember seeing one evening in August three of these big fellows ravaging a side hill garden situated near well-populated summer camps that were within full sight of where the deer fed and people continually moving around; but they ate on unconcerned, unless someone came too close to their vicinity, when they would canter easily off into the woods and return again at a later hour.

Another instance of almost extraordinary tameness was that of a small doe, often seen along a certain stretch of a wood road, who became so accustomed to horses, wagons and people that she paid practically no heed to them, and would stand browsing by the roadside only a few yards distant while a party of onlookers in a wagon stopped to admire her.

How deer contrive to live through an Adirondack winter is a puzzling question. During seasons more severe than others many perish, hundreds, one might say; and the decisive proof is the scarcity the following spring and fall. The worst condition for killing them is a moist, deep snow without a heavy crust, just so light that it fails to hold them up. They break through and, unable to move, those at all weakened die miserably, while, no doubt, the larger, stronger deer under certain circumstances succumb to the same fate. As a general rule deer will not suffer severely if they are able to get around and obtain the little nourishment the woods offer them and, with a deep but flaky snow or a hard crust, they fare very well. Let the former conditions prevail, however, and they are in a bad way. I have known as many as twenty-four carcasses or remains of winter-killed deer to have been found within a comparatively small area, and myself have several times seen a pitiful bunch of hair with a few bleached bones that marked the spot where, perhaps, a fine buck or doe had perished. But, let us leave such sad results of bitter northern weather and return to a later, more favorable period, for the sportsman can judge for himself how the deer have wintered, by their scarcity or plenty.

In the spring the deer, in their long gray coats, do not appear as thin as they really are, but when during the latter part of May and June this old hair has fallen out and been replaced by the summer red coat, one can detect with little difficulty the poor and well conditioned animals. The horns of the bucks by May are usually just commencing to show; soft, stubby prongs, like those of a yearling. Around the middle of that month I once saw a buck with a pair of small knobs on his head, and when seven or eight weeks later I happened to come across him again, I knew it was the same animal from his size and the locality he inhabited, he had a fine, well developed set of antlers.

During the latter part of June, July and August deer work a great deal around the ponds and lakes, feeding on the succulent water plants and endeavoring to rid themselves of the tormenting insects. It is an amusing as well as a pretty sight to see a long-eared doe or velvet-horned buck leisurely swimming about, picking off juicy green lily-pads in the cool water on some warm summer day, thus cleverly escaping from the flies.

Their red coat at this season shows very plainly, especially in the open or on a pond, and they can be seen a long distance if the sun is in a favorable position; but

in the woods they are much harder to discern, and often an inexperienced, untrained eye will pass over a deer within close proximity.

When, during the forepart of September, they almost entirely leave off feeding around the water and, in fact, there is usually little food left by them, the summer coat is rapidly shed and the soft, beautiful fall blue coat donned. They are now even more difficult to see in the woods than before, melting into the background of gray tree trunks and old logs with perfect harmony. Too perfect, perhaps, on certain occasions when the hunter hears the bushes crack, and looks a moment too late as a fine buck bounds out of sight.

The bucks are in their prime condition from the middle of September to the same time in October. With exceptions all the does are fat and sleek at this season, many being just as watchful and wild as the bucks who, with bright newly peeled horns, excel in appearance their looks at any other time.

Very few deer may be found on the ponds after the hunting season opens, so only a small per cent. of those shot are killed in this manner. They move around through the woods much more than at an earlier period, feeding and remaining in the vicinity of clearings, especially if oats or any other grain is planted there, besides, frequenting knolls and mountains as a favorite ground. A good, though expensive way to help deer through a coming winter, one of the few feasible plans I have seen carried out with success besides felling saplings in hard weather for them to browse off, is to plant a field or clearing with potatoes, cow-peas, buckwheat or oats, and fence the former varieties around in rope. This is about the most servicable method to prevent them from eating the young shoots, and then when the grain or vegetables are well ripened take it down and allow the deer to feed at will. The nourishment they obtain from such a larder gives them an extra coating of fat for the winter, strengthens and invigorates those under-conditioned, and in every way is a decided benefit to withstand cold and starvation.

The rifle most popular at present with a great many of those who hunt in the north woods is the .30-30 caliber, and where they are found the soft-nose bullet is usually apparent in almost every case. Not so often, however, are they found in the hands of practiced sportsmen, who realize that a high power rifle is far from essential for shooting in this region where very long shots are practically impossible. Also, an extra amount of danger attaches itself to that element, considering the distance one of these bullets will travel. Out west, where the conditions are entirely different, it is undoubtedly an all around meritorious weapon, for most of the shots are at long ranges, so that high power velocity becomes a necessity, whereas in the Adirondacks it is not. And it always seemed to me that the credit of a shot should not be placed to the bullet but rather to accuracy and knowing the correct point to aim for. On the other hand, a running shot or stationary one of several hundred yards, usually, the prevailing condition out west, the best of game shots will not always be able to hit in the exact spot, and therefore require a bullet more deadly in its effects. But, where the ranges are comparatively short, say under one hundred yards, a solid old-fashioned lead bullet is quite sufficient for anyone knowing the rudiments of deer hunting in this locality. Certainly a good sportsman must feel better satisfied if he makes a clean creditable shot with one of these than bringing in a deer torn and mangled by a soft-nosed bullet.

The former makes a small, almost invisible hole where it penetrates, and a very little larger mark, should it come out on the opposite side. A useful and advantageous weapon for an experienced man, but not a novice, is a three-barreled gun, two-shot barrels with a rifle barrel underneath; a lever throws the plunger of the right-hand barrel on the latter and thus it may be manipulated with great ease and quickness. The .38-55 caliber is usually the size bore of the rifle, and with buckshot, fine shot and ball always ready it proves more than servicable on many occasions if one comes on a flock of partridges, or jumps a deer when buck-shot is very welcome, for nine times out of ten shooting at a running object in thick timber with a rifle even at close range would be a clean miss. To do well with this gun, the hunter must bear in mind the fact of drawing down rather fine on the object he is shooting at; and here lies the disadvantage for the novice, as in the moment of excitement he is liable to forget this necessity, take a full bead, fire, and, in all probability, lose the deer.

Shooting high is a common fault with many, especially beginners, for when thrown on their own resources, usually accompanied by a pounding heart as they draw up to aim, with a great majority the thought not to take too coarse a bead is forgotten and misses or unsatisfactory kills result.

Thus, the best remedy in the beginning for one not desiring to make these so-called "botches" from untrained nerves and lack of experience is to have a rifle sighted a little low in order that a full bead may be taken with safety. Express sights are good for the reason of their sharp, well-defined outlines, and where a rifle is properly sighted, that is, so the hunter can hold practically the same on a deer from forty to a hundred yards, they prove most favorable. A .38-40 caliber with these sights is a light, handy weapon for shooting in the woods, while a .40-65, although a trifle heavier to carry, is very effective in disposing of

a large deer that, even if struck in the right spot, would probably run farther with a bullet from the former than one from the latter. But here, as in the case of favorites in big-game shooting, the choice of a rifle is a matter of taste and judgment.

Perhaps it would not be out of place to spare a few words to an essential point connected with successful hunting, namely, a proper knowledge of where to hold on a deer, varying with the different angles he is standing at, and under various conditions, whether in the woods or in the open.

For instance, here is a deer standing in a clearing, no trees, brush or undergrowth to obstruct the full view of his outline; a broadside shot being the first presented, hold on the center of the shoulder, a little below what might be calculated as a middle line. A good plan told me by one of experience, is to draw up on the foreleg when taking aim, as it affords an admirable mark in determining the shoulder's center. Perhaps the deer now turns, heading away from the hunter's position and offering a quartering shot; a bullet placed anywhere in the side or behind the shoulder, provided it is not high, will rake forward and surely prove fatal.

Standing head on or facing the hunter, a deer's chest and neck look no wider than the edge of a knife blade and confines the bullet to narrow limits. However, if hit in either of these places, excepting a mere graze, the deer will be bagged with the credit of an especially good shot as well, provided the animal stood at a fairly long range.

A FAVORABLE RESORT FOR AN EVENING HUNT.

Undoubtedly one of the most difficult positions is when the deer stands head on, partly quartering. The point of the shoulder should be the mark, and only a bullseye will answer satisfactorily, for if the bullet strikes farther back, although mortally wounded, the deer will go a long distance before giving in, escape the hunter and cause him deep mortification. Missing amounts to very little compared with the after effects on a sportsman if he wounds and loses a deer, for he is far from what many misguided people consider him, namely, the essence of hard, unfeeling cruelty.

Shooting in the woods where deer invariably are partly obscured by brush, trees and fallen timber entails a good deal more difficulty in placing the bullet in the proper spot than when in the open with nothing to hide the outline. Often only the head and neck will be seen if one comes on a deer standing behind a brush-pile or windfall, and should be a fairly long distance off in the woods, it is no easy matter to make a successful neck shot. Again, nothing but the quarters of the animal may be visible from the hunter's position, and if such is the case, it is always better to wait until a more favorable stand is taken before firing. Even though the deer might be ready to run, in nearly every instance it is advisable to let it go rather than make a "botch" shot, unless it is an especially large buck, when the temptation could hardly be resisted.

Pond shooting under certain conditions is hard, while at other times it becomes comparatively easy, according to the weather, sun and wind. Should there be a breeze, causing the boat to have a rocking, unsteady motion, it is by no means an unusual occurrence to miss a deer clean at fifty yards. Otherwise, on a calm day and even going up with the wind, there is little motion and the conditions are therefore far less difficult. Numerous have been the downfalls of unsophisticated hunters who considered that a bullet need only hit a deer to kill it, and the result of such ideas is disastrous, for where one animal is properly shot and killed, scores are miserably wounded and lost.

A good plan to follow, when practicing at a target simply for the purpose of improving one's game shooting, is always to shoot off-hand if the distance is not over a hundred yards, thereby gaining steadiness and increased confidence. Seldom when still-hunting in the woods one has the opportunity of getting a rest of any kind, so it is better to be independent, and then, if the conditions are such that an advantageous rest may be taken, the benefit is all the greater. As regards to position when shooting, all old and experienced sportsmen advocate a natural upright posture, no humping, awkward crouch, but gripping either rifle or shotgun

firmly, especially with the left hand, which is held well forward on the barrels. Nowadays in the target practice of both Army and National Guard, the left hand is held very close to the right, and in some cases overlaps it; but, whereas, this is probably beneficial in the latter, in game shooting, the former undoubtedly is the best position and certainly the most convenient.

Various methods of deer hunting are practiced in the North Woods, although within recent years many of the old ways have been restricted by the law, and undoubtedly for the good in the case of hounding. Nevertheless it was exhilarating and pleasurable on a frosty autumn morning, when the mountains were a glory of red, yellow, and russet, to watch on some lake or pond, with eyes and ears strained for the first glimpse of the driven deer or voices of the hounds. If the mellow baying drew nearer, making one's heart beat fast with expectation, it was a thrilling sight to see a fine buck break from the woods bordering the shore and plunge into the water.

The chase that followed was the sport in which the pleasure lay, for when it came to the shooting, unless the sportsman allowed the animal to reach shore, taking a hard shot just before it disappeared from sight, there was little sport about the thing. In fact, it always seemed an unsatisfactory way of bagging a deer; and then the many instances of butchery ensuing from the practice was sufficient to turn many sportsmen against it.

Jacking was practically done away with when the open season was changed to September 1, but as much of the enjoyment lay in the fascination of floating on a wilderness lake with the dark, silent woods surrounding, and everything shrouded in the wonderful mystery of night, the same pleasure may be partaken of nowadays in July and August, armed only, however, with a jack-light.

In certain localities deer are hunted by stationing the sportsman on a runway, while another man or guide takes a circle through the woods in the vicinity, starting up a deer that perhaps may give the hunter a shot if it happens to go his way. But undoubtedly a large element of danger attaches to this method, and probably a number of fatal accidents have occurred from its practice.

Pond shooting is most enjoyable, but of course there is not much chance of killing deer in this manner by September. However, during the early part of the month, if one watches faithfully on some favorable lake or pond, he may pick up a small buck or a well-conditioned doe. It is a curious thing that but seldom or never are really large deer killed in this way, and it only goes to show how well big bucks can look after themselves. Sometimes during August it is not unusual to come on one feeding or swimming along the shore, but such an occurrence at a later period would be quite remarkable. Once while fishing on a secluded lake bordered by unbroken forest, we happened to round a point that hid a picturesque little bay from view, and here a pleasant sight met our eyes. Standing on a high grassy

bank shelving up to the woods from a narrow sand beach, was a handsome buck with head erect directly facing our position. His horns curved in symmetrical lines against the dark trees, and his broad, deep chest proved that he was an old-timer. But a short distance from him, knee-deep in the water, stood a sleek doe, broadside, her ears poked inquiringly forward as she looked at the buck, evidently having noticed his startled attitude. This was one of the few occasions that we chanced to surprise a large deer on a pond or lake in the daytime. As a general rule it is a hard matter to paddle up to deer on a sheet of water if they are at all wild or on the outlook for boats, and even with the conditions perfect, an approach of under a hundred yards becomes a difficult proposition; and the ensuing shot, if taken, is not by any means an easy one. However, there is some advantage in the fact that the outline of the animal usually can be seen clearly, unless it happens to stand behind a log or alder bushes or in the long grass of a marsh.

Peep sights are advantageous in the open or on a pond, but they become practically useless in the woods, on account of the various lights and shadows. Here, as in the practice of shooting offhand at a target, it is perhaps best to use open sights, purely from the same point of view, in that it makes one more confident and independent. The average rifle, however, generally does not have peep sights, and this is meant only to include three-barreled and others so equipped.

To spend the day watching on some woodland lake is very pleasant, especially should it culminate in bagging a good deer; and to illustrate better such an outing, perhaps it would be worth while to give a short account of a successful incident.

The weather should at least be clear in order to thoroughly enjoy hunting after this method; and in fact if it is cold, cloudy or wet, the chances of obtaining a shot are reduced more than ever; whereas sunshine and warmth are decidedly favorable. Supposing that the pond is surrounded by wild picturesque scenery with no sign of civilization to mar its seclusion and quietude, and also that deer are not few nor far between in the vicinity, we find this mellow September morning two hunters stationed on the watch point projecting from the shore about half-way down the pond. It commands a good view of nearly all the little bays and stretches of yellow marsh grass bordering the edge of the woods; the still reflections broken here and there by a light breath of wind, or by a widening circle where a second before a plump trout leaped out to seize a tempting fly. One of the hunters, with field-glass at hand, is keeping a sharp lookout, scanning the shores with his field-glass

and with his own keen sight, while the other perhaps enjoys a siesta as he sits in the sweet scented huckleberry bushes that grow over the point.

What pleasant meditations can be indulged in on such occasions, with the atmosphere of peaceful solitude acting like a restful balm to the mind and the worries of the outside world dispelled. From the timbered hill across the pond comes the wild scream of a hawk, and blue-jays call shrilly to one another in reply; a squirrel rattles noisily up the small pitch pine standing near-by; and now suddenly the watcher on the rocks leaves his position quietly, while the eyes of his companion fix themselves on a moving red spot which has appeared on a strip of marsh half a mile or so away.

Gently the guide boat is slipped out, and one of the men seats himself in the bow facing ahead, stepping carefully on the soft bed of hemlock boughs covering the bottom, for even at a long distance deer that are wild will, with their acute hearing, detect any strange noise and disappear before one is fairly started out after them.

Silently the boat moves up the pond; but in a few minutes glasses are brought to bear on the object, and after a moment's scrutiny they turn back, for a closer view reveals a thin, mule-eared old doe.

At noon the hunters go a short distance back in the woods and unload their pack basket of frying-pan, coffee-pot, and perhaps a fresh venison steak, building a small fire, over which the latter is soon sending up an appetizing aroma that greets their nostrils most fragrantly. Every now and then one of the two walks out to the pond and takes a good survey of the shore, in order that no deer may give them the slip while they are feeding the inner man. Thus after the relish of an outdoor repast and a taste of camp-fire, they return to the watch ground, hoping for better success during the afternoon.

Not until the sun is lowering in the west, and cool shadows are reflecting in the water, is anything seen. Then up the lake, where the last brilliant rays strike on the shore, bringing out every line and detail with clear distinctness, they perceive a deer partly hidden behind a fallen tree. For the fourth time the boat is pushed silently out, and with the powerful glare of the sun in their favor, they glide quickly toward the red object, walking slowly along in the water. As they draw nearer it proves to be a good sized deer, and a still closer inspection shows a pair of horns surmounting the head. At intervals the buck looks up uneasily, for undoubtedly he is a wild chap, as shown by a certain nervous, proud manner; but his keen nose fails to detect anything unusual, and the light of the sun hides the oncoming boat. Seventy-five yards or so off the hunter in the bow holds up his hand, and at the same instant as the other stops paddling, the buck throws back his head with a start, for now he can discern a blurred, dark object moving toward him in the path of sunshine. But the peep sight is on his shoulder before he can change his broadside position, and at the report he gives a springing bound into the air, whirls, and dashes into the woods. Both men listen intently to the sound of cracking bushes, followed by absolute silence, and then one whispers, "He's down," the other nodding in pleased assent, nevertheless knowing well that a deer in the hand is worth two in the bush. Pushing ashore at the spot where the buck disappeared, they find the trail and follow it with great caution. But there is no need of a second shot. Here he lies behind a moss-covered log, stone dead, a bullet hole through the center of his shoulder. This is a pleasant moment, and although the deer is not a 200-pounder, he is a fat, handsome three-year-old, with slim velvet horns; and the clean shot the hunter has made perhaps warms his heart most of all.

In a certain region of the Adirondacks with which I am familiar, there existed a large clearing of eighty acres or more, surrounded on every side by thick woods, and not within the immediate vicinity of any human habitation. A good part of it was covered by clumps and thickets of birch, poplar, and beech saplings of forty years' growth, while some open stretches were under a meagre cultivation, usually planted with oats or buckwheat, for long since had the last blackened stumps crumbled away. It was an ideal hunting ground for both still-hunting or watching, as there were quantities of feed suited to a deer's palate, and after a favorable winter a number of animals were always to be found in and around it. Undoubtedly there are clearings like to this one in various parts of the North Woods offering the same conditions, and where by careful hunting one would obtain just as good results.

On the south side of the cleared land mentioned, a strip of saplings separated a large field, bordering on the woods, from the main clearing, and also a smaller one adjoining the former, both being invisible from each other. When the long, gray shadows had commenced to fall, and the glow of the western sky was growing fainter, a big buck was liable to step forth from the dark seclusion of the woods, where he had probably been quietly lurking for an hour or more, and cause the watcher in the distant blind to grip his rifle and get under control a momentary attack of buck fever. The gray outlines of a deer's body melting into the equally neutral color of the earth, makes him practically invisible at a hundred yards if it is twilight or early morning, and therefore at half this distance to place the bullet in a killing spot is far from easy. As the forward sight is chalked, in order that it will show more clearly, the chance of shooting high is increased, unless the rifle shoots a little low, as it should under such conditions, for even an old hand becomes liable to graze or break a deer's back in a poor light. There are times when one of these large bucks will take a notion to come out early in the afternoon, and still more often, as every hunter knows, they will not show themselves at all, only those deep, heifer-like tracks one runs across sometimes, betray the owner's presence.

Still-hunting on old log roads, trails or carries are the only ways this mode of hunting can be pursued successfully during the earlier part of the season. In November it is a different consideration when a soft snow muffles any sound and one can travel through the woods very silently; but before this, to hunt quietly where a twig cracks at each step, logs have to be clambered over, one has really more to do watching his feet than keeping

a sharp look out for deer. Perhaps on a stormy or rainy day by good luck a deer might be come upon unawares, but the chances are very slight of ever doing so. On the other hand, where a comparatively open path or road is hunted, especially if after a shower, and also if a wind is blowing, one becomes pretty sure of seeing deer with careful hunting.

Even on a bright, quiet afternoon, and toward sundown, considering that deer are plentiful in the neighborhood, the hunter may obtain a shot and be well rewarded should he do so, as the conditions require an extra amount of caution. Moccasins, with or without rubbers, are a good all-around outfit for the feet, and one not used to the former putting on the latter over them makes walking much less tiresome. The woods almost everywhere are cut up with log roads, tote roads, trails and carries, so it is therefore the best plan to confine

A 246-POUND BUCK.

still-hunting to such places and not try the unbroken forest, provided any measure of success is anticipated.

Seeing deer in the woods, unless they chance to stand out in plain view, is something that must be cultivated and taught by experience. Often only an ear, leg, horn, or small portion of the body will be visible, and it is for such objects the eye must search. The keen sight of some of the natives in this region is remarkable, as is their ability to follow up a wounded deer. A trail that will be almost invisible to many unless they stoop and examine the ground closely, moving very slowly, one of these men will follow at a rapid walk.

This method of hunting is undoubtedly one of the most pleasant, and when autumn frosts have colored the leaves in rich, varied hues, the woods, if anything, be-

THREE VENERABLE HUNTERS.

come a more constant source of delight. With those sweet, nut-like odors of fall in one's nostrils, and the fact that each cautious step may bring a deer in sight, adds a sensation of anticipation and free enjoyment experienced by all followers of the game trail.

Nevertheless, every mode of hunting, barring pot-hunters' ways and wiles, has its own intrinsic merits and pleasures, so it is somewhat amusing to read in recent able works on these topics the harsh criticism all methods of shooting receive, except those suited to the author's personal taste. It is very well for the expert still-hunter, who has had both time and opportunity to learn and study the rudiments of that art, to hold up his hands in horror at the thought of killing a deer by any simpler means, such as shooting in a clearing or watching a runway, but what difference does it make to the deer, provided he is properly shot and killed? Certainly to place the muzzle of a rifle practically against the animal's body, as was often the case in hounding or crusting, now prohibited by law, was always shunned by sportsmen, as any brutality will ever be detested; but to condemn

other methods of hunting except following a deer by stealth, is without reason or foundation.

Nowadays, as the limits on all kinds of game shooting draw narrower, one appreciates and enjoys more every bit of fur or feather brought to bag, and to him who cares especially for deer hunting, the staunch old Adirondacks, striving bravely to cling to their wild, virgin solitude, proves a near-by source of unfailing pleasure, offering woodland areas where one of America's noblest game animals still lingers. PAULINA BRANDRETH.

Duck Shooting in Australia.

Our party consisted of three old hands in one trap and three young larrikins in the other. We left Outram at 9 o'clock on Friday morning. The weather was somewhat threatening, but it kept fine all the way up to the Sutton, where we camped. A rabbit had a queer little tent here, made up in a corner of the old hut at the Sutton. I had rather a long yarn with him. He was evidently an educated man. He seemed to have had a university education, and had traveled in different parts of the world. His father had been an officer in India; it was quite a treat to speak to a man who took such an intelligent interest in things in general. It was queer to see the high class of books he read, stuffed away in a little tent affair, covered over with sacks. A good many people would call it a dog's hole. One had to crawl into it.

We started off next morning in good time, the gentlemanly rabbit helping us to pack. The roads were in better order than at any time I have ever seen them, especially up to Deep Stream. On the mountain itself there was a strong cold wind blowing, with misty sleet, which made things exceedingly unpleasant. Half-way over the mountain the party in the other trap were somewhat unfortunate in breaking one of their swingle-trees. We had to make a rough one out of a piece of firewood we were carrying, fastening this in the center with some fencing wire, and attaching the traces at the ends in the best way we could. I say we, my part of it was to hold the reins till they got the job done. However, we pushed on, and got down into the Upper Taieri Flat about half past twelve, and forded the river above the big lagoon a little later. We camped by the rocks just this side of the Green Swamp, our party putting the horses on one side of the fence and the other party putting theirs on the other side, hoping thus to keep the horses from straying. Nearly all of the party, after having lunch, went up to the flat to dig mimis, while I stayed back to put up the small tent. There were any number of ducks flying about, a good few geese and an enormous quantity of swans. We were in a good part (in fact, the best) of the flat. There was any amount of water in the lagoon, and being first in this place, there was a lagoon for each member of the party (six in all). We had high hopes for the morning. During the evening it was somewhat unpleasant to notice that the lagoon that runs up from the river between the fence and the rocks was rising rather rapidly to our camp.

Next morning, about half-past two, the old hand of the party became restless, and started talking away like a Chinaman, although neither of the other two gave him any encouragement, as they were both enjoying a pretty good sleep. However, his continued efforts in the Chinaman direction had their effect at last, and one of the party became more wakeful. All hands were turned out about half-past four, although there was no possibility of doing any shooting for two hours. However, after having a hasty breakfast, we were all dragged through the swamp, those without gum boots or fishing trousers having a bad time of it, as there was a heavy frost on. Owing to the lagoon and the Deep Creek being somewhat higher than we expected, it took us a good deal longer than we thought it would to reach our mimis. I trudged on in the dark behind one who I thought was the "old hand." After following him about half a mile, I heard him give a satisfied grunt, and put down his trappings by his mimi; then I knew I had been following the wrong man, and had to find my way back. By the time I had the canvas decoys blown up and attached by cords on a good long line the day was breaking, and the ducks were beginning to come in. The "old hand" soon began to make good practice, bringing down right and left in first-class style in no time, and before long we had the start of a good bag, though I was shooting poorly. However, things slackened off somewhat during the day, and although there seemed to be such an enormous quantity of ducks during the eve of the first, it turned out on the whole to be rather a poor day. I had the good fortune to bring down three geese the first morning, the "old hand" getting one, the other members of the party on that day got none. Swans there were in plenty; in fact, never more so; but we did not bother with them at all. Ducks of all sorts were coming in—paradise, grays, spoonbills and teal—there was plenty of variety. Unfortunately, the water kept on rising, and during that day it rose about 9 inches, the wood decoys and the natural ones having to be shifted every now and then. There was a cold, bitter wind, and occasionally sleeting showers coming down all day, and we were all glad to leave our mimis much earlier than we would have done if the day had been finer. Counting up the scores that night, the blacksmith had made a good bag by himself on the top of the lagoon (about forty-four), the old hand about twenty-two and myself fourteen. The others, having no decoys, had not done nearly so well—about twenty between the three of them.

Next day the water was still rising, being about 3 feet off our tent door. We shifted some of the goods out of our tent, but as we thought the water would go down now, we did not bother to shift the tent, there being little time so early in the morning. The ducks were flying even better than the first day, although we did not do quite so well. Total for three men, 107 ducks for two days. When we got back to camp we found that the water had come right up into our tent. We had to shift it on to higher ground among the tussocks, nearly all the cut tussocks and the tent being wet; the bedding being at the head of the tent was luckily for us, dry. We now thought it was time to

see what the river was like, as regards the Ford. The lagoon that we had come over by the rocks to our camp, was now too high to cross, even in gum boots. Artie went down to the crossing, but could see no signs of the gravel slopes that lead down to the river proper. They were all covered with water, and the water was still rising. It was obvious we could not get out of the flat for a day or two, unless we went out in another direction. The following day, two or three had a try at the shooting, but the ducks were now pretty well driven out of the flat. The "old hand" and I started for the top of the flat, where Mr. C. D. Smith was camping. The "old hand" took a try in the Black Gorge leading to the north, while I went over to Mr. Smith's camp, which was situated near the mouth of the Gorge, which comes from a more southerly direction, down which the Deep Creek flows, all muddy, owing to the sluicing done in the claim much higher up. Mr. Smith told us that we could get out at the head of the flat on the Blackball road, and that it was twelve miles by this road to Linburn station, and that we could get to Kokonga in time for those who wished to catch the train. We started about 9 A. M.; however, he must have under-estimated the distance, for we never got there till hours after the train had left, and it was 7 o'clock before we reached Hyde. From where we had camped, along the Blackball road, and through Patearoa, was too big a drive for the horses in one day. Two of us came in by the train, and the rest went on to Middlemarch, intending to stop there for that night. Altogether, except for the cold wind and the flood, it was a most enjoyable trip, and the drive through Patearoa was especially enjoyable, the weather being simply perfect.

When I took back instructions as to how to get out of the flat, via Linburn, our party seemed quite hopeful, but they talked on me a good deal as to the estimate of the time it would take to reach Hyde. We did not start at 7 o'clock, as advised, but we got away at half-past nine. We found we could not get out of the flat, (being so heavily loaded as we were), at anything above a walking pace. For myself, I enjoyed the drive immensely; it was such a perfect day. When we got to the river at Patearoa, they looked very doubtful at it, and I had to wade across it in my fishing trousers, before they would tackle it. I found when I got about the middle of the river, that I had all I wanted, and in fact, if I had not had a strong staff, I would not have managed it. Even then, they did not feel very confident about it, for they loosed one of the horses from the trap and tried it that way first. I then saw that it is a simpler matter for a man to cross a river on horseback. The horse has a tremendous weight above the water, while a man by the time he is up to the waist, has very little weight to put against the stream. Then too, the horse's legs are comparatively thin, while a man with waders on, creates a good deal of disturbance in the water.

As regards the size of shot. I had most success with No. 5. I had No. 5 in the right barrel, and No. 4 in the left. I got my geese each time with the right barrel, but failed to score with the left.

There were two or three little things in regard to the camping-out that struck me. The first is that instead of having the tucker box lid (the tucker box is a great institution) to open in the ordinary manner on the top, in such a way that you cannot get into it, on account of the blankets, etc., being packed on top of it, the idea is to have the lid to open backwards and downwards, (baker's cart style), having two or three shelves in it. This is very convenient when camping on the roadside. When you put up your tent, this box can be lifted down, and set inside the tent, and the lid lying on the bottom of the floor, makes a fairly handy table. Of course, the idea could be extended by setting up the box about eighteen inches above the ground, and have the lid rest on another two legs, the space underneath the box could be utilized for keeping the fire-wood dry, and so on.

Another notion was to take up some large bags of cheese cloth. The game can be laid out in these singly on the ground, in a shady spot, and there is not the slightest fear of flies bothering them. Another notion was to lay out about fifteen yards of calico at night, so as to catch all the frost there is; then when coming away, to wrap up your game in this, two by two. I found my tent fly, which I folded early in the morning, was still frozen together after traveling a day and a half, and by all appearances will keep so for a week. This would help the game while traveling.

Another thing I noticed, that instead of cutting the bread with a knife with jam on it, or with tinned fish, or perhaps flavoring it with candle grease occasionally (as is often done by those who seem to think that "camping it" is "hogging it"), a good idea is to have a quantity of the bread made into sandwiches, and put in a tin box, like biscuits. This keeps things nice and clean.

Re the tent. The one I took was a 6 by 8 (calico), and although it seemed to me quite big enough, the others were grumbling that it was on the small side. It is fitted up with rings sewn all around the lower edge, and can thus be pegged down tightly to the ground. It not only helps to keep the tent steadier in wind, but also prevents draughts coming in round the edge. There is a fly for it, so one need have no fear of the wet coming in, and there is a square fly that one could use on an extra ridge pole, and upright in front of the tent, either for hanging game in, or for keeping the tucker box and having lunch, without disturbing the bedding.

Next to the tucker box in our estimation, comes the fire box. This is an ordinary oil drum, with an opening at bottom and cross wires to stand the billy on; as the billy can be boiled with a tenth of the fuel, it will be seen that this is a big item, when on a trip in a treeless region like Central Otago. The oil-drum is wired on to the axle of trap when traveling. Don't forget a bottle of kerosene, to kindle the fire on a wet morning in a swamp almost discourages the oldest hand.

ARTHUR MCCARTHY.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

Southern Shooting.

HOTEL MECKLENBURG, Chase City, Va., Sept. 22.—Here I am, over in Virginia, and a little out of my North Carolina beat, but yet very much at home among these dear Virginians, who, by the way, are very largely North Carolinians. This bit of a letter is to be a sort of chat about sporting matters in the two States, and I am sure will interest not a few FOREST AND STREAM readers.

First of all, about the partridges in North Carolina. The "crop" is a very large one, and there is a surprising number of double broods. June was very dry and simply perfect for the first brood, and these birds are big fellows, while the youngsters, locally known as "squealers," are tiny as yet. The shooting season does not begin in most of the counties until Nov. 1, and when it comes it will find some of the late broods not fully grown. More peas have been planted this year than ever before, and the farmers are very generous toward the birds in not gathering the peas too closely. I make bold to say that this cornfield pea is the best food for partridges on earth. They relish it, they thrive upon it, and I really believe it increases the size of the birds. It is planted after the wheat is cut, and thus gives a double crop to the farmer.

The Audubon law has been very closely enforced in North Carolina, this year, and certainly Secretary Gilbert Pearson has every reason to felicitate himself upon the character and earnestness of the work. From the sea to the mountains the good news comes of what the enforcement of the law has done. The shore birds are breeding again, and Chief Game Warden John W. Upchurch, who has a wide territory under his supervision, tells me that the "rookeries" of the tern and other birds on the beaches are again becoming somewhat populous. The arrest of the men who hunt ducks by night on the North Carolina sounds has contributed a great deal to break up the abominable practice of "fire-lighting," which at one time threatened to drive away or destroy the ducks, brant and geese. The fact is that a lot of the people who went into this fire-lighting business were very desperate fellows, and it required stern treatment to put an end to their work.

The Audubon Society has had some amusing experiences in the matter of making arrests. The very funniest of all these was the case of a negro who in August captured and killed a mother 'possum and her six youngsters, cooked the whole lot, and had just finished eating them when the warden swooped down upon him. It cost him a pretty penny to get out of the scrape, and if he had not put up the money he would have been sent to the roads for a term of service. The season for 'possums does not open until Nov. 1.

As to the killing of partridges, the negroes and pot-hunters and a few countrymen have given most of the trouble in the matter of enforcing the law, which some of them seem to think infringed upon their rights; but it can truly be said that sentiment in favor of the partridge has developed more largely in the past two years among the North Carolina farmers than ever before. Virginians here tell me they think the birds are better cared for in North Carolina than they are here.

There is to be an extension of club shooting on the North Carolina sounds, and at least four new clubs, composed of Northern people, will build club houses in that section. Another thing which is of interest to sportsmen is the lease for a long term of years of the Atlantic & N. C. Railway by R. S. Howland, of Providence, R. I., and Asheville, N. C. He tells me he intends to develop Morehead City and Beaufort, two coast towns, a couple of miles apart, as winter resorts. Beyond any question, there are no finer places on the Atlantic coast between Florida and the north for winter fishing, and I do not know of any places where the summer and autumn fishing, particularly for Spanish mackerel and bluefish, is finer. The stretch of salt-water sounds is vast, the country is threaded with rivers with broad estuaries, and with deep creeks, with fresh-water lakes here and there, and in fact, the whole region is a hunters' paradise. Newbern will also be made an important center for sportsmen who enjoy the charming winter climate of eastern North Carolina, which has just enough coolness in it to give it zest. My prediction is that this development is going to interest many sportsmen in the North.

It will be remembered that the writer was at Pinehurst in March and told of Mr. Tufts' extensive experiment in breeding partridges there. The news is that the birds have done very well indeed, among them being almost three thousand which were brought in from Kansas. These Kansas birds are considerably darker than the North Carolina partridges, as has already been mentioned.

The number of Northern men who have kennels and shooting preserves in North Carolina is increasing all the time. Some of these people get control of shooting privileges on private lands around their places, by paying taxes on such lands. Some persons tell me that this is not the best plan, but insist that the best way is to let the guides arrange the matter, unless one can lease all the territory for a radius of miles, not missing any farms; their argument being that if any farmers are skipped they become very sour toward sportsmen, saying that the tax is not paid on their land, but is paid on their neighbors', and that they do not care for anybody to come upon their places. While the law in North Carolina in most counties makes it a trespass to hunt upon the lands of another without permission, yet farmers in the majority of cases are courteous about the matter. Of course, there are some gruff ones, and I know some who will not allow even their own neighbors to hunt on their lands. Such men are naturally execrated by their neighbors who are sportsmen.

The fox hunting is going to be good this season. In North Carolina foxes are found all the way from the coast to the mountains, and very nearly all are gray, the red fox being really a rarity. Over here in Virginia the red foxes are as plentiful as or perhaps more so, than the gray ones. Old hunters tell me that there is more real sport in chasing a gray fox than a

red, for the reason that the gray is apt to take a more tortuous course in his run, while the red, perhaps more daring or more confident of his powers, will steer a very straight course for many miles.

Over here at Chase City, Col. W. T. Hughes at the Hotel Mecklenburg has just installed a notably good pack of hounds, and to these will be added some from North Carolina. For example, Sidney Cooper is going to bring over his pack from Henderson, N. C. I was very much impressed by what a hunter said about the deer in this section. His remark was that he wished every deer was dead; that they interfered so much with the dogs in the chase of the foxes. It was quite a disparaging remark to make about such noble game as the deer, but it must be remembered that this man is a fox hunter and nothing else. It seems singular that deer should be so numerous in this rather thickly settled section of Virginia, but such is the case. The country is very fine for hunting either deer or foxes, with just enough roll to it to give zest to the chase. The fact is that here, as in North Carolina, you get the actual fox, and don't have to bother with dragging a dummy and then chasing nothing. The Virginians are like North Carolinians—they want the real thing when they go after it, and they smile at a lot of the sporting news which they read.

Cover is good in this section for partridges, and I find a good supply of the vetch, known as the partridge pea, of which they are so fond. This place is but a little ways from North Carolina and roads radiate in every direction. It is to be made quite a winter resort for sportsmen. There really is no reason why as good sport of a dozen kinds should not be had in both States. There is a club on the Roanoke River near here, where two thousand partridges, brought over the border from North Carolina, were turned loose last spring. This was really in violation of the North Carolina law. I asked how it was managed, and was told the birds were caught in traps and nets in North Carolina and brought in wagons to the grounds of the club, and there turned loose.

Good shots among the country people are increasing in number all the while, and some of the best city sportsmen are put to it to hold up their end when they go out in the fields with not a few of their country friends. Good guns and ammunition are responsible for a great deal of this, and the farmer who ten years ago never thought of shooting on the wing, is now able to make a fine record, to have birds on his table and often to sell not a few. The partridge is always salable, and the demand for these birds North is simply astonishing. If you go in a restaurant in this part of the country a partridge on toast will cost you just a quarter of a dollar, and he is cooked just right, too. What would he cost up North? The hotels and swell clubs there are clamorous for birds, so as to get them in cold storage, and they encourage pot-hunting and all that sort of thing, through local men, wherever they can. A gentleman from Hillsboro, N. C., tells me that the law is evaded there as to shipment of partridges in a rather curious way. He says the birds are handed to employees of the railway and carried by the latter to the State line, and then turned over to somebody. Birds may be sent out of Virginia in the same way, but it is very certain that the shipment has been immensely curtailed in both States by the Audubon law. The express companies declare that no birds are going out with their knowledge, and they submit gladly to the inspection of all packages by wardens. In North Carolina there will be many new game wardens this autumn, and they will have their hands full, no doubt, to keep people from evading the law.

A little later in the year I expect to go in the "sound country" of North Carolina and to send to FOREST AND STREAM some news notes from that watery world.

The reports which will come in this fall of the success of the breeding of pheasants will be awaited with interest. They have been turned loose in some localities, but it is very hard to induce a lot of people to join in preserving them. Negroes, who are born pot-hunters, and who will usually shoot anything that runs or flies, are especially troublesome in all these matters. They have an utter contempt for game laws of all kinds. There are very few negroes in the country who do not own one dog, a half-starved cur or mongrel of some kind, as a general thing. These dogs range far and near, and the number of partridge eggs they consume is certainly large. Not many people have taken this matter into consideration; but it is a fact, nevertheless, and one to be reckoned with. One thing must be said, however, and that is that the number of negroes in the country is diminishing quite rapidly. They are going to towns or saw mills, and thousands of them are drifting north, never to return in all probability. It must not be thought that there are not any white pot-hunters, for there are such, all of course being sneaks, who kill birds on the sly in any sort of way, and dispose of them in the same manner.

I have been much interested in reading in FOREST AND STREAM about the "barking" of squirrels. I have seen several men do this with the old-fashioned long-barreled rifles. I have seen both fox and gray squirrels killed in this way, and the skin uncut. At the crack of the rifle if the bullet entered the upper edge of the limb, just under the neck or head, they popped up in the air and then fell to the ground, stone dead. I have skinned and examined some of these squirrels, and found that the flesh was bloodshot just at the point where the bullet passed underneath. I have seen squirrels thus shot by a man sixty-two years old, some being on the very highest pines and oaks. He did not think it unusual, and said his father "shot close up to seventy years."

FRED A. OLDS.

The Danvis Stories.

WYMORE, Kansas.—One of the family circle said the other day: "I like the Danvis stories better every day; Uncle Lisher and Aunt Jerushy, Sam and Hulda, Joseph and Antwine, and even Granther Hill and old Drive, are all still alive. All but poor Peltier; and I expect Sam is cutting up his corn and getting ready to go down to the East Slang after ducks now." A. D. McCANDLESS.

From Ducks to Polish Girls.

Editor *Forest and Stream*:

When my copy of the paper came to-day, I looked to see whether it had been finally determined yet whether the ducks can smell or not. I think they can; if they cannot, there is nothing the matter with their sight. They can see all right, as witness the care they take in keeping away from our blinds. There is one bird that I cannot be convinced can smell—the wild turkey. I have crawled up almost on top of him when he was feeding, with the wind blowing right from me to him. I had learned enough to keep out of his sight; there was no danger of his smelling me. I would not crawl up on a duck that way, though, and would not try to do it.

Often, when helping to build a blind for the benefit of the ducks, I think of one I helped to build away back in the sixties, down in Virginia, and I have to laugh at it. The blind was meant to conceal a battery of 6-inch guns for the benefit of the Confederates, not ducks. In theory the Confederates were supposed to march up a road and run on top of this blind, then fall over it. In practice they did nothing of the kind, but halting their own battery a mile away, began to throw shells at us. They threw them too high, and while they were getting the range, we got our battery out of that, then put it where it should have been put in the first place. This was Easton's battery of the regular artillery. He had lost the most of his men in the fighting before Richmond, and we volunteer infantry took his battery to see if we could work it. We could, and kept it in action all day at the battle of Malvern Hill, refusing to be relieved when the other batteries were. We kept a six-mule team busy all day hauling up ammunition for us, and when the fuss was all over, General Fitz John Porter sent his staff officer to compliment us. "Tell the General," our lieutenant (a regular himself) told him, "that this battery has been kept in action to-day by a lot of volunteers."

"Well, they had no business being in the volunteers," the staff officer replied. Then turning to us, he said: "You men should go to the regulars." More than one of us took his advice and afterward went to the regulars.

I got a letter a few days ago from a man who had lately been on an outing with two small boys, his son and

nephew. While in camp the boys went after berries and found poison ivy—or what we call poison ivy—the botanists tell us that it is not an ivy at all. He had a terrible time getting his boys to a doctor. He did not need any doctor had he known, as he does now, that he had at least one antidote right in camp. Bathing the poisoned place in a strong solution of salt and water would have stopped all smarting right away. The cure would come later. Or bicarbonate of soda used instead of salt would have done still better. I have used the bicarbonate of soda dry, and have found it to work all right. Another one is what we call the lobelia (I do not know its botanical name; we boys used to call it wild tobacco, for the leaves when chewed have a slight taste of tobacco). The leaves are boiled and the poisoned place bathed in the water. Plantain leaves, which may be found almost anywhere, are another cure. Bruise the leaves, then bind them on.

Some persons seem to be immune to ivy poison. It has never hurt me, and I destroy it wherever I find it. I use care when doing it, taking the least possible risk; but I have had men tell me that the ivy would poison them if they only passed where it grew and did not touch it. That, I think, is a notion, though. The poison is in a gum on the outside of the leaf. It must touch the skin to poison it.

Another weed I never fail to destroy when I find it growing, unless there is too much of it, is what farmers call jimson weed. Jamestown weed, or stronium, is its proper name. A small green pear-shaped fruit grows on it in the late summer. Two of these, if eaten, will kill a child as surely as a dose of arsenic would. Very few of our boys would try to eat them; the children of for-cigners often do. I know of several cases where this pear has killed Polish children; and in one case I took some of these pears from two small boys just in time to prevent their killing themselves with them.

Children try to eat curious things at times. Last summer I found a party of half-grown Polish girls in among some sumach bushes, trying to eat the hard, brown berries that grow on them. I told the girls that these were poison. I know, of course, that they contain nothing except tannin, but they were never meant to be eaten.

CABIA BLANCO.

Ducks on Currituck Sound.

CURRITUCK, Sept. 19.—*Editor Forest and Stream*: Just as last year at this time, blue-winged teal are here in countless thousands. With the exception of last season, we have never seen anything like it before, and we old hunters do not understand it. I remember once, on August 9, 1870, shooting ten blue-wings and sixteen sprigs; but since that time until last season, the blue-wings seemed to be scarce. Unfortunately, our season to shoot over decoys does not open until November 1, and the blue-wings all leave about October 15. We do not see them in the spring.

Sprigs and black ducks began to arrive this season on August 20, ten days sooner than last season. There are also thousands of them here, which is unusual. Our yellow-leg shooting has been the best we have had in many years, and they are still abundant. I was out three days last week, and bagged 135, 122 and 70 respectively.

Strange to say, I have not seen a golden plover this season, and there are very few black-breasts, while last season I shot large numbers of them—more than in many years before.

Those who expect to visit Currituck for duck shooting may feel sure of good bags. Our waters are filled with an abundance of the best duck food, and the ducks are being protected. I may say to the young duck shooters along the line, whether "ducks do smell," that when shooting black ducks, teal, sprigs or any of the marsh ducks, they will kill more birds if they place their decoys so the ducks will not have to come to them directly to the leeward. We always try at Currituck to select a point pointing east or west, if the wind is north or south; and pointing north or south if the wind is east or west. This gives the shooter a broadside shot, which enables him to kill his birds dead and helps him to double them. If there is a gentleman who wants to know for certain if "ducks can smell," and will visit me at Currituck, I'll prove it to him. I except canvas-backs, redheads, blackheads, and all ducks that dive for their food.

A Well Larded 'Coon.

From the Log of Camp Nessmuk.

THE fishing was rather good that summer we had the experience with the 'coon. Emerson and George had been up Kettle Creek on their famous first day's fish, when they were in duty bound to "catch more fish, more pounds, more inches, than any other two in camp," for, forsooth, was not this the burden of their boast from year's end to year's end; and was it not distinctly bad form, in their eyes, to slip up Kettle Creek before they had exercised their loudly proclaimed prerogative? Howbeit, they did not always make good, but on this occasion they succeeded. The other came straying in, leg-weary, but with trout in their creels to be duly admired. Is this not half the pleasure in catching 'em? The supper dole, cooked as only "Pap" can cook trout, had been most generous befitting a lucky first day, and there remained a goodly portion for the morrow's breakfast. These were placed in the "spring-house," a bucket sunk deep in the icy waters of an old "tail race" that emptied into the near-by 'Sock, hard by the camp, for cold storage.

Supper over, Pap gathered up his tackle; dish-washing at Camp Nessmuk never falls to the lot of a recognized fisherman, and announced to Pard, his inseparable shadow when on fishing bent, that they would have a try at the big ones in the cold water at the mouth of Dry Run, some half mile up the 'Sock, which they had located earlier in the day on one of their many trips up and down the "big creek." No matter what his luck, Pap consistently refused the lure of the smaller streams, sticking closer than a brother to his beloved 'Sock. Near about nine by the camp clock, they returned; Pap in the lead, with that strong, steady lope of his, Pard on a dog-trot some half dozen yards behind, as usual. Truly a picturesque pair as they step out of the gloom into the light of the great "Nessmuk fire" blazing before the tent. Pap, long, lank and tireless, in homely gray; Pard short, wiry, and full of nervous energy, with trousers stuffed into gaudy golf stockings gartered above the knees with bits of fishing-line, a broad rattlesnake belt encircling his waist, a loosely knotted bandana around his throat, a pair of glasses perched above a brown Vandike beard, and the whole topped with a big white sombrero, the crown wound round and round with a tangled confusion of leaders and flies.

"Any luck?" en chorus from those gathered round the fire.

"Of course. What do you take us for?" from Pap.

"Aren't we the recognized meat purveyors of Camp Nessmuk?" by Pard, who seldom or never catches any when fishing with Pap.

Then Pap modestly produces three goodly 'Sock trout, and tells how they would not take the fly, though he tried 'em on one and all, from his favorite coachman to a white-miller; but fisherman means resourcefulman, as I have elsewhere recorded, and Pap, who was the duly constituted meat-getter as well as mentor of Camp Nessmuk, was prepared for just such contingencies, and forthwith baited a 3-hook leader with worms aplenty, leading it so as to sink it to the bottom. In the deepening twilight this usually proved effective, when all else failed with the big fellows which lay moodily in the cold waters at the mouths of the smaller streams, awaiting

the uncertain June rise upon which to ascend the colder stream for the torrid dog days.

His catch—beauties above 12 inches, were added to the bunch in the "spring-house."

As we view it, one of the drawbacks to Pap's mentorship of camp, is an irresistible impulse to rise betimes in the morning. Just as one is becoming comfortably adjusted to the inequalities of his balsamy bed, Pap is heard wrestling with the ground-built stove, and by six o'clock it is, "Breakfast—everybody wash."

George always considers this last clause a personal matter, somewhat in the nature of a reflection, as he tardily and sleepily appears upon the scene.

Upon this particular Tuesday morning, when Pap repaired to the spring-house for the breakfast trout, he found an empty bucket. We were rudely awakened with the startling intelligence that someone or something had gone through our larder and lifted the trout.

We had eggs for breakfast.

But 'twas a mystery who got those trout.

It was now up to us to hustle for meat. Eight hollow, hungry souls cannot be sustained on air, even though it be filled with the life-giving ozone, about which we brag so freely and know so little. We just must have trout; everybody to the streams. By supper-getting time we had reassembled with trout in the pan and a breakfast in sight.

That evening it was long after dark when Pap, Pard, and Fred returned from the late fishing up at the mouth of Dry Run with four large ones—a 14-incher among them.

Next morning when Pap began his breakfast preparations, he discovered the lid off the bucket, and the four large trout missing; the others were, apparently, intact. The mystery deepened.

During the day, Pap discovered a track in the muddy bank of the tail race, just below the spring house. An examination disclosed that it was a 'coon track. It needed no Sherlock Holmes to put two and two together to surmise the culprit.

That night we prepared for our nocturnal visitor. It was near midnight when Pap, who always slept with an ear and an eye to the front, heard a scratching down at the spring-house. He reconnoitered, but the 'coon, scenting danger, beat a hasty retreat down the race. Some time later he returned and again awakened Pap, who roused Pard, and they hastily planned their campaign. Pap got the gun—a small Flobert—and Pard armed himself with the hatchet, thinking of bears, no doubt. As they were sallying forth, I awoke, grasped the situation, and picked up the lantern, dimly burning. The 'coon was busy, but when Pap blazed away at him, he cut for the brush lickety-split. In the morning the trout were none the less for the adventure.

A 'coon is nothing if not persistent, and he does dearly love fish. I've seen veritable paths worn along the edge of the water where the 'coons nightly raced up and down on fishing bent. They likely did not disdain the half-grown tadpoles that fairly made black the shallows along shore. We were hardly in bed the following night until he was back at his old trick, and one and all jumped out of bed to enjoy the fun. Pard picked up a club, I took the lantern, and the assault was on. But the 'coon was too intent on the work in hand to pay the slightest attention to what we might be up to, and Pard boldly approached and got in several vicious licks—mostly on the

bucket—before his 'coonship beat even a reluctant retreat, and then only so far as the bushes on the opposite bank.

Some time during the night he returned, and, baffled in getting at the trout, clawed the lid off the lard bucket and generously helped himself to Peter's prime leaf-lard. That he had put his foot into it, was quite evident next morning, when someone remarked, "Wherever he is, he's a well larded 'coon, anyhow."

WILLIAM WALTERS CHAMPION.

Fish and Fishing.

Some of the Food of Fishes.

AMONG the visiting American anglers whom I had the pleasure of meeting in Quebec last week, were Dr. Robert T. Morris, of New York, the talented author of "Hopkins' Pond and Other Stories," and his friend, Mr. Glenn Ford McKinney. When one calls to mind the pleasures afforded by the reading in *FOREST AND STREAM*, of the majority of the sketches comprising the doctor's attractive little book, it is scarcely possible to avoid a feeling of regret that our old friend should be so tied down by professional engagements as to be unable to contribute as frequently as he did a decade or more ago, to the columns of contemporary sporting literature, from his rich and varied store of experiences, and from the result of his careful observations in forest, lake and stream.

When the doctor and his friend called in on me last week, they were just out of the woods, having spent some time in fishing and exploring upon the limits of the Tourilli Fish and Game Club. The doctor and Mr. McKinney are both very much interested in the stocking of barren waters with fish and in the subject of food for fishes. Where some of the best trout fishing is now to be had on the Tourilli tract, Dr. Morris found that the lakes were well supplied with ephemera. There are some lakes, notably Lake Crapaud, on the Tourilli limits, which a few years ago contained no fish at all, and which have been most successfully stocked by the club. Not so many years ago a number of small trout were planted in Lake Crapaud. The water was so thick with minute insect life at the time, that it was scarcely possible to lift a glass of it, even out of the middle of the lake, that was fit to drink. Microscopic entomostraca, such as the daphnia and cyclops, literally swarmed in it. As trout multiplied, which they did very rapidly, the water was speedily cleared of much of this minute insect life, notwithstanding the almost miraculous rapidity with which the various entomostraca increase. There is little doubt, judging from a recent reference to some notes which I made during my last visit to Lake Crapaud, that though the entire water of the lake is not now thick with the entomostraca as it was before there were trout in it, yet there is still much of this food for the fish on the mud and on the foliage of the water plants, as well as of ephemera. And the trout have so well thriven upon it that specimens over six pounds in weight have been taken out of the lake, and they are certainly some of the most brilliantly colored fish that can be seen anywhere.

There are still many opportunities for successful fish-cultural operations on portions of the Tourilli tract, as

in almost every part of Northern Quebec, for rich in their fish supply as are most of the rivers and lakes to be here met with, it not infrequently happens that the explorer stumbles upon new waters which Dame Nature has apparently overlooked entirely, when so lavishly distributing her wealth of fish life in Canadian waters. It may be that no waterfowl, such as those which were responsible, perhaps, for the original planting of trout spawn in neighboring lakes, have dropped the fertilized eggs of *fontinalis* from either their mouths or legs, into these comparatively barren waters, and as they are shut off from any direct communication with other waters containing trout, they are still uninvaded by the monsters of the brook.

Dr. Morris and Mr. McKinney explored many waters teeming with fish food, but without the game fish which might subsist upon it; and the result of their observations is likely to lead in the near future to the planting of useful varieties where they do not now exist at all. There are some waters on this tract which are apparently well adapted for the support of ouananiche, and if these can be procured they will probably be introduced into them, after the planting of either ciscoes, smelt or suckers as additional food for them. I am inclined to think that it might be better to try the Atlantic salmon itself in these waters. It would undoubtedly become somewhat dwarfed from inability to descend to salt water, but would probably, for at least some generations to come, retain a greater bulk and a more gamy nature than the ouananiche into which it would undoubtedly degenerate in future ages. And except for the wicked designs of evil men, there is no good reason why the St. Anne River, which flows through a good portion of the Tourilli tract, should not be made again what it once was—a good salmon river. Fishways would have, of course, to be erected at the different milldams, and saw-mill men would have to be made to observe the law prohibiting the dropping of sawdust or other mill refuse into the river; and, necessarily, the stream would have to be carefully guarded from its mouth up.

E. T. D. CHAMBERS.

Belgrade and Some Digression.

Editor *Forest and Stream*:

"The best black bass fishing in the world" was on the letter heads of the paper furnished by the proprietor of the Belgrade, located on the Belgrade chain of lakes in the State of Maine. We were somewhat skeptical when we first saw the statement and wrote for a bill of particulars, but Mr. Hill answered and said he meant small-mouth black bass, and that you really couldn't expect to get the best black bass fishing without the presence of *M. dolomieu*; so we decided to give Belgrade a chance to "make good" and incidentally find out if the hotel was as comfortable as it looked in the picture.

Thus in the early part of July two anglers left the cares of home and business for what proved to be one of the most enjoyable and well spent of vacations. Suffice it to say, that the verdict is that Belgrade deserves the praise meted out by the letter head, and that we found everything at the hotel, except closet room—but that is another story.

Fishing at Belgrade, by the intervention of the bait-man, the boat and the guide, is reduced to the simple formula of sitting in a chair and playing a bass. That is all you are actually required to do, and if ever that becomes too tiresome, the guide will play the fish for you while you simply hold down the chair. All this is brought about by the fact that the bait-man always has bait, and plenty of it, the boat is the best of its kind, and the guide, after you are seated in your chair, rows the boat, selects the fishing ground, drops the anchor, takes up your rod, baits the hook, makes the cast, nets the fish, takes it off the hook, and then repeats; as a matter of fact, if you need exercise, don't go to Belgrade, for in angling there you can't get more than I have outlined, except at the risk of becoming unpopular with the guides; they need the exercise themselves, and besides, if they are not allowed to work off a little of their latent energy, they become more talkative than the village barber. They told us, however, that in mid-August the bass are not all over the lake, as in July, but are found in deeper water, and in certain places only. August, then, is the time to fish, for the guide can find his exercise at the killick and the oars, and perhaps at times waive the unwritten law and allow you to bait your own hook and make a cast.

Angling at Belgrade is precisely like business, a daily occupation; however, in business you go to work because you have to, and hate to miss a day because it costs money; in angling on Grand Lake you start out every morning because you want to and cannot resist, and you dislike to miss a day because it would cost you peace of mind, and the thought that the other fellow might come in at night with a big one.

We knew we were 100 per cent. daft over fishing when we left New York, but we found a hotel full of people just like us, and even worse, and we were 150 per cent. daft after the first day's fishing. We met men who had been there six weeks and even longer without missing even a part of a day on the lakes; it takes good fishing and plenty of it to hold thus even an Izaak Walton.

The fishing regulations afford a fine example of wise and timely legislation, and we are undoubtedly indebted to this legislation for the really great fishing that the lakes afford, and the fact that the small-mouth bass is certainly on the increase.

A number of years ago when market fishermen on these lakes were shipping bass to market by the barrel, and each angler was doing what most of his brothers did—catching large quantities of bass and bringing the catch ashore and then abandoning the fish at the boat house, so that it became necessary to employ a man whose sole duty it was to clear out the boats and remove the dead fish, a law was passed which abruptly stopped the nefarious work of destruction and saved the fishing. The feeders of the lakes were all made closed streams and the retained catch per person was limited to ten fish per day, all fish beyond that number to be returned to the water; The

result now is that practically no fish are brought in, and all fish are returned to the water alive except the few that are eaten on shore at lunch hour; the guides use disgorgers, and very few fish die by the hook. Natives and visiting anglers all seem to appreciate what the law has done and is doing, and take a genuine pride in the enforcement.

The angling community at Belgrade was made up of numerous types; many seek the pleasures of the gentle art, but each one seeketh in his own peculiar way and holdeth views which are in many cases peculiarly his own. The great line of demarkation is that which divides the fly-fisherman and the bait-fisherman. From this we deduce modified types and the first classification would be as follows:

- (1) Fly-fisherman.
- (2) Fly-fisherman and bait-fisherman.
- (3) Bait-fisherman.
- (4) Plain pluggers.

In the first class we find men who never fish with anything but the fly, and who are the real simon-pure, unadulterated fly-fishermen, to whom the word bait is positively distasteful, like a dose of rhubarb and soda to the child. The gentlemen who have reached this high estate can climb no higher in piscatorial altitudes; they can breathe no more rarified atmosphere; they stand on the summit and look down with pity on their brethren who are groping below. However, he who uses a fly is not always of Class 1, for, like the summer man, who later returns to the ribbon counter, the angler who flirts a fly in your presence may not be able to cast, or he may have a box of frail blood worms in his coat-tail pocket, and backslide when beyond your observation.

The other three classes speak for themselves, and are more easily identified.

We met many anglers at Belgrade, but few of the first class; most of the gentlemen whose peculiarities were observed formed part of a large flotilla of bait-fishermen and plain pluggers, who daily cast and plugged in the waters of Grand Lake with the dainty frog, the delicate shiner, the elusive grasshopper and often with the timid night-walker.

First and foremost, there is an impression of an Episcopal clergyman, High Church, but a pluggers. Every morning he could well say, like Peter, "I go a-fishing." He was continually on the move unless the fish were biting particularly well, and he never stayed longer than five minutes in one place, except under very favorable conditions. Being anxious to get the bait down to the bottom without waste of time, he used a heavy sinker. Somehow, the hook and sinker not only found the bottom quickly, but very often seemed to cling to the resting place with malice aforethought. When these periods of unwonted tenacity arrived, he vainly attempted to pull everything into the boat or (as the guides put it), "tried to land the State of Maine."

I can see him now—in action at such a crisis—violently pulling and hauling, switching the water into foam, working his arms up and down as rapidly as the piston-rod in an engine, and finally desisting from sheer exhaustion. I can see the guide take the line gently in his hand over the side of the boat, hold it taut, thrum it a few times, and release the tortured hook without commotion, and peace would again preside over the house; like some young medical men, the bishop had no patience.

There was also a professional man who caught few fish, but never missed a strike. He always gave the fish plenty of time to gorge, the time allowance varying with the bait. His schedule ran about as follows: Ten minutes for an ordinary worm, fifteen for a frog and twenty-five for a minnow. It really paid to fish in his neighborhood and see him in action, complacently paying out yard after yard of line from the reel, while the bass rambled and rambled, and then to see with what patience he lit his pipe and smoked away the minutes while the fish swallowed and gorged and gorged and swallowed. At last, when the accepted time had arrived, he would "soak it to 'em" in villainous glee, and unless the leader had become digested or the line gave way, the victim was bound to come to boat with the hook firmly imbedded deep in the interior of the tail. The surgical operations that took place in the doctor's boat, with the guide as the surgeon, the disgorgers as the sole instrument and the doctor as the impatient clinic, certainly rivalled anything in the realm of surgery—appendicitis wasn't in it at all. Little did you know, good doctor, that the "doctor's time" became a byword among us, and after missing several strikes, we would vow to give the "doctor's time" on the next bite.

One man in the community fished entirely with a fly, but as a fly-caster he was far from a success; his guide agreed on that point after feeling the hook. He used the fly-rod in much the same manner as an angry parent; the atmosphere was always warm in the neighborhood of his boat, and the water roiled and foam-flecked. When the baby bass, who ranged along shore in the vicinity of his casts, saw or felt the combined agitation produced on the water by the swaying boat and seething line, they tarried not—it was a case of action equal to reaction, and in the opposite direction.

He wore out many flies, but not by rises—fast traveling over the surface and rapid maneuvering through space were the annihilating factors. He also lost many flies, taken by heavy fish. One such tragedy came within my observation. Being much interested in calisthenics, we were watching our friend, as, with regularity of action and rhythmic sweep he whipped the water. Suddenly, while attempting to jerk the flies from the water, they appeared to be victims of stoppage in transit, the rod doubled and then sprang back; the fly and leader had parted. We were then within talking distance, and this conversation took place: "Lost him! That was a fine rise! Fully three pounds! Tore the fly right off." We expressed sympathy, and as our boat slowly pulled along over the memorable spot where the rise occurred, Bradley quietly slipped his hand over into the shallow water and picked up the fly, which had caught on a rock.

When our genial friend told that night about the three-pounder that ravenously rose to and ruthlessly

made off with the Parmachenee-belle, I again sympathized, but told not, for I knew that such delusions were the sustaining factors in his angling, and that without them he could not find sufficient moral support to keep on with the daily round.

Then there was a man who caught the five-pounder and immediately became "chesty" and had to give away all his headgear. He was a good man and a gentleman until he caught that fish; but during the rest of his sojourn he conversed only with celebrities, ate lunch alone with his guide, wore a Tuxedo to dinner and cut down the waiter's allowance because that dignity failed to rise to the occasion and fan the requisite amount of oxygen. After he left us his guide thought it about time to come out into the lime-light and tell how he hooked and landed the fish while his client was peacefully slumbering on shore.

Two men in a boat anchored near us one afternoon. The fish were biting well, but it was plain that the gentlemen had not fished before. They had been lucky in their shopping, however, and had evidently kept away from Vesey street and department stores, for their tackle was all right. Gracious! how they angled! The more portly of the two was able to make a cast of six feet, measuring at right angles from the vest line, while his comrade fairly reveled in casts of ten feet, provided his friend was quiet and the guide ducked at the proper moment. After the hooks were in the water, it became a set-line festivity, and the only fish captured hooked itself, and then signalled to be pulled in. Oh, the promising young frogs that gave up their lives in vain; all because our friends had yet to learn that to hook a bass you must "soak him."

Eddie B., one of the meekest of all the non-strenuous guides and the holder of the village reputation for patience, took out two anglers for their first day's fishing. That night Eddie's patrons reported that he had used violent language and that they had dispensed with his services.

We looked up Eddie, and found him in the drug store buying anti-stiff, and a patent medicine strongly recommended by the druggist and known as "Old Doctor Ripley's Resurgent Re-invigorator or Imbricated Indian Tonic." Between gasps and in a weak voice, Eddie submitted the following brief: "I only swore once, and then I cussed real solid. I took 'em to the ledges (two miles) and they fished three minutes, and then we went to Pinkham's Cove (four miles); they did not like it there because the bog was unhealthy; then we fished to Chutes Island (five miles), and on the way over, the man asked me if I had ever rowed a boat much before. We went ashore, and I built a fire and was tryin' out the pork, when the woman saw a spider, and we had to move away. I put out the fire, put things in the boat, and she said: 'Let's go over to that pine grove just over there' (just over there was three miles). Well, I cooked dinner, and he said it would be better to bring a cold lunch next time and eat in the boat; then I rowed 'em to White Horse Shoals (four miles) and to Rome Shoals (two miles). When we got to Rome they were sure Mr. Fairchild and Dr. Paxton were catching big ones down by the Point, so I rowed there, and then they wanted to go to Upper Hoyt's Island (six miles). Well, I'd just started rowin', when the woman said, 'Now, Mr. B., it's getting late, let's see how fast you can row.' Then, then," said Eddie, "I just cut out and I cussed. I'd been savin' up for a spell, and I let out pretty solid."

It is perhaps needless to say that the lover of nature was present at Belgrade, for all anglers are as a rule nature lovers, and given to draining the cup of individual communion.

Love affects persons in many ways, but usually the tongue remains passive while the heart and soul wax energetic. One man among us combined the attributes of both Cyrano de Bergerac and Christian, and his soul and vocal chords seemed to work in close harmony with nature at all times. That man could "see things" in nature that the old dame herself never dreamed she possessed. His after luncheon nature fests will always be remembered.

KENNETH FOWLER.

Snappers Near New York.

PRINCE'S BAY, Staten Island, N. Y., Sept. 21.—Good bluefishing can be had now at Prince's Bay, Staten Island. This may sound large and leaning to a fish story, but it's a fact. Do not get your sailboat and trolling lines and squids ready; you will not need them. Go and stand on the dock and you can catch all you care for, and some to give away. Leave your clumsy old fish-pole at home, and use a light bait-rod. Trout tackle is just the thing, with a hook just large enough to hold a small spearing. The fish run from six inches to a foot in length, and are gamy to the last, giving a light outfit all it can do. Now and then a mackerel comes along and puts up a stiff argument. Two or three were caught from the dock this morning, and they are not to be despised. But the large "snappers," as the young bluefish are called, give the most sport. The bait can be procured at several places near-by. If anyone wants a little fun with light tackle, now is the time. Besides giving the sport, the fish are good to eat; they are as good a pan fish as can be caught.

Another 100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

103

No. 102 was of an American who fished up a miniature British cannon in the Niagara river. Here is one of an Englishman who fished up an American rifle in British waters. Mr. William Hearder, of Plymouth, writes to the London Fishing Gazette: "One of our fishermen on Saturday, while hauling a spiller which he had laid for conger, was surprised to see the butt of a rifle come up in his face. The hook caught in the trigger guard; it was an old breechloader of the Remington type, and although the butt is rather worm-eaten and the barrel covered with crustacea and barnacles, the hammer and spring are perfect."

YACHTING

SPORT AND ADVERTISING.

We find in our English contemporary, *The Yachtsman*, the following terse and very interesting description of the America's Cup situation viewed from the English standpoint:

"The evident determination of Sir Thomas Lipton to challenge and race for the America Cup at any cost and at any sacrifice, compels us to adopt an attitude at once antagonistic both to him and to his methods. We do so with confidence, knowing that we speak for a large body of British yachtsmen—if not, indeed, for all—and feeling the responsibility of our duty to the public. To yachtsmen in a position to know the state of affairs, we can say nothing of which they are unaware—for them the America Cup was a sealed book after the contest of 1895; to those intimate with Sir Thomas Lipton and his personal affairs we can still say less; but to the public, which has but one meaning for the word 'sport,' and which, we consider, has largely been imposed upon as far as this matter is concerned, we would address ourselves.

"To avoid mincing matters, and to go at once to the root of the matter, let us say that we consider the America Cup, so far as Sir Thomas Lipton is concerned, to be from first to last a huge advertisement. Business men who know Sir Thomas Lipton's great capacity are aware that his advertising genius has raised him to his present position. The America Cup contest has undoubtedly been his *chef d'œuvre* in this particular line, and has, both directly and indirectly, brought him greater profit than any other effort he ever made. We think that an all too pliant press has already too long lime-lighted the show, and an all too simple public meekly stood by and watched the prostitution of its noblest sport. The all-devouring thirst for sport which can only find vent in such blossomings we cannot understand. Our home racing languishes for lack of support; but it is, at all events, the purest of our national sports, and would, therefore, be but a badly-placed hoarding. Sir Thomas Lipton's commercial field is America, so American must be the setting. But that concerns us little; if the Yankee is out-Yank'd, it is his own look out; we hold our brief for the British public who may not get near enough to hear the ring of the metal.

"Under such conditions it may readily be conceived that the result is quite immaterial, and to discuss the unfair conditions of the contest under any rule would be but a waste of words. We live by sport and we live for sport, and will always do our utmost to further it; but we will not further tolerate this now too transparent masquerading poster. Fortunately such sport is an exotie, but lest it should establish an overlap it is our sacred duty to luff it off the course—pass us who will.

"To those of us who know the inner workings of the past three races, it is little surprising that our principal yacht architects have washed their hands of the affair, and the hunt for a designer to undertake the work may prove as arduous as the search which discovered the Royal Ulster Y. C. as a backer for the first of the challenges. We are personally glad of it, as the designer's share in the proceedings was the only one we could conscientiously take an interest in. We have heard much of the influence of such 'sport' on the friendly relations of the two great Anglo-Saxon nations; but one blood flows on both sides of the Atlantic, and we know that the dignity of both would be sadly hurt if they thought for one moment that their friendly ties were secured by such cheap blandishments—we look to our bonds of friendship to be united by truer ties. We have not the slightest desire to interfere with business methods and enterprise; but we cannot sit by and see dragged into them the sport of which we are so justly proud."

On this side of the water we have long been very tired of the effort of a grocery syndicate, with goods to sell at retail, to advertise itself and its wares at the expense of our favorite sport, and it is remarkable that this view of the situation has not presented itself to the British press before; for no man in the world holds his sport so dear as does the Briton. Perhaps the truth has been realized in England, but *The Yachtsman* is the first paper with courage to give the facts. The situation is delicate, and one may touch upon it only with reluctance; but the time had come for the exposure of one of the cleverest advertising schemes ever perpetrated, a scheme which has produced results which probably could not have been secured through legitimate channels at anything like Sir Thomas's expenditures for his racing. No individual nor concern ever obtained so much free notice as has this aspirant to international honors in the realm of sport. Win or lose, it made no difference. Business boomed in either event. No man could help posing as a good sportsman when this very stand was the play that caught the public and filled the coffers.

Something in the line of *The Yachtsman's* remarks has found its way into print from time to time in this country; but the position of the Americans as the challenged party precluded, on the part of those having the defense of the Cup in charge, any official criticism of the motives of the challenger. Whatever may have been the feeling of the New York Yacht Club, nevertheless, so long as the challenge came from a club of recognized standing, the dictates of good taste, not less than those of good sportsmanship, forbade any questioning of the actual purpose of

the owner of the Shamrocks. No other course was open to the Cup defenders than to defend it. In defending it, no other assumption was permissible than that those who were competing for it were moved by the generous impulses and worthy ambitions which usually stimulate and give zest to the sport of yachting.

Now, however, since the challengers themselves have opened the discussion, and have rendered it possible to make known without violation of good taste the true feeling of American yachtsmen respecting the Lipton races, we may look for a frank expression of disgust at the whole monumental advertising scheme.

The rumored fourth challenge through an unknown organization has all the familiar appearance of another advertising campaign. There probably will be no fourth challenge from the quarter now under discussion; but no matter from what source a challenge may come, let the contests be kept absolutely free from any taint of commercialism.

Gold Challenge Cup Motor Boat Races.

Hudson River, September 22, 23, 24.

THE second series of races to be held this season for the American Power Boat Association Gold Challenge Cup, took place on the Hudson River, off the Columbia Y. C. house, on September 22, 23, 24.

The first series of races for the gold trophy took place earlier in the season, and there were but three starters in the event. Standard won the series easily, but her victory was not a great one, as the only other boat of any merit was Water Lily, and she was never dangerous.

The second series of races was a great success in every particular, both in point of management and in the number of starters. It may truthfully be said that these races are the only ones that have been given this season anywhere along the coast that really were of any importance. They have been the saving clause of the season, from the viewpoint of the racing power boat owner, and it is fortunate that the summer was brought to a close by such a gratifying series. Yachtsmen are now satisfied that the high speed power boat is no longer a myth, and with the changes and improvements that are bound to be made during the winter in the design and construction of hulls of power boats and their engines, some really good racing and consistent performances may be looked for next season.

The following tables give the particulars of the ten boats that started in the races:

Boat.	Club.	Owner.	Engine.
Shooting Star, Manhasset Bay, H. A. Lozier, Jr.			Lozier
Marcirene II., Cape May, J. W. Allison			Grant Ferris
Challenger, Audubon, Smith & Mabley			Smith & Mabley
Vingt-et-Un, Chippewa, W. S. Kilmer			Smith & Mabley
Mercedes, U. S. A., Rhode Island, H. L. Bowden			Mercedes
Macaroni, Atlantic, C. L. Tangeman			F. I. A. T.
Josephine, Jamaica Bay, A. J. Buschmann			Mahler & De Groot
Mercedes VI., American, W. K. Vanderbilt, Jr.			Mercedes
Flip, Hartford, C. D. Holmes			La Roach
Speedway, Columbia, C. L. Seabury			Speedway

	H. P.	W. L.	Rating.	Allow.
Speedway	64.45	39.3	72.84	0 19 20
Mercedes, U. S. A.	42.02	31.11	72.30	0 20 05
Challenger	119.44	39.6	83.35	allows.
Vingt-et-Un	59.72	30.10	79.55	0 10 17
Macaroni	40.33	31.11	68.10	0 26 55
Josephine	19.08	29.11	53.40	0 59 17
Mercedes VI.	39.52	39.9	65.70	0 31 12
Shooting Star	24.07	37.08	65.55	0 31 29
Flip	38.09	34.10	65.10	0 32 17
Marcirene II.	34.40	34.50	54.25	0 56 55

The allowance is figured for races over a 32 nautical mile course.

Thursday, September 22—First Race.

The first race of the series took place on Thursday. The day was cold, and the breeze blew directly down the river. The water was quite smooth. The boats had a head wind and a head tide on the first leg up the river, and a fair wind on the home leg, although they bucked a little tide for part of the distance.

The Race Committee was composed of Messrs. Fred. A. Hill, Manhasset Bay Y. C.; F. J. Stone, Columbia Y. C.; and H. De B. Parsons, American Y. C. The race was scheduled for 2 o'clock, but the start was delayed an hour in order to allow the upstream mark boat to be placed off Piermont. As a matter of fact, the launch was so slow in getting to her place that she was forced to anchor fully a knot short as she was overtaken by the racing boats.

The Race Committee adopted the admirable plan of sending the boats off in their handicap times, i. e., the starter receiving the largest allowance was first to start, being sent away as many minutes ahead of the scratch boat as that craft was forced to allow her. Thus Marcirene II. started 56m. 55s. in advance of Challenger, the scratch boat. Theoretically this would bring the boats pretty well together at the finish, the only time of interest for the spectators in a motor boat race, and as a matter of fact worked out fairly well.

The preparatory signal was fired at 3 o'clock from the dock in front of the Columbia Y. C., where the committee had taken up its position.

The boat receiving the most time was Josephine, and she was sent away first, handicapped 17s. Marcirene was next, 23s. after her signal. The third boat to start was Flip; she was 30s. behind. Shooting Star was next away, getting a rather better start, for she was handicapped but 7s. Mercedes VI. was 12s. after the gun, and Macaroni 17s.; Mercedes U. S. A., 9s.; Speedway, 20s.; Vingt-et-Un, 10s.; and Challenger, 2m. 9s. This latter

boat was disabled, and withdrew immediately after the start. She dropped a pin from her thrust bearing, and was unable to cover the course.

Mercedes VI. showed remarkable speed, and overtook the leaders very fast. She was leading long before the upstream mark had been reached. Mr. W. K. Vanderbilt, Jr., who was steering Mercedes VI., had difficulty in locating the outer mark, and had to stop his engine and make inquiries, losing some two or three minutes thereby. The times at the upstream mark follow:

Mercedes VI.	4 16 30	Mercedes, U. S. A.	4 27 05
Josephine	4 18 38	Speedway	4 27 14
Shooting Star	4 23 00	Vingt-et-Un	4 33 18
Macaroni	4 23 10	Flip	Not timed
Marcirene II.	4 26 00		

Mercedes VI. continued to get away from the fleet on the home leg, and finished an easy winner by 11m. over Macaroni. As the course was short, the Race Committee adjusted the times accordingly. The summary follows:

	Start.	Finish.	Elapsed.
Josephine	3 05 00	5 25 25	2 20 25
Marcirene II.	3 07 22	5 31 27	2 24 05
Flip	3 32 00	5 19 26	1 47 26
Shooting Star	3 32 48	5 13 07	1 40 19
Mercedes VI.	3 33 06	4 54 35	1 21 30
Macaroni	3 37 22	5 05 43	1 28 21
Mercedes, U. S. A.	3 44 12	5 08 54	1 24 42
Speedway	3 44 57	5 07 10	1 22 13
Vingt-et-Un	3 54 00	5 09 57	1 15 57
Challenger	4 04 17	Disabled.	

The standing in points follows: Mercedes VI., 10; Macaroni, 9; Speedway, 8; Mercedes, U. S. A., 7; Vingt-et-Un, 6; Shooting Star, 5; Flip, 4; Josephine, 2; Marcirene II., 1; Challenger disabled.

Mercedes VI. covered the 30 nautical miles in 1h. 21m. 30s. Vingt-et-Un did better, however; her time was 1h. 15m. 57s. Mercedes averaged 22.85 nautical miles over the course, and Vingt-et-Un averaged 23.70.

Mercedes VI. was designed and built by Mr. Robert Jacob at City Island. The design embodies a number of Mr. Vanderbilt's own ideas. Mercedes is 40ft. waterline, 3ft. 8in. breadth, and 7in. draft of hull. She is a lap streak boat, and planked with 3/8in. material. The 60 horse-power Mercedes motor develops only 39.52 horse-power. The total weight of the boat is in the neighborhood of 1,200 pounds. The deck openings are protected by aluminum covers.

Vingt-et-Un was designed by Mr. Clinton H. Crane, of Messrs. Tams, Lemoine & Crane. The boat has been a very consistent performer as motor boats go since she made her appearance. The figures for the world's record are under dispute, a number claiming the honor. Whether Vingt-et-Un holds the world's record over a 30-knot course or not is a question, but in any event she is very close to it.

Friday, September 24—Second Race.

The starters in the second race had an opportunity to test their weatherly qualities, and in this respect a number of the boats were found wanting. Vingt-et-Un distinguished herself by not only winning the race, but by making fast time over the course as well.

A strong S.E. breeze made the river lumpy, and off Yonkers the water was quite rough.

The preparatory signal was given at 2 o'clock. Josephine was the first boat to have started, but just before the starting gun her propeller caught in a mooring and was torn off. This put her out of the race, but the others got away in fair shape, with the exception of Challenger, which boat failed to materialize. Marcirene II., Flip, Shooting Star, Mercedes VI., Macaroni, Mercedes, U. S. A., Speedway, and Vingt-et-Un started in the order named.

When a few miles from the starting line, the hose connecting with the water jacket of Macaroni's motor got adrift, and she drifted around for the better part of an hour while the engine was allowed to cool.

Mercedes VI. took the lead before reaching the upstream mark, but Vingt-et-Un, coming fast, was close behind. The times at the mark follow: Mercedes VI., 3:40:39; Vingt-et-Un, 3:41:14; Marcirene II., 3:41:27; Speedway, 3:42:00; Flip, 3:42:25; Shooting Star, 3:42:26; Mercedes, U. S. A., 3:50:42.

The boats were now driving into a strong wind and sea, and solid water as well as spray was coming aboard continually. Mercedes VI. proved very wet, and she shipped so much water that it was necessary to stop the motor and bail her out to keep afloat. She was finally taken in tow and brought back to the club house. Speedway and Shooting Star both had an unpleasant time of it, and it was found to be wise to stop and pump out. While the other boats were trying to overcome the difficulties of rough water, Vingt-et-Un was driving along, making good speed and reasonably free from water below. She finished a winner by a good margin. Flip, the second boat to cross, showed up well, and was not bothered to any marked extent by the sea. The summary follows:

	Start.	Finish.	Elapsed.
Vingt-et-Un	2 54 00	4 21 03	1 27 03
Flip	2 32 00	4 47 59	2 15 59
Marcirene II.	2 07 22	4 59 20	2 51 58
Mercedes, U. S. A.	2 44 12	4 59 29	2 15 17
Speedway	2 44 57	5 14 38	2 29 41
Mercedes VI.	2 33 05	Did not finish.	
Shooting Star	2 32 48	Did not finish.	
Macaroni	2 37 22	Did not finish.	

The standing in points for the two days' racing follows: Vingt-et-Un II., 15; Speedway, 12; Mercedes, U. S. A., 11; Flip, 11; Mercedes VI., 10; Macaroni, 9; Marcirene II., 8; Shooting Star, 5; Josephine, 3; and Challenger, 0.

Vingt-et-Un covered the 32 nautical miles in 1h. 27m. 3s., averaging 22.055 knots an hour.

Saturday, September 24—Third Race.

The third race demonstrated that of the boats Vingt-et-Un was certainly the best sea boat and the most re-

liable of the lot. She won the third race and the Gold Challenge Cup.

None of the boats are intended for use in rough water, and the weather conditions for Saturday were more trying even than on the day previous. Macaroni caught fire during the race and was badly injured. Mr. William Wallace, a motor car and boat enthusiast, and Louis Stempfer, the machinist, had a narrow escape.

The boats were sent over the 32-knot course. Going up stream the starters had the strong S. wind astern and a head tide. Coming back they had a head wind and encountered the first of the flood.

The preparatory was fired at 2:30. Josephine's starting gun was heard 5m. later; she was handicapped 10s. Marcirene II. was next away; she was only 4s. late. The others crossed as named: Flip 9s.; Shooting Star, 2s.; Mercedes VI., 6m. 50s.; Macaroni, 15s.; Mercedes, U. S. A., 12s.; Speedway, 15s.; Vingt-et-Un, 12s.; and Challenger, 17s. Of the ten boats to start, only half the number finished.

Just after crossing the starting line, Shooting Star broke her clutch and was forced to withdraw. Mercedes VI. had trouble with her motor before the start, but managed to get away 5½m. after her gun. The engine ran fairly well until she reached a point off One Hundred and Fifty-first street, when it gave trouble again. She was taken in tow by the launch Miss Swift. Josephine and Challenger also got in trouble. They were so late in finishing that they were not timed.

When within a couple of miles of the upstream mark, Macaroni took fire. The boat was all ablaze amidships, and her two occupants had worked their way well forward and aft. Fortunately, the 15 gallons of gasoline in her tanks did not explode, and Messrs. Wallace and Stempfer were taken off the boat before the flames reached them. When Mr. Bowden, owner of Mercedes, U. S. A., saw Macaroni was afire, he immediately went to the rescue; after lending what assistance he could, he went on and finished the race.

The times at the outer mark follow: Speedway, 4:13:15; Flip, 4:15:35; Vingt-et-Un II., 4:16:30; Marcirene II., 4:17:40, and Mercedes, U. S. A., 4:22:40.

Vingt-et-Un made good weather of it on the run back, and won out easily. Speedway also did well, and finished second. Mercedes, U. S. A., was third. The summary:

	Hdcp.	Start.	Finish.	Elapsed.
Vingt-et-Un II.	3	24 00	4 54 24	1 30 24
Speedway	3	14 57	5 00 34	1 45 37
Mercedes, U. S. A.	3	14 12	5 09 15	1 55 03
Flip	3	02 00	5 14 26	2 12 26
Marcirene II.	2	37 22	5 34 17	2 56 55
Josephine	2	35 00	Did not finish.	
Mercedes VI.	3	03 05	Did not finish.	
Shooting Star	3	02 48	Did not finish.	
Macaroni	3	07 22	Did not finish.	
Challenger	3	34 17	Did not finish.	

Vingt-et-Un covered the 32-mile course in 1h. 30m. 24s., averaging 21.25 knots. Speedway went over the course in 1h. 45m. 37s.

The standing in points for the three days' racing follows: Vingt-et-Un II., 25; Speedway, 21; Mercedes, U. S. A., 19; Flip, 18; Marcirene II., 14; Mercedes VI., 10; Macaroni, 9; Shooting Star, 5; Josephine, 3, and Challenger, 0.

Mercedes VI., Mercedes, U. S. A., and Macaroni have been protested on their ratings. All will be remeasured.

Macaroni, the boat that caught fire, was designed by Messrs. Burgess & Packard for Mr. C. H. Tangeman, and built for the purpose of participating in the races for the Gold Challenge Cup. She was a mahogany boat, 31.1ft. on the waterline, and fitted with a F.I.A.T. motor. It is said that the boat caught fire through the breaking of the feed-pipe. This allowed the gasoline to run into the motor of the boat, where it ignited.

Atlantic Y. C.

Sea Gate, L. I.—Friday, Sept. 23.

SEVEN boats started in the fifth race for the Havens challenger cup, which was held over courses in Gravesend Bay on the afternoon of Sept. 23. The winner on corrected time was Lizana, smallest boat of the fleet. She sailed a grand race and succeeded in defeating Vivian II. 3m. 29s. for the 11-mile course. The Havens cup was offered this year by the rear-commodore of the Atlantic Y. C. It is open to boats in Classes M and N belonging to the Sea Gate organization, and must be won three times for permanent ownership. In the races held to date, Bobtail has two victories to her credit and Red Wing, Era and Lizana one each. J. B. O'Donohue, owner of Red Wing, has challenged for the trophy. It has not been decided whether the race will be held this season or not.

The boats in the last struggle for the trophy went three times over a triangular course, leaving all marks to port. The first leg from Sea Gate to a mark boat off Ulmer Park was a broad reach, and in the fine S. breeze blowing, ballooners were carried to port. Gybing at the mark the same sails were employed for another reach to the second mark off Fort Hamilton. The journey home was dead to windward. Era withdrew on the first round and Bobtail and Bagheera on the second, all of them being too far behind to stand any chance of victory.

Just before the finish of the race, which was a spectacular one, Red Wing lost her jib, as did Vivian II., a little later in similar manner. Vivian II. crossed the finish line 7s. ahead of Maydic and 13s. ahead of Red Wing. Lizana was the last of the survivors to end the race, but with a liberal allowance won out in handy manner. In competitions for the Havens cup all the starters race in one class on time allowance according to the new rule of rating adopted by the Sea Gate Club. The summary follows:

	Sloops—Classes M and Under—Start, 3:00.	Finish.	Elapsed.	Corrected.
Lizana, D. T. Wylie	4	58 08	1 58 08	1 42 45
Vivian II., S. C. Vernon	4	46 13	1 46 13	1 44 14
Red Wing, J. B. O'Donohue	4	46 26	1 46 26	1 44 18
Maydic, W. H. Childs	4	46 20	1 46 20	1 46 20
Bagheera, Hendon Chubb	4	Did not finish.		
Bobtail, E. F. Luckenbach	4	Did not finish.		
Era, E. H. M. Roehr	4	Did not finish.		

Saturday, Sept. 24.

The fall regatta of the club, the last regular scheduled event of the season of 1904, occurred on Saturday,

Sept. 24. Outside courses were sailed. Of the sixteen yachts to start all finished. The winners on corrected time were Red Wing, Bobtail, Lizana, Ogeemah and Beta. Trouble won the cup offered by Mr. Hendon Chubb for the first Atlantic Y. C. boat to finish in Class Q. Again Lizana distinguished herself by excellent work. Crossing the starting line 4m. 20s. after the gun for her class, she sailed through the entire fleet of smaller boats, beating out to Old Orchard Shoal Light and was the first to gybe around the mark for the spinnaker run home. She finished 5m. 46s. ahead of Ogeemah, second craft to end the journey.

Classes M and N went once out to the Southwest Spit buoy and return, a distance of 14 miles. It was a beat out and a run home. Red Wing and Vivian II. made a fine race of it, the fresh W. breeze being much to her liking. Bobtail led Bagheera by a good distance during the greater part of the race. The other starters went to Old Orchard Shoal Light and back, a distance of 12¼ miles.

The boats which worked up along the Staten Island shore by a series of short tacks had much the better of the argument. Bonito, Naiad and Smoke stood out into the bay more and made a poor showing in consequence. Trouble and Spots did better than usual, closely following Ogeemah at the finish of Class Q. Beta and Gamma, two of the Marine and Field Club new Class RR craft, sailed a plucky race in fresh conditions, the former winning out at the end by 2m. 23s. The Regatta Committee, which consisted of Messrs. Henry J. Gielow, Fred Vilmar and Bartow S. Weeks, was on board the tug Union. The starting line was to N.E. of Coney Island Point. The summaries follow:

	Sloops—Class M—Start, 11:15.	Finish.	Elapsed.	Corrected.
Red Wing, J. B. O'Donohue	1	49 05	2 34 05	2 33 54
Vivian II., S. E. Vernon	1	50 33	2 35 33	2 35 33
	Sloops—Class N—Start, 11:15.	Finish.	Elapsed.	Corrected.
Bobtail, E. F. Luckenbach	1	57 17	2 42 17	2 42 17

New York Y. C.

* Glen Cove, Long Island Sound—Tuesday, Sept. 20.

THE Regatta Committee of the New York Y. C. arranged a special race for the three 70-footers, Yankee, Rainbow and Virginia, on Tuesday, Sept. 20. A class was also provided for the three 36-footers, Spasm, Anotok and Mimosa III. Unfortunately, the wind was light from the N.E. all day.

Mr. William Gardner and Mr. Paul E. Stevenson assisted Mr. S. Nicholson Kane in the handling of the race. The Race Committee were on board Mr. R. A. C. Smith's steam yacht Privateer.

The start was made off Station No. 10, N. Y. Y. C., at Glen Cove. The course was 10 miles N.E. to a mark off Shippan Point, then 7½ miles W.S.W. to another mark, and then S. ½ W. 4 miles to the finish line.

The starting signal was given at 1:25. Rainbow was first away, on the starboard tack; Yankee crossed second, on the port tack, and Virginia was last, on the starboard tack.

The yachts were unable to finish within half an hour after sunset, so the race was called off. At this time Rainbow was considerably over a mile in the lead. The owners of the 30-footers withdrew on the first leg, as they saw it would be out of the question to cover the course within the time limit.

Friday, Sept. 23.

The six boats that were unable to finish the race sailed on Tuesday started in another contest on Friday. A class was also provided for raceabouts, and five of these craft came to the line. The winners were Rainbow, Mimosa III. and The Kid.

None of the regular Race Committee were on hand, so Captain Fred M. Hoyt very kindly consented to act. The race was splendidly managed in every particular.

The start was again made off Station No. 10, N. Y. Y. C., at Glen Cove. The wind was fresh from the S.W. The 70-footers were sent over a 21-mile triangle. The first leg was a spinnaker run of 4 miles to Parsonage Point, the second a broad reach of 7½ miles to Shippan Point, and the third a beat of 10 miles to the finish line off Mott's Point.

The preparatory was given at 2 o'clock. Mr. Harry Maxwell put Yankee over the line first. Virginia was next, with Mr. W. K. Vanderbilt at the wheel and, although Mr. Cornelius Vanderbilt was the last over with Rainbow, his boat, was berthed better than the other two. On the spinnaker run to the first mark Rainbow slipped into first place, and Virginia passed Yankee.

The times at the first mark were: Rainbow, 2:45:04; Virginia, 2:45:14; Yankee, 2:45:17. Balloon jib topsails were broken out for the reach to the second mark. Rainbow continued to draw away from the other two boats. Yankee and Virginia indulged in a luffing match, in which Virginia came off second best, and Yankee again took second place. At the second mark the times were: Rainbow, 3:26:10; Yankee, 3:27:15; Virginia, 3:28:30. Rainbow and Yankee stuck together on the beat home, while Virginia went off on her own hook. The race between Rainbow and Yankee was a very pretty one, and although the Maxwell craft was well handled, she was beaten 1m. 24s. by Rainbow.

The 36-footers and raceabouts covered an 11½-mile course. From the starting line they went to the Parsonage Point mark, thence to another mark anchored between Matinicock and Oak Points. This gave them a run, a reach and a beat.

The 36-footers started as named, Spasm, Mimosa III. and Anotok. The Brokaw craft took the lead on the run to the first mark and showed her two rivals the way

around until the windward work proved too much for her and Mimosa III. was enabled to take first place. Mimosa III. won by a comfortable margin, and Spasm was second.

In the raceabout class The Kid won and Cricket was second. A protest was filed by Cricket against The Kid for forcing the former about where she had the right of way. The summary:

	Class H—70ft. Sloops—Course 21½ Knots.	Finish.	Elapsed.	Corrected.
Yankee, J. Rogers Maxwell	2	11 28	4 43 34	2 32 06
Virginia, W. K. Vanderbilt, Jr.	2	11 59	4 47 48	2 35 49
Rainbow, Cornelius Vanderbilt	2	12 00	4 42 42	2 30 42
	Class M—36ft. Sloops—Start, 2:15—Course 11½ Knots.	Finish.	Elapsed.	Corrected.
Spasm, E. D. King	4	12 19	1 57 19	1 57 19
Mimosa III., Trenor L. Park	4	10 12	1 55 12	1 55 12
Anotok, W. G. Brokaw	4	15 03	2 00 03	2 00 03
	Class O—Raceabouts—Start, 2:20—Course, 11½ Knots.	Finish.	Elapsed.	Corrected.
Cricket, Howard Willets	4	29 54	2 09 54	2 09 54
Rana, J. Macy Willets	4	30 18	2 10 18	2 10 18
Hobo, Trenor L. Park	4	33 17	2 13 17	2 13 17
Busy Bee, R. T. Wainwright	4	33 25	2 13 25	2 13 25
The Kid, Oliver Harriman	4	29 29	2 09 29	2 09 29

Monday, Sept. 26.

The race, arranged for the 70-footers by the New York Y. C., on Monday, Sept. 26, brought out all three of the boats in commission. The contest was sailed in a light breeze, but a wind and rain squall that broke as the boats were finishing made matters lively for a time.

The Regatta Committee was on board the tow boat Unique, and the start was made off N. Y. Y. C. Station No. 10, at Glen Cove. The first mark was off Shippan Point, 10 miles from the starting line, thence 7½ miles to a mark off Parsonage Point and back to the finish line.

The preparatory signal was given at 1:30, and the boats were started at 1:40. Yankee led over the line in the best berth. Virginia was next and Rainbow last. When the boats started the wind was S., and they carried balloon jib topsail. The breeze freed a little, going to the W., and the boats set spinnakers. The times at the first mark were: Yankee, 2:46:47; Virginia, 2:48:46; Rainbow, 2:49:12.

It was a close fetch to the next mark, but a very slight shift of wind made a couple of hitches necessary. Yankee increased her lead over Virginia, and this boat pulled away from Rainbow. At the second mark the following times were taken: Yankee, 4:05:49; Virginia, 4:11:20; Rainbow, 4:18:15.

It was a beat to the finish line, and at this work both Virginia and Rainbow cut down Yankee's lead materially. Yankee finished a winner, beating Virginia 3m. 1s. and Rainbow 7m. 4s.

Both sailors and amateurs got a good wetting when the squall broke, and after crossing club topsails were gotten down on deck with difficulty. The summary:

	Start.	Finish.	Elapsed.
Yankee, J. Rogers Maxwell	1 40 30	4 55 42	3 15 12
Virginia, W. K. Vanderbilt, Jr.	1 40 53	4 59 06	3 18 13
Rainbow, Cornelius Vanderbilt	1 41 19	5 03 35	3 22 16

Riverside Y. C.

Greenwich, Long Island Sound—Saturday, Sept. 24.

THE fall regatta of the Riverside Y. C., held on Saturday, Sept. 24, marks the close of the racing in the Long Island Sound organizations for the season of 1904.

The lateness accounted for the small number of starters, but the thirteen craft that put in an appearance enjoyed some lively sport. The winners were Spasm, Tartan and Vergeth.

The Regatta Committee, made up of Messrs. Charles P. Tower, George T. Higgins and Charles F. Kirby, were on board the auxiliary yawl Alga, owned by Rear-Commodore A. R. Starr, Riverside Y. C. The committee boat took up her position near the gas buoy off Great Captain's Island. The preparatory was sounded at 1:30, and the three 36-footers were sent away at 1:35. These boats covered an 18-mile course from the starting line to Matinicock buoy to Lloyds Neck and back to the finish line. The wind was strong from the S.W., and the puffs that swept off the Long Island shore at frequent intervals laid the boats well out. Spasm had no trouble in getting away with Anotok, which boat found the wind a little brisk for her to do her best. Mimosa III. met with a slight mishap and withdrew.

The raceabouts and Class P boats went over a 14½-mile triangle. From the starting line to Matinicock Point Buoy, thence to Centre Island buoy and back to the finish line.

Of the four starters in the raceabout class only two finished. Tartan sailed a capital race and beat The Kid 12m. 7s. Busy Bee and Howdy withdrew.

In Class P Vergeth finished a winner by 5m. 25s. Maryola was second, and Firefly was a close third. Heron did not finish. The summary:

	Sloops—36ft. Class—Start, 1:35—Course, 18 Miles.	Finish.	Elapsed.
Anotok, W. G. Brokaw	4	36 21	3 01 21
Spasm, E. D. King	4	28 33	2 53 33
Mimosa III., Trenor L. Park	4	Did not finish.	
	Raceabouts—Start, 1:45—Course 14½ Miles.	Finish.	Elapsed.
Tartan, A. H. Pirie	4	32 18	2 47 18
Busy Bee, R. T. Wainwright	4	Did not finish.	
The Kid, Oliver Harriman	4	44 25	2 50 25
Howdy, George Mercer	4	Did not finish.	
	Sloops—Class P—Start, 1:50—Course, 14½ Miles.	Finish.	Elapsed.
Maryola, C. W. Allen	4	49 04	2 59 04
Snapper, Francis H. Page	4	55 56	3 05 56
Firefly, G. P. Granberry	4	49 19	2 59 19
Vergeth, Addison Hanan	4	43 39	2 53 39
Heron, P. Le Boutillier	4	Did not finish.	
Pampero, R. T. Bailey	5	01 11	3 11 11

RECENT SALES.—Mr. Stanley M. Seaman has made the following sales through his agency: The hunting launch Shack, owned by Mr. Jacob I. Bergen, of this city, to Mr. Gain Robinson, Springfield, Mass.; the racing catboat Trilobite, for Mr. James D. Sparkman, N. Y. Y. C., to Mr. Z. Mayhew, Jr., Brooklyn, N.Y.; the 40ft. cruising yawl Genevieve, by Mr. Conrad Stein to Dr. Alfred R. Starr, Riverside, Conn. Mr. Phillip L. Howard, New Rochelle Y. C., has sold his knockabout Caper, of the New Rochelle one-design class, to Mr. Daniel K. Hanna, Cleveland, O. The boat has been shipped to Tupper Lake.

Gas Engines and Launches.

(Continued from page 468.)

Multi-Cylinder Engines.

MULTI-CYLINDER engines in the two-cycle type have until quite recently been constructed by adding successively separate cylinders of the number desired. While these in a great many cases have given satisfaction, they have as a whole been unsatisfactory. The principal trouble with these engines being that when operated by one vaporizer, they have been inclined to flood in the after-cylinders; that is to say, the gasoline gas being of greater specific gravity than air, of course has a tendency to go to the lowest point, which of course in the majority of boats would be the after-cylinders, as in ninety-nine cases out of one hundred the engines are necessarily set on an incline; the distance apart of the separate cylinders also tending to condense the vaporized gasoline, flooding the bases of the engine, with the consequence that no two of the cylinders have a uniform mixture of gas, and in many cases the after-cylinders refusing to work at all. In order to avoid these difficulties, we notice the multi-cylinder engines have separate vaporizers for each cylinder. While in theory this is good practice, on the other hand it is almost impossible to obtain the correct regulation of each individual cylinder while they are all in operation. In the past year there has been placed on the market a number of multi-cylinder engines with the cylinders in one casting and surrounded by one water-jacket. By this means we bring the cylinders very close together, and maintain them all at an even temperature, using one vaporizer, the connections from it to the engine being by this plan very short and compact, so that we may now be said to be entering fairly on an era of successful multi-cylinder two-cycle engines. We might add, before closing this subject, that we do not consider these engines in their very best form adapted to the novice. Owing to their high speed, their number of moving parts, it is very difficult to detect and locate defects of adjustment or troubles of any kind, and determine in which cylinder the trouble exists. In the four-cycle multi-cylinder engine we have an entirely different proposition, and especially in the double cylinder we find this type very successful. Of course the double cylinder four-cycle engine produces the same results and only has the same number of movements as in the single cylinder two-cycle, therefore a four-cycle four-cylinder is equivalent to a two-cylinder two-cycle engine. One of the principal troubles of the multi-cylinder engine has been the ignition, as of course they are very hard on generators and batteries. It is the universal practice now to use a separate generator or battery for each cylinder. Before taking up the subject of difficulties, we will take up the subject of oils, wire, gasoline, and batteries.

Batteries.

The forms of batteries now universally employed are the dry and the wet battery; in both the dry and wet batteries the elements employed are zinc and carbon and a solution of salts of different forms. In the dry battery the case or envelope is of zinc, forming one of the elements. Into this is inserted a slab of carbon, the battery is then filled with a damp solution of salmomiad; this filling is of many different materials, being saturated with the salts. The battery is then hermetically sealed and ready for business. Should the battery dry out, it will become inactive. Of course they can be recharged to a certain extent by boring a hole in them through the top and adding sufficient water for redamping. This, however, is not successful, as the batteries are so cheap it is hardly worth the trouble. The dry batteries are made in a number of different sizes; No. 2, that is the next to the smallest size, is the one usually employed for marine work. While on this subject it would be well to explain that the voltage of all different size dry batteries is the same, about 1½ volts, but the amperage increases with the size of the cell. If you will look up in any electrical work, you will find a definition of voltage and amperage expressed in such terms that you will probably not understand it. I will therefore endeavor to make the subject clear to you. By taking the flow of water through a pipe and the electric current passing through a wire as a synonym, the volume of water which will pass through a given pipe representing the amperage, the force of the water passing through the pipe the voltage. Wet batteries employed on gas engine work are now universally what are called the Edison-Leland. This is what is known as a closed circuit battery. We believe that the Edison Company have a patent of some description on this form of battery, but as we have seen the battery and used it many years before the advent of the Edison-Leland, we would therefore assume that the patents are on the manufacturers' design, or amalgamation of certain of the elements. In this battery we have the usual carbon and zinc element in a solution of caustic soda or potash called electro-sodium. In order to prevent the evaporation and slopping over, it is customary to place about half an ounce of paraffine oil on top of the solution. This makes a very powerful battery, but it is too bulky for very small boats, and is expensive to start with and maintain. The best method in using batteries is to employ a double set, say each set to contain six batteries, being connected to the engine through a double throw switch, using one set for half an hour, and then charging on to the other set. This will always keep the batteries up to about their full capacity, and one set is regaining its lost vitality while the other is in use. Great care should be exercised in wiring up the battery to see that all connections remain firm, as a loose connection will cause all kinds of trouble. The latest and best method of connecting batteries together is by means of copper ribbon with holes punched out in the end for the binding-post connection. A very good plan in using dry batteries is to dip them, after being assembled, in melted paraffine wax; in fact, a great many are put up immersed solid in wax; but of course as the wax surrounding the batteries has to be poured in hot, it tends to over-heat them, and consequently dry them out; therefore we think the dipping process is much better. In using any kind of battery, care should be taken to keep it dry. In small boats without any cabin, by far the better plan is to have the bat-

teries in a neat box with a suitable handle, so that it can be removed and put in a dry place. Of course with the wet batteries this is not possible. The wiring necessary to connect the batteries with the engine should be made with wire of ample size and thoroughly insulated, and if any joints are made, they should be either soldered or thoroughly covered with wiring tape. All exposed terminals should be kept bright, and where a terminal is made by twisting the wire into a ring, it is a good plan to flatten the ring by pounding it and give the binding-post a better hold. Also at all terminals the wire should be wound into a corkscrew or coil so that new terminals can be cut without shortening the wire, and these coils also tend to prevent the terminals from jarring loose. In wiring up batteries in connection with a magnet or dynamo, care should be taken that the batteries are absolutely cut out when the generator is working, otherwise the generator will throw back on the batteries and produce a short circuit, which will soon use up the batteries.

Boston Letter.

BOSTON, Sept. 26.—There is probably no yacht club in the country which takes a greater interest in the racing of yachts of 30ft. waterline and under than the Boston Y. C. Each year it establishes championships for the Y. R. A. of Massachusetts classes and, this year, two handicap classes were added to the championship list of the club. Cups for the winners of the championships were offered by Commodore B. P. Cheney. They were won by the 30-footer Chewink IV., the 22-footer Clotho, the 18-footer Hayseed, the 15-footer Vera II., the 25-footer Jingo, in the first handicap class, and the 21-footer Scapegoat in the second handicap class. Nine races were held in all, and in figuring the championships, it is assumed that a yacht shall have started in at least six of the nine races scheduled. The races of the club were so arranged that there was no conflict with races scheduled by any other club. In fact, the Boston Y. C. has in every way aided smaller clubs of the Y. R. A. in bringing the boats to their races and by giving up dates. A notable incident of this was the splitting of the mid-summer series of open races to enable the Quincy Y. C. to hold an open race when the tide was right and when the yachts were held together in the vicinity.

The work of Chewink IV. was much the same as in the Y. R. A. series. She won steadily from the start. In two of the races, however, Sauquoit was disabled when she held good positions. The work of Clotho, in the 22ft. class and Hayseed, in the 18ft. class, was notable for steadiness. The championships of both these boats is undoubtedly due to the fact that they were always near the top, even if they did not finish first. The closest work was between the 15-footers, Vera II. and Tabasco, Jr., with Vera II. showing up a little the better. Jingo, in the first handicap class, was the only yacht in any class to sail all nine races. Scapegoat, in the second handicap class, had little difficulty in winning the championship. Both Jingo and Scapegoat were designed by Crowninshield. The following table of percentages is published through courtesy of Mr. Foster Hooper, Secretary of the Regatta Committee:

30ft. Class.			
	Starts.	Per Cent.	
Chewink IV., F. G. Macomber, Jr.	8	79.1	
Sauquoit, T. K. Lothrop, Jr.	8	56.2	
Wasaka, S. R. Anthony.	5	53.6	
22ft. Class.			
Clotho, Cheney & Lanning	8	85.0	
Opitsah V., S. H. & H. I. Foster.	7	63.5	
Peri II., George Lee.	6	60.5	
Medric, H. H. White.	8	56.6	
Warrior, S. C. Winsor.	5	38.6	
Setsu, F. B. Talbot.	2	9.4	
18ft. Class.			
Hayseed, H. L. Bowden.	8	93.5	
Bat, C. F. Adams, 2d.	7	77.0	
Arbeka II., F. P. Bowden.	7	67.3	
Napier, B. S. Permar.	7	64.7	
Mirage II., J. W. Olmstead.	8	63.7	
Boo Hoo, Reginald Boardman.	4	53.5	
Miladi II., F. R. Adams.	4	53.4	
Dorchen, A. W. Finlay.	8	47.3	
Benito, G. H. Wightman.	6	39.7	
*Otter, A. D. Irving.	3	37.1	
Aladdin, George P. Keith.	8	35.4	
Privateer II., Alden & Carleton.	8	35.2	
Fritter, W. C. Loring, Jr.	5	31.7	
Humbug, Cole & Bacon.	4	27.8	
Again, L. B. Goodspeed.	4	26.6	
Gertrude, H. E. Lynch.	4	23.3	
Nicknack, F. B. Holmes.	5	9.0	
Biza, Alfred Douglass.	2	7.1	
Domino, C. C. Clapp.	1	6.2	
Cuyamel, H. L. Bowden.	1	3.3	
15ft. Class.			
Vera II., H. Lundberg.	7	83.3	
Tabasco, Jr., H. H. Wiggin.	8	78.1	
Nibelung, A. P. Loring.	2	19.4	
Little Misery, A. P. Loring.	2	16.6	
Cigarette, Dr. Morton Prince.	1	4.1	

*Protest of Otter by Mirage not decided. The same may change slightly the percentage of both yachts.

First Handicap Class.		
Jingo, George B. Dodge.	9	90.0
L'Aiglon, E. W. Hoagson.	5	60.0
Kit, H. B. Whittier.	4	32.2
Opitsah III., W. F. Whitney.	3	26.9
Mildred II., S. P. Moses.	5	26.6
Meemer, R. C. Nickerson.	3	18.0
Ellema, B. D. Amosdem.	1	16.6
Thelma, A. C. Jones.	2	15.0
Al Kyris, A. M. Moody.	1	11.1
Kiuna, A. W. Larnard.	1	8.3
Opah, W. C. Lewis.	2	5.5
Mashnee, James S. Whitney.	1	4.1
Helcn, F. R. Neal.	1	2.7

Second Handicap Class.		
Scapegoat, W. P. Keys.	7	83.8
Jacobin, T. W. King.	4	53.5
Anne, C. B. Pratt.	3	34.9
Clarita, Walter Burgess.	3	34.8
Tunipoo, C. A. Cooley.	4	26.6
Mildred, C. A. Coleman.	3	26.1
Widow, H. W. Friend.	1	16.6
Aspenet, E. W. Remick.	1	13.3
Minerva, Walter Shaw.	1	11.1
Gadfly, C. W. Chapin.	2	10.7
Gringo, W. H. Brown.	1	8.3
Clarice, J. F. Harvey.	1	5.5
Spinster IV., L. M. Clark.	1	4.7
Sue, T. W. Powers.	1	2.7

Although the Eastern Y. C. had considerable of a contract on its hands to get the larger classes of racing yachts together, and it also had considerable work in connection with its series of power boat races, it still found time to give a series of races for smaller

classes, as it has during the previous two seasons. In giving this series of races the Regatta Committee consulted with the Boston Y. C. and the Corinthian Y. C., and with the Y. R. A. of Massachusetts, in regard to the selection of dates, to the satisfaction of all racing men. For the special open races classes were provided for Classes L, E. Y. C., and Y. R. A. 22-footers. Cups in each class were offered by Commodore Laurence Minot. At the end of the series Dorel and Wasaka were tied in Class L. In the sail-off, on Saturday, Sept. 24, Dorel won out. She is a 30-footer, and was designed by Crowninshield in 1900. In the 22ft. class Peri II. won the Commodore's cup with three firsts out of five starts. She was designed by Messrs. Burgess & Packard. Bat took the Commodore's cup in the 18ft. class with three firsts out of five starts. I am indebted to Mr. Louis M. Clark, Secretary of the Regatta Committee, for the following table:

	July 2.	July 4.	Aug. 1.	Aug. 18.	Aug. 19.	Starts.	Firsts.	Seconds.	Thirds.
*Dorel	1	1	1	2	3	2	1	0	0
*Wasaka	1	1	1	2	3	2	1	1	1
Chewink IV.	1	1	1	2	3	5	1	2	2
Sauquoit	2	5	2	6	5	5	0	2	0
Meemer	3	4	3	4	4	4	0	0	1
Khalifa	3	4	3	4	4	1	0	0	0
Chewink II.	3	4	3	4	4	1	0	0	0
Halcyon	3	4	3	4	4	1	0	0	0

Class E—22-footers.									
*Peri II.	1	2	3	1	1	5	2	0	2
Opitsah V.	1	2	3	1	1	4	1	2	0
Medric	1	2	3	1	1	4	1	1	0

*Wins commodore's cup. d, disqualified. w, withdrawn.

In the Corinthian Y. C., of Marblehead, two championships were awarded. Medric, a Burgess & Packard creation, took the championship in the 22ft. class, and Bat scored her second championship in the 18ft. knockabout class. The Corinthian Y. C. had a most successful season, having a total of 533 entries in all races. I am indebted to Mr. Herbert S. Goodwin, Chairman of the Regatta Committee, for the following table:

22ft. Class.		
Medric	.850	Athlon .233
Peri II.	.755	Clotho .200
Opitsah V.	.513	Tayac .147
Setsu	.480	
18ft. Class.		
Bat	.836	Hugi .434
Arrow	.738	Arbeka II. .427
Boo Hoo	.702	Otter .292
Fudge	.696	Fritter .147
Moslem II.	.614	Moslem I. .089
Hayseed	.558	Humbug .017
Privateer II.	.462	

JOHN B. KILLEEN.

Shelburne Y. C.

THE past season has been a most successful one for the Shelburne Y. C. The work on the new club house is progressing favorably. The annual regatta was a particularly attractive affair, as there was a good list of starters, and the boats were favored with plenty of wind, making the racing interesting.

We publish herewith a resumé of the racing: Shelburne Cup, open to members of any recognized yacht club, to become the property of a winner three consecutive years; won by Menotah, Chester Club, Captain Samuel J. Allan. Fishermen's race, first class, open to fishermen's boats over 26ft. waterline; first prize, Captain Job Nickerson; second prize, Captain Ira Stephens. Second class, open to fishermen's boats under 26ft. waterline; first prize, Captain Judah Crowell; second prize, Captain Clifford Atwood. Shelburne Home Cup, open to yachts not exceeding 28ft., won by Commodore Hervey's Souriquois.

Commodore Hervey gave a dinner party to the officers of the steamers, the officers of club and the captains of the yachts that competed for the Shelburne Cup.

Admiral Sir Archibald Douglas, who was unable to be present, sent the twin-screw cruiser Indefatigable, Captain William J. Grogan, to stay at Shelburne during the regatta. The Dominion Protective Service steamer Curlew, was on hand. Captain Pratt, her commander, not only took the judges and members of the club and their families on board his steamer and followed the yachts around the course in each race, but himself acted as one of the judges.

A series of aquatic sports, consisting of log poling, log rolling, single rowboat race, double rowboat race, climbing greased pole, and a tug-of-war on floats in the water, have been added to the club's programme.

Duxbury Y. C.

Duxbury, Mass.—Saturday, Sept. 24.

In a club race of the Duxbury Y. C., for 18ft. knockabouts, sailed on Saturday, Sept. 24, Domino and Miladi II. collided at the first mark. Domino's mast was carried away and a number of planks were stove in on Miladi II. Commodore C. C. Clapp, owner of Domino, sustained a broken leg. Again won the race by nearly 3m. The summary:

	Elapsed.
Again, William Facy.	1 10 00
Kittawake, H. M. Jones.	1 12 50
Aspinquid II., E. C. Vinal.	1 13 32
Domino, C. C. Clapp.	Disabled.
Miladi II., P. Ford.	Disabled.
Menace, H. Hunt.	Disqualified.

British Letter.

THE negotiations between Sir Thomas Lipton and the New York Y. C. are apparently at a standstill. Naturally everybody in this country who understands the difficulties which the old rule imposed upon the designers of recent Cup challengers, is anxious that the next races should be sailed under the new rating rule, and the reason for this is obvious. The old rule encouraged such a thoroughly bad type of boat, from every point of view except that of actual speed, that it was considered imperative in the interests of American yachting to alter the formula and place such restrictions upon the skimming dish type—of which Reliance is by no means the most extreme example—as would effectually give the death-blow to any future attempt to produce such unseaworthy and dangerous vessels. This being the case, it seems hardly fair that a rating rule which has received such sweeping condemnation should be kept alive for use in what is far more important than any inter-club fixture, namely, an international series of races. Whichever rule is used, the advantages are all on the side of the defenders, but if the old rule is adhered to, it would simply mean that the challenger's chances of success are nil. Even supposing Reliance were considered good enough to defend the Cup, it is evident that the challenging boat must be of a more extreme type still to have any reasonable prospect of winning. Such a boat, however, would be quite unfit to make the passage across the Atlantic, and from what one can gather, neither of our leading designers will undertake the design. Matters seem, therefore, at present to be at a deadlock, but it is persistently rumored that Sir Thomas is so anxious to race again that he will sail under the old rule rather than not at all. The general opinion on this side is that he would be very ill advised to do so, and it is hoped that the difficulty of enlisting one of our leading designers into his service will not be overcome unless the New York Y. C. agrees, in common fairness, to future races being sailed under the present rule of measurement. It has never yet been definitely stated that the club will not agree to this, but apparently it will not give its decision until a challenge has been forwarded. If this is the case, the best course for Sir Thomas Lipton to pursue would be to issue the challenge, and if he finds the races are to be sailed under the old rules, he can withdraw it. The latest rumor is that Mr. Watson, with whom Sir Thomas has been in consultation for some time past, has definitely declined to undertake the work of designing a new challenger. If this be true, and Mr. Fife also cries off, then the soundest plan would be to postpone all ideas of the contest until a more favorable opportunity arises. Some people are in favor of one of our younger designers being given a chance, and Mr. Mylne's name has been freely mentioned. It is, however, too big a jump for a man, no matter how clever he may be, to thus suddenly bridge the gap between a 52-footer and a 90-footer, and it is very doubtful whether Mr. Mylne would undertake such a responsibility. That Mr. Watson's pupil is a very able naval architect, there can be no doubt whatever; but so far his efforts have been chiefly confined to the small classes on the Clyde, the South Coast one-design boats, the Clyde one-design 20-ton class, and a couple of 52-footers. We have only two men capable of turning out such large cutters—Watson and Fife, the former of whom has turned out one boat as good as her opponent—namely, Shamrock II.—and another which would have been a great deal better had she not been fiddled about with just before she left England. The latter boat referred to is of course Valkyrie II. In her first season, 1893, she beat Britannia twice out of every three times they met, and yet she was altered just before she crossed the Atlantic to meet Vigilant without any trial having been made to see whether she was an improved boat or not. The result was disastrous, although, tinkered up as she was, she would have beaten Vigilant in the last race had it not been for the tearing of her spinnakers in the run home. When Vigilant came over to British waters the following year, she met more than her match in Britannia, which was manifestly an inferior boat to Valkyrie II., and the last named boat showed by her poor sailing in 1904 how much she had been spoilt the previous year by the ill advised alterations. Fife has never produced a boat so nearly equal to the Cup defender she had to meet, but, like Watson, he has had plenty of experience, and has, like him, been over to watch the races, and it is to one or other of these men that Sir Thomas Lipton naturally looks for the lines of his new boat. It is to be hoped that all difficulties may yet be swept away, and that a new challenge will be issued under conditions which will put the challenging side on more equal terms with the defenders than has been the case during the past few years.

The West of England regattas began this year well and ended badly. Quite a respectable gathering of boats graced Weymouth Bay on the occasion of the Royal Dorset Y. C. regatta on August 20, though much disappointment was expressed at the absence of the South Coast one-design class which had been catered for right away on to Plymouth. Unfortunately a light, unsteady wind prevailed at Weymouth, and there was some fluking. Rosamond and Merrymaid found a lucky start which put them far ahead of White Heather at the beginning of the race and so enabled Rosamond to save her time for first prize, Merrymaid taking second and Creole third. In the 52ft. class, Maymon sailed in her peerless light weather style, and in spite of a big fluke which put Lucida in the van, the new boat wore her down and won handsomely. With the exception of Gauntlet, the ex-52ft. class finished up the season at this regatta. The six big handicap boats which had sailed at Weymouth went on to Torquay, as did the four 52-footers. A hard wind sprang up on August 22 at the Town regatta shortly after racing commenced, and one of the mark boats broke adrift, so that the big race was rendered null and void. Creole lost her bowsprit and Merrymaid her spinnaker boom in the squalls. Maymon won the 52ft. race, Lucida taking second prize. The big race was re-sailed on August 24, Zinita winning in a light air, with Rosamond second and White Heather third. On August 23 the regatta of the Royal Torley Y. C. was carried through in light airs. The big handicap boats were split into two divisions, exceeding 100 tons and over 50, but

not more than 100 tons Thames measurement. White Heather won the first race and Zinita the second. Maymon gave another inimitable display of light weather sailing in the 52ft. class, Moyana taking second prize. There was only one day at Dartmouth this year, August 26, the regatta of the Royal Dart Y. C., where there were matched for two classes the big handicap boats and 52-footers. White Heather sailed the forty miles at an average pace of 11.5 knots, but in such a quickly sailed race she could not save her time from the others. Rosamond, Valdora, and Merrymaid being the prize winners. Lucida had left for home, but the other three 52-footers were joined by Gauntlet. They sailed a very close race, Maymon beating Moyana by 1m., which in turn defeated Gauntlet by 1m. 40s. The subsequent channel races from Dartmouth to Plymouth and the regattas at Plymouth, do not call for comment, excepting to say that they were not as successful as might have been hoped, owing to the scarcity of yachts there. The season on the whole has been more successful than was anticipated, and the weather has been quite exceptionally fine throughout.

E. H. KELLY.

Seawanhaka Corinthian Y. C.

Oyster Bay, Long Island Sound—Saturday, Sept. 17.

THE day set aside for a club reunion was Saturday, Sept. 17, and a goodly number of the older members of the Seawanhaka Corinthian Y. C. turned out. The gathering was an interesting one, as many of those on hand have been closely identified with the history and development of American yachting.

The races for the 15-footers, in which only the older members could participate, were the star attraction. The race sailed in the morning was for the Alfred Roosevelt memorial cup. The wind was very light from the S.W., and the actual racing was anything but exciting. The interest was not allowed to lag, for the participants and the onlookers, who followed the racing boats in launches, kept up a running fire of suggestions and comments.

The boats covered a 6½-mile course. Cayenne was first around the outer mark. On the next leg Bairn, Sabrina and Chipmonk were all dangerous at times. Cayenne managed to hold the lead and she finished a winner by 27s. Bairn was second. The morning race was for members who joined the club previous to 1883. The summary:

Special race for old members who joined prior to 1883; inside course, 6½ miles. Start, 11:05:

Boat.	Crew.	Helmsman.	Finish.
Cayenne—Wm. Foulke,	Chas. E. Willis.	2 19 04
Bairn—J. W. Beekman,	F. de P. Foster	2 19 31
Sabrina—C. A. Sherman,	H. W. Eaton.	2 19 46
Chipmonk—Thos. S. Young,	J. R. Fred Tams.	2 20 34
Fly—W. E. Roosevelt,	J. E. Roosevelt.	2 20 59

The afternoon race was open to members who joined between 1883 and 1893. The boats covered the same course, but under different conditions, as the wind had increased to a fresh sailing breeze.

Cayenne proved herself quite as smart in a fresh breeze as in a drift and romped away from her competitors. She was 1m. 45s. ahead at the outer mark. Bairn fouled the mark and was disqualified. Cayenne won by 1m. 57s. Imp was second. The summary:

Afternoon race for members who joined between 1883 and 1893. Inside course, 6½ miles. Start, 3:35. Wind S.W., fresh:

Boat.	Crew.	Helmsman.	Finish.
Cayenne—McG. G. Foster,	R. W. Gibson.	5 04 38
Imp—C. A. Sherman,	C. W. Wetmore.	5 06 35
Bairn—Alfred Ely,	W. C. Kerr.	5 07 54
Sabrina—H. C. Rouse,	Colgate Hoyt.	5 08 30
Bobs—W. A. W. Stewart,	A. P. Stokes.	5 09 31
Fly—R. A. C. Smith,	W. J. Matcheson.	5 14 10

At the annual dinner given after the race all hands gathered around the festive board. The losers explained why they didn't win, and the winners explained why they couldn't lose. The whole event was a great success, and the affairs of the club were brought to a close for another season.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

ORDERS FOR NEW DESIGNS.—Orders for designs recently received by William H. Hand, Jr., of New Bedford, Mass., include the following: A 26ft. launch for Mr. J. Parker, of Mobile, Ala., for use in Buzzard's Bay; a 35ft. W. L. (55ft. over all) cruising sloop for A. R. Meyer, of Kansas City; a 17ft. W. L. catboat for Oliver Ricketson, of Pittsburgh, Pa., for use in Buzzard's Bay; an 18-footer for E. P. Hussey, M.D., of Buffalo, N. Y.; an 18-footer for Edw. P. Hendrick, of Portsmouth, N. H.; and a racing keel sloop to rate at 19ft. under the N. Y. Y. C. rule for George Stinkel, of Wiborg, Finland.

INGOMAR ARRIVES.—The American schooner Ingomar, owned by Mr. Morton F. Plant, arrived at New London, Conn., at nine o'clock Friday morning, September 23. She was 25 days out from Southampton, which port she left on Monday, August 29. Actual time of passage was 24 days, 22 hours, 37 minutes. Bad weather was encountered pretty much all the voyage, and she was hove to on several occasions. The log-book gives the days' runs as follows: August 29, 129; August 30, 133; August 31, 124; September 1, 124; September 2, 165; September 3, 95; September 4, 100; September 5, 80; September 6, 78; September 7, 137; September 8, 84; September 9, 182; September 10, 130; September 11, 95; September 12, 75; September 13, 73; September 14, 73; September 15, 159; September 16, 158; September 17, 56; September 18, 80; September 19, 156; September 20, 190; September 21, 218; September 22, 237; September 23, 126. Ingomar is now being put out of commission, and she will be hauled out and put in winter quarters at the Riverside Shipyard.

SCHOONER LURLINE ARRIVES AT SAN PEDRO.—The schooner yacht Lurline, owned by Captain H. H. Sinclair, arrived at San Pedro, Cal., on September 11, after a six months' cruise in the Pacific. Lurline is 75ft. long and 21.2ft. breadth; for such a small boat she has given a remarkably good account of herself. Captain Sinclair

was accompanied by his wife and daughter and Mr. Lew Freeman. Lurline left San Pedro on February 15 last. Their first stop at Honolulu was made only after a voyage in exceedingly rough weather. Quite a long stay was made at Honolulu, and the remainder of the time was spent in cruising around the islands. Leaving the Hawaiian group, the party sailed to the little-visited Marquesas Islands, and thence Lurline wended her way among the Society Islands, tarrying at Papete, the chief port of quaint and distant Tahiti. An interesting sojourn was made among the Fiji group, and also a call at Apia, German Samoa.

A New Phase of the Case.

He took the lady in his boat;

She was a buxom neighbor.

She said: "It's really capital."

He muttered, "It is labor."

—Washington Star.

Canoeing.

A. C. A. Meet.

THE twenty-fifth annual camp of the American Canoe Association, held at Sugar Island, in the St. Lawrence, Aug. 5 to 19, marked another step in the progress of the A. C. A., being with one exception the largest camp on record, and, better still, being a camp where people stayed from start to finish, rather than merely "fitting" into camp and out again.

It also marked an epoch in the Association's history, in that the executive committee re-elected the outgoing commodore, C. Fred Wolters, of Rochester, the first time that this has ever been done. It proved two things; that a man can be commodore and still have enough canoeing enthusiasm to assume the burden again, after the arduous duties prior to and during camp; and that the confidence reposed in Commodore Wolters last year was not misplaced. Seldom, if ever, have the men of the A. C. A. been so lucky in their choice of an executive, and if the sentiment of the camp just over counts for anything, 1905 will see probably the largest and best camp in the Association's history, with C. Fred Wolters at the helm again.

The arrangement of camp was about as last year, except that the officers made their own camps where they pleased, and thus did away with the bothersome idea of official headquarters tents. Instead, there were but three tents at headquarters—the commodore's, the secretary-treasurer's and the store tent, where the ever-active and genial camp-site committee man, H. W. Breitenstein, made his headquarters. These tents were in use by day, but at night officers and men all camped where they chose, making the various club centers far more attractive than they would otherwise have been.

The committees were efficient, and all plans for the success of the camp were certainly carried out as well as they have ever been.

The racing suffered for want of competitors, for the prizes were well chosen and the Regatta Committee worked hard for the success of the annual races, and it was not their fault that so few toed the mark in response to their husky megaphoned calls for entries. The entry of several open canoes with considerably less than 60 sq. ft. sail area marked a new departure in the three "record" races, although the record, itself, was won by the regulation type of sailing craft—16ft.x30in. The two open canoes that finished in all three races, however, did well, and more of this class of racing may confidently be expected next year. Reg. Blomfield, of Toronto, carried off the paddling honors, being the best man by all odds that has attended camp in almost a decade. The sailing trophy was won by F. C. Moore, of N. Y. C. C., and the Dolphin trophy by D. B. Goodsell, of the same club.

The mess arrangements were excellent, but while the general mess forms a central meeting place for the campers at large, and is for that reason a good idea, more than ever this year was noticed the disposition of the men to mess for themselves, and with the results of their day's fishing and the supplies from the camp store—the best one ever run at camp—those who camped for themselves lived well.

All in all, Sugar Island in 1904 was a great big success—thanks to the officers and committees and to that never-failing spirit of good-fellowship that permeates the entire body politic of the A. C. A. This year saw a few of the old-timers who had failed to show up last year—R. J. Wilkin, President of the Board of Governors; F. G. Mather, the "Last of the Mohicans;" Frank G. Palmer, of the N. Y. C. C., fresh from Boeas del Toro, Panama, and others were warmly welcomed back to the fold.

So long as officers are chosen with discretion and members do their share toward the success of camp, just so long will the Annual Camp be the Mecca of the summer for its jolly fellows and pretty girls, and so long will it stand for all that is clean and wholesome in the way of sport and recreation.

464.

Proposed Amendment.

ROCHESTER, N. Y., Sept. 25.—*Editor Forest and Stream:* I hereby give notice that at the annual meeting of the American Canoe Association, I shall move to amend the constitution as follows:

Article VI., Section 1, to read: "Executive Committee. In each Division there shall be elected one member for the first one hundred or fraction thereof, one member for the second hundred or fraction thereof," etc. If a Division has 90 members it shall be entitled to one member of Executive Committee, and if 390, it shall be entitled to four members, and so on.

This article has long been subject to different interpretations, and I propose this change to make it more definite.

JOHN S. WRIGHT.

Knickerbocker C. C. Fall Camp.

"Heave away, my bonny boys,
Heave away, heave away;
Heave away, and don't you make a noise,
For we're bound for Australia."

HUMMING the above refrain as they bent to the task of preparing for the cruise, the members of the Knickerbocker C. C. "heaved away" with a will, for they were preparing for their annual fall encampment and regatta, which was held at Hermit Point-on-the-Hudson, Labor Day, and the two days previous thereto. It is not always possible to start for camp as a fleet, and this was no exception to the rule; but as the canoes started from the club house singly and in pairs, cries of "I'll see you later" were exchanged, and the cruise was started and the craft were "bound for Australia."

Hermit Point, as you will see by the cut, is truly "a thing of beauty and a joy forever," being one of those delightful bits of landscape with which nature has so liberally endowed the Palisades of the Hudson. Situated about eight miles up the river from the Knickerbocker club house, it is within easy paddling and sailing distance, and therefore easily accessible to the members and visitors. The ruins of an old pier form a

Tilting Match—Knickerbocker C. C. Regatta.
Photo by A. E. Sanford.

breakwater, behind which smooth water is nearly always found, even on the roughest days. There is a wide, firm, sandy beach and an excellent spring of clear, cold, sparkling water, which, considered altogether, make this spot an ideal camping place, and to which it is a pleasure to go, forgetting all business cares and live close to the bosom of mother nature, a life which is idealistic in every meaning of the word.

Only a small portion of the encampment is visible in the photograph. The tents extended some distance up the beach to the right, and nearly filled the small plateau up the hill, the dense foliage hiding most of the tents on the plateau.

Three things are uppermost in the minds of the average canoeist while in camp: Canoeing, eating and sleeping. I have placed them in what I conceive to be their proper order; canoeing first, because that is the prime object in coming to camp; eating, because the

"Hermit Point"—Knickerbocker C. C. Camp.
Photo by A. E. Sanford.

exhilarating exercise derived from the use of the paddle produces an appetite which is nothing short of marvelous; sleeping last, because that seems to be always the last thought of one who has never undergone the experience—mere words cannot convey the delight which is experienced at rolling up in a blanket and lying down on a cot, look out at the sparkling beauty of the heavens and be crooned to slumber by the sleep-inspiring chorus of the night. On arising with the birds in the morning, what would more naturally suggest itself than a refreshing dip in the cool waters of the Hudson? After the dip, breakfast; after breakfast, a morning on the river, dinner, and afternoon spent in sailing or paddling, as fancy may dictate, then supper. In the above list, you have the business part of the day's programme, but it would never do to slight a very important number on it, the camp-fire.

As the sun was throwing its last faint rays beyond the crest of the Palisades, the boys commenced gathering material for the camp-fire. An old disused dock furnished ten-foot timbers about one foot square, at the butt, and these, heaped up in a pile on the beach when lighted made a fire which could be seen for miles around. After the fire had become well kindled, the boys placed their chairs around it in a semi-circle, and to the music of club songs, disposed of large quantities of corn and

potatoes, which were roasted in the embers. Jokes, good-natured chaffing and stories, all liberally interspersed with songs, contributed to fill out the evening to the full limit of enjoyment.

The races were held on Labor Day, which dawned bright and clear, with a 15-knot breeze from the N.W. and a strong flood tide running. The combination of these two weather conditions filled the river with white-capped waves, which made the sailing races highly interesting spectacles, and taxed the skill and knowledge of the skippers of the various craft to the utmost. The 85-foot event was started ten minutes after the 65-foot

A Close Finish—Knickerbocker C. C. Race.
Photo by A. E. Sanford.

event, and although the course was six miles, the smaller class was not overhauled before the finish. An idea of the exciting nature of the sailing races may be derived from the cut, which shows the close finish of the 85-foot class. The paddling events were remarkable for their stubborn contests from start to finish, there not being more than one length's difference between the winner and second man in any event. Ben J. Cromwell, Jr., vanquished all comers in the tilting contest, thereby becoming champion of the Hudson. Since entering this class, Cromwell's form has improved remarkably, as only two years ago he was a raw recruit; but constant practice has made of him an expert in this sport, his foot-work being especially remarkable. The race of the Stockwell brothers in the tandem doubles was one of the best ever seen on the river, and their stroke was a beautiful type of machine-like precision.

Camp was broken about dusk, and as the fleet floated down the Hudson homeward bound, the unanimous opinion of the canoeists was that the meet had been a tremendous success, and the camp and regatta committee, composed of Louis Reichert, chairman; W. G. Jones, Jr., and M. Ohlmeyer, deserved great credit for their efforts to make the camp the success it proved to be, and for their taste in choosing the handsome prizes.

A. C. A. Executive Committee Meeting.

To the Members of the Executive Committee, Board of Governors and Racing Board:

The annual executive meeting of the American Canoe Association will be held at Rochester, N. Y., October 15, 1904.

C. F. WOLTERS,
Commodore.

JOHN S. WRIGHT, Sec'y-Treas.

Why He Changed His Mind.

"WE have an invitation to float down White River with a canoe party," said a Nevada contractor to a Nevada lawyer.

"I'm too busy to go—couldn't think of it," replied the lawyer.

"They tell me," continued the contractor, "there is a bar about every half mile."

"A what?"

"A bar."

"Every half mile?"

"Every half mile."

"How long does it take a canoe to travel a half mile?"

"About ten minutes."

"I might arrange to go," said the lawyer. "I need a rest. Tell the boys to hold the place for me. I'll be with them if I don't break a leg!"—Kansas City Journal.

Animals at Play.

WHEN even trout have a form of play, it cannot be matter for surprise that both beasts and birds share the pleasure which frolic of a kind gives to the cold-blooded fishes of our rivers. But the degree in which their sport takes the form of game varies. Some animals will play with objects, just as a child amuses itself with a cup and ball or with a spinning top. Others play in company and use the element of competition and mock contests. But perhaps the commonest games of all are those in which they use their unique powers of speed, flight, climbing or diving in a kind of display in which they often combine the sense of successful physical achievement with some added satisfaction, evidently clear to their consciousness of doing this in company. The latter points to a rather highly organized degree of consciousness; but in view of the combined performances and displays of certain animals, especially birds, it is difficult to think that this can be absent. On one of the fine and still afternoons of the past winter, in the complete aerial repose which follows a day or two of cyclonic storms, when the London sky is "washed blue" after the downpour of rain which commonly follows these disturbances at a height of some 300 feet above the Green park, the London gulls were engaged in a form of combined aerial play, floating in a

long series of wide circles of very nearly the same diameter, though the number of birds in each varied. Though when seen from below this long ribbon-like festoon of floating birds seemed to be on a plane, they were really flying in spirals, rising and descending by setting their wings at different angles. As fresh birds from the region of the river saw this choregic game going on, they flew up in detachments and fell into place, adding to the number of circles, until the distance from the first to the last equaled nearly the whole length of the park. They then drifted slowly westward, maintaining the same order and concerted movement.

There is no doubt that many species of birds, especially those which frequent the surface and shores of water, are fond of this decorous play. Homer hints at it in his description of the happy birds on the Meander. Virgil notes the pleasure of the swans in their combined flight—*Aspice bis senos latantes agmine cygnos*. And following Homer's cranes to the continent of Africa, where they engaged in winter warfare with the pygmies, J. G. Millais has noted that every evening on the banks of the Nuanetzi River the cranes assembled and spent the last hours of daylight in aerial play, "floating spirals" over the African stream. The "floating" game is enjoyed by several species of English birds other than gulls, but not in such a combined form. Certain states of the air, when the winds are hushed and the sunbeams are bright, invite them to the sport. Rooks will ascend at such times to great altitudes, soaring in spirals and descending only to rise again. But it is the play of individuals in company, not in concerted movement. Wood pigeons do the same, and occasionally the ravens by the cliffs. The latter birds have a form of aerial play peculiar to themselves and "tumbler" pigeons. In the middle of a high flight they suddenly cease to move their wings, and fall headlong through the air, croaking loudly, as if to call attention to the joke. The water tournament of ducks, both wild and tame, and of domestic geese are a regular part of their activities. The call to play seems to come to them from the sky, just as in the case of the birds which combine for aerial games. When the sun is at its brightest and hottest, they are suddenly seized with an impulse to begin the sport. Beating the water with their wings, they rush hither and thither on the surface, and then dive one after another, keeping the fun going until they are all out of breath. It is very seldom that geese are seen to dive, but when playing this game they do so as instantaneously as does a dabchick or water hen, though the complete immersion and descent of so overgrown a bird as a fat domestic goose must entail considerable effort.

These combined displays are not common among mammals. The case of the "waltzing mice" naturally suggests itself. These little creatures run in circles incessantly, and when a number of them are together they appear to be acting by a common understanding. It is said, however, that these mice are suffering from an hereditary form of brain disease, which makes it impossible for them to run otherwise than in circles. But the roe-deer in the woods near Cawdor Castle have regular rings in which they amuse themselves by running in circles. By far the most playful of the young of the various animals are kids. They seem to have imagination as well as extraordinary activity, and being able to climb or leap on to almost any place which takes their fancy, their success in games such as "follow my leader," or the well-known one of "holding the fort," which is also played by lambs and puppies, is great.

Their exploits in this way sometimes cause serious anxiety to their mothers, who may be heard bleating in an agitated manner when they see one of their adventurous young standing on top of a wall, or running over a beam lying across a sawpit, during the progress of these games. Horses, if not ingenious in devising games, will play at almost any age. A mare of 22, which had been worked in a brougham in London for nearly the whole of her life, was taken down into the country and turned out with a young filly in a meadow. The change was so exhilarating that both did nothing but play, in a rough way, all day long, the old mare being the keener. They pretended to fight, pursued one another, and generally indulged in the rough antics which are appropriately named "horse play," till the coachman separated them, declaring that the old mare tired herself more than if she were in the shafts. Cattle, on the other hand, never seem to play at all, whether young or old.

Rifle Range and Gallery.

National Rifle Association.

In the opinion of military experts, the action recently taken by the National Rifle Association of America at its annual meeting at Sea Girt, N. J., looking toward the abolishment of annual membership in the Association and confining the membership to clubs or other organizations, will have a most important bearing upon the future of rifle practice in this country. Heretofore the National Rifle Association has been composed of life members, annual members and affiliated clubs. It is now proposed to make it strictly a central or governing body for the shooting clubs of the country, both civilian and military, and to confine its membership to representatives of these organizations rather than to individuals. The Association recommended to the board of directors that suitable action should be taken to effect this change, and there is no doubt the recommendation will be adopted. In treating on this subject, in his annual report, Lieut. Albert S. Jones, the secretary of the Association, pointed out that, although only five years have elapsed since the reorganization of the National Rifle Association, there are affiliated with it fifty active shooting organizations, representing nearly every section of the country and every class of shooting. Within the last year eighteen organizations, eleven of them military, five civilian and two State organizations, affiliated with the National Association.

Another action by the Association cannot fail to receive favorable comment from all those interested in rifle shooting, and that was the adoption of a resolution suggesting to the board of directors the advisability of holding the national meeting of the Association at the same time and place with the contest for the national trophy. It was never intended that the contest for the national trophy should be separated from that of the National Rifle Association, and the act of Congress creating the trophy provided that it should be shot for under rules and regulations of the national board, which is largely made up of trustees of the National Rifle Association. This year, however, the national match got side-tracked into a strictly army competition, contrary to the wishes of the national board, which brought the national trophy into existence. By uniting these two contests the number of prizes will be greatly increased, as will the attendance, for it is impossible for many of the expert marksmen to take four or six weeks away from their business in the fall of the year to

devote to these contests, as would be necessary were they held separately.

The announcement was made at the annual meeting of several additional prizes, which will be offered next year for long-distance shooting, as well as in the revolver matches.

In his annual report, Lieut. Jones suggested that all affiliated military organizations hold a competition for the National Rifle Association medal previous to the fall meeting and send to such meeting, at the organization's expense, the winner as the official representative of that organization in the President's match for the individual military championship of the United States. Many foreign countries have a plan similar to this, the difference being that the preliminary shoots are held by countries or cantonments. Such an arrangement would stimulate a great deal of friendly rivalry with the organizations for the honor of being sent to the big shoots.

Estimating Distances.

The probability that Congress will make provision at its next annual session for a large annual appropriation to be devoted to the purchase of ranges, the equipment of ranges, indoor and outdoor, distribution of ammunition to organizations of riflemen, etc., in accordance with the plan drafted by the National Board for the Promotion of Rifle Practice, is responsible for renewed interest in rifle and revolver shooting. There are three—"yea, even four," as the Psalmist might say—requisites to good marksmanship: a gun, a target, ammunition and a place to shoot. The national board has announced its desire to secure an enrollment in the National Marksman's Reserve of from 500,000 to 1,000,000 men, and if Congress is really in earnest, adequate provisions must be made for the guns, ammunition, targets and, above all, ranges.

But, pending appropriations for this purpose, those desiring to learn to shoot, can find considerable amusement and experience that will be valuable later with a rifle, by undertaking to estimate distances. In the days to come, more and more attention will be paid to shooting at unknown distances, and to get into the front rank of shooters, skill in estimating distances is essential. Practice in this can be obtained very easily by first learning to step distances correctly, one step to the yard, and then, in course of a stroll through town or country, selecting an object, estimating the distance and counting the number of steps necessary to reach it.

This proposition appears to be a simple one, but it is more difficult than it seems, and the results—especially if the trials are made by parties of four or more—will be amusing, as well as instructive. Some time ago a party of thirty-five or forty gentlemen, the most expert rifle shots in the country, were gathered at Sea Girt, N. J., for the matches on the result of which depended the selection of a team to go to England to shoot for the Palma trophy. Some one asked how far it was to a certain fence, and immediately every man estimated the distance. After much good-natured bantering, the distance was paced, and the result was ludicrous. Every one had over-estimated it, the closest guess being 50 yards out of the way, while the majority exceeded it by 200 yards.

Do you know?

That at 30 yards the white of a man's eye is plainly seen, and the eyes themselves up to 80 yards?

That at 100 yards all parts of the body are seen distinctly, slight movements are perceptible, and the minute details of the uniform can be distinguished?

That at 200 yards the outlines of the face are confused, and the rows of buttons look like stripes?

That at 400 yards the face is a mere dot, but all movements of the legs and arms are still distinct?

That at 600 yards details can no longer be distinguished, though files of a squad, if the light is strong, can be counted?

That at 800 yards the men in a squad cannot be counted, nor their individual movements distinguished?

At 1,000 yards a line of men resemble a broad belt; the direction of their march can, however, be readily determined. At 1,200 yards cavalry can be distinguished from infantry, and at 2,000 yards a mounted man usually appears as a mere speck.

Yet in these days of long-range weapons, battles are fought at a distance of 1,000 yards, and it is desirable for marksmen to qualify at that range. The new rifle, with which our troops are to be equipped, has a maximum effective fighting range of 4,781 yards, or more than two and one-half miles. In other words, a bullet from this rifle will kill or disable at a greater distance than the man firing it can distinguish an individual enemy from the surrounding landscape.

Presque Isle Rifle Club.

ERIE, Pa., Sept. 17.—The following scores were made to-day, a good many of the shooters being visitors:

W A Parker.....	82 75 75—232	G E Shafer.....	68 67 64—199
J Bacon.....	75 73 72—220	F D Allen.....	67 66 65—198
J Almeda.....	76 73 71—220	G C Hahn.....	67 64 59—190
Dr A C Wheeler.....	78 73 66—217	J W Paul.....	61 48 47—156
*W S Wheeler.....	78 70 66—208	W J Leyer.....	60 50 45—155
J G Germann.....	73 71 69—213	W W Jordan.....	59 49 43—151

*The score-keeper made this score 213; I can only find 208 in it. CABIA BLANCO.

Rifle Notes.

The annual King shoot of the Dayton Sharpshooters will be held at their new range, on the Dayton Gun Club's grounds, on Oct. 20. There will be free-for-all events and riflemen will be welcome.

The silver cup given to the Dayton Sharpshooters by Michael J. Schwind, and which has been contested for the past few years, will be presented to John F. Beaver, by unanimous vote of the society. He has won it three times this year, and each time by the same score, 118 out of a possible 125, five shots, 200yds., muzzle rest. A new cup will be offered at the May contest, and any member winning three of the six contests will become its owner.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Sept. 28.—Concord, Staten Island.—Richmond Gun Club all-day shoot. A. A. Schoverling, Mgr.
Sept. 28-29.—Concordia, Kans.—The Interstate Association's tournament, under the auspices of the Concordia Gun Club. L. S. Myers, Sec'y. Elmer E. Shaner, Mgr.
Sept. 28-29.—Homer, Ill.—Homer-Ogden Gun Club tournament.
Sept. 29-30.—Centralia, Ill.—Trapshooting Club tournament. T. W. Rice, Sec'y.
Oct. 4-5.—Crawfordsville, Ind.—Gun Club tournament.
Oct. 4-5.—Allegheny, Pa.—North Side Gun Club.
Oct. 6-7.—Dalton, O.—Gun sixth annual tournament. Ernest F. Scott, Capt.
Oct. 6-7.—St. Marys, Pa.—Two-day shoot.
Oct. 10-11.—Carthage, Mo.—Seventh tournament of the Missouri League of Trapshooters. Dr. C. B. Clapp, Sec'y.
Oct. 11.—Batavia, N. Y.—second annual fall tournament of the Holland Gun Club.
Oct. 12-13.—Sistersville, W. Va.—Gun Club fall tournament. Added money to all events, and prizes. Ed. O. Bower, Sec'y.
Oct. 12-13.—Indianapolis, Ind.—Gun Club fall tournament. James W. Bell, Sec'y.
Oct. 15.—Poughkeepsie, N. Y.—Poughkeepsie-Ossining team match.
Oct. 18-19.—Litchfield, Ill.—Consolidated Trapshooters' Congress.
Oct. 18-20.—New London, Ia.—Gun Club tournament. Dr. E. C. Cook, Sec'y.
Oct. 26.—Concord, Staten Island.—All-day target shoot of the Mullerite Gun Club, on the grounds of the Richmond Gun Club. A. A. Schoverling, Mgr.
Nov. 1-3.—St. Louis Mo.—World's Fair shoot; live birds and targets. Alec D. Mermod, Mgr., 620 Locust street.
Nov. 17-19.—Tampa, Fla.—Tampa Bay Rod and Gun Club, \$400 added. J. A. Hansbrough, Sec'y.
*Western Pennsylvania Trapshooters' League tournaments. C. G. Grubb, Sec'y, Pittsburg.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

Mr. D. A. Upson, of Cleveland, O., famous as one of America's most skillful trapshots, returned recently from a shooting trip in the chicken country. He enjoyed excellent sport.

The attractions of the fields and woods where birds and beasts abound have tempted many away from their regular domicile, hence there is less activity in trapshooting matters at this season.

The second annual fall tournament of the Holland Gun Club will be held at Agricultural Park, Batavia, N. Y., Tuesday, Oct. 11. The programme will be issued in a few days. Messrs. James Knickerbocker and Chas W. Gardiner are the members of the committee.

Capt. C. G. Blandford writes us as follows: "Kindly announce that the next team shoot between the Poughkeepsie and Ossining. N. Y., gun clubs will be held at Poughkeepsie on Oct. 15. All members of this club are requested to be present on the club grounds for practice Oct. 1."

The fourth annual tournament, under the auspices of the Raleigh, N. C. Club, in conjunction with the State Fair, Oct. 19-20, has a programme of ten events, each day, open to all amateurs; \$2 entrance, \$7.50 added. Total of added money, \$150. The Lyon trophy, valued at \$100, will be shot for by North Carolina amateurs only, and the highest score made on Thursday, Oct. 20, in extra event, will be declared the winner. This cup must be won twice in succession to become property of the shooter. Targets 2 cents; sliding handicap, 16 to 20yds. Shooting commences at 9 o'clock. Moneys divided 40, 30, 20, 10. Mr. R. T. Gowan is the secretary.

The programme of the first annual tournament, given by the Recreation Rod and Gun Club, of Morgantown, W. Va., Sept. 27, provides ten events, at 15, 20 and 25 targets, three of which have merchandise prizes. Event 6 is the five-man team race, 25 targets per man. Events 7, 8, 9 and 10 are governed by the Jack Rabbit system. Shooting commences at 9:30. Guns, shells, etc., delivered on the grounds free. The programme further states that "it will be entirely optional with shooters whether they shoot for prizes and money, or simply for practice. Merchandise prizes will be shot for under a sliding handicap, viz.: Each contestant will get to shoot at as many extra targets as he misses in scheduled event, also one extra additional target for every three targets missed in scheduled event. Example: J. Brown shoots at 15 targets, breaks 12; he is entitled to come to score and shoot at 4 more targets. If he broke 11, he would get five extra; if 10, he would get 6 extra, and if 9, he would get 8 extra targets. For further information address Elmer F. Jacobs, Sec'y."

BERNARD WATERS.

Recreation Rod and Gun Club.

MORGANTOWN, W. Va., Sept. 23.—The Recreation Rod and Gun Club held its twenty-fifth regular weekly shoot this afternoon at Recreation Park, with sixteen guns out. The gusty wind conditions made good scores very hard to make, and as a consequence, our percentages were not up to the average for the past month.

The club championship medal was won for the week by Capt. John M. Cobun, with an average for the afternoon's programme of 90.2 per cent.

In the club event, Price was high in Class A, with 24. Cobun was high gun in Class C, with 17. The scores:

Ten targets: Dawson 7, Price 5, Jacobs 8, Jas. H. Smith 5, J. L. Smith 9, B. S. White 7, Taylor 8, Geo. F. Miller 7, Kennedy 8, Van Voorhis 8.

President's cup, handicap: Dawson shot at 18, broke 16; Price 19, 17; Jacobs 18, 11; J. H. Smith 22, 13; J. L. Smith 19, 9; B. C. White 18, 15; Taylor 20, 16; Geo. F. Miller 21, 13; Cobun 22, 18; Kennedy 18, 13; Moreland 19, 13; Herd 20, 11; Cronniger 20, 9.

Club prizes, 25 targets: Dawson 20, Price 24, Jacobs 18, Jas. H. Smith 17, J. L. Smith 15, B. S. White 19, Taylor 18, Geo. F. Miller 16, Cobun 24, Kennedy 15, Moreland 17, Herd 11, Cronniger 16, Chas. White 13, L. P. Smith 15, Van Voorhis 22.

Fourth event, club team race, eight men, 15 birds per man: Price, captain, 14, Dawson 11, Geo. F. Miller 11, Kennedy 10, Moreland 11, L. P. Smith 10, Herd 9, J. L. Smith 10; total 86.

Cobun, captain, 14, B. S. White 10, Jacobs 13, Jas. H. Smith 13, Van Voorhis 10, Taylor 13, Cronniger 8, Chas. White 12; total 93.

E. F. JACOBS, Sec'y.

"Pigeon Main."

THE following, concerning a "pigeon main," is taken from the Norfolk, Va., Chronicle: The pigeon main between Norfolk and South Norfolk will take place Sept. 20 at Lafayette Park, beginning at 2:30 o'clock, for \$100 a side. Well-known shots, representing Norfolk in this shoot, are Capt. E. O. Lambert, Capt. Washington Lambert and Mr. F. L. Jarvis. Those representing South Norfolk are Mr. Henry Grenalds, Mr. C. C. Grenalds and Mr. T. M. Claud.

All these gentlemen are well known as experts with the gun in this special line of work, and an interesting entertainment is promised to all lovers of the sport. Newport News, Suffolk, Cape Charles and Baltimore will participate in the sweepstakes.

Mayor Riddick will contest with Mr. James Ridgewell, shooting 10 birds each for a setter dog, presented by Capt. Wash. Lambert. The judges of the contest will be Mayor Riddick and Mr. James Ridgewell.

After the shoot, Capt. Wash. Lambert will endeavor to lower the world's record of breaking 100 glass balls, the record being 4 minutes and 29 seconds. This feature of the day's sport will no doubt be very interesting to all. Half the gate receipts go to the Boys' Home.

Aquidneck Gun Club.

NEWPORT, R. I., Sept. 21.—Eighteen contestants participated in the shoot of the Aquidneck Gun Club in the weekly shoot. The main event was the semi-monthly contest for the Winchester gun and the weekly shoot for the gold badge. Scores:

Events:	1 2 3 4	Events:	1 2 3 4
Targets:	10 15 10 15 T	Targets:	10 15 10 15 T

Bound Brook Gun Club.

BOUND BROOK, N. J. Sept. 17.—The last shoot for the Pardoe cup was shot to-day. Mr. F. K. Steele wound things up by winning the cup three successive times, which is not an easy thing to do. He is to be congratulated, as he made a good fight for it under discouraging conditions. Mr. Steele is a hard worker in the club. It was a popular win. Mrs. Pardoe visited the club and took a try at the bluebirds, making a good score for the first trial.

Our club is considering putting up three silver cups to be shot for in classes.

Montclair Gun Club.

Montclair, N. J., Sept. 24.—Some fourteen men lined up at the traps at the shoot of the Montclair Gun Club. The wind was very strong at times, and this was productive of some very uneven scores.

Event No. 2, prize a buckhorn-handled corkscrew, was tied for by Mr. Kendall and Mr. Geo. Batten, and on the toss, went to Mr. Batten.

Event No. 3, a team match, five men on a side, captained by Messrs. Babcock and Batten, was won by Mr. Babcock's team; score 79 to 75.

All the shooting done from now to Jan. 1 will count on the match for the silver loving cup for the member who makes the longest consecutive score on any one afternoon.

Mr. Kendall did the best to-day with 19 straight. Mr. T. E. Batten was not in his usual form, owing to a recently dislocated shoulder.

CHARLES DALY GUNS.

No. 375. DIAMOND DALY.

Prices, \$125.00 to \$500.00 Net.

The Locks and Action are the genuine Anson & Deeley system—Charles Daly pattern—which means that the frame is one inch longer than the regular Anson & Deeley frame, making the leverage greater. Deeley locks the safest and best; they are the most expensive to make and are used by several of the leading makers of high-class guns. The Lock parts are highly polished and finished better than most guns costing twice as much.

The stocks are made of selected Italian Walnut, with pistol grip and rubber butt plate. The Fore End is fitted with the celebrated Deeley & Edge patent fore end snap.

The Barrels are "Krupp's Genuine Fluid Steel," marked "Fluid-Steel-

SPECIFICATIONS:

Gauges, 12, 16 and 20.

Barrel, 26, 28 and 30 inches long.

THESE guns have been made in the factory of Charles Daly, in Suhl, Prussia, Germany, for the past thirty-five years. This town produces only high grade guns and there are probably more fine guns and rifles made here for the aristocracy of Europe than in any city in the world. We have had the pleasure of selling thousands of these fine guns to gentlemen in the United States, and our customers can testify to the shooting qualities, fitting, balance and beautiful lines of **Charles Daly Guns**. It is conceded that no gun makers give more attention to details, such as the inside lock work, fitting of the locks and woodwork, finishing of the barrels, etc., than does the **Charles Daly Gun Factory**.

Our aim has been, and will continue to be, to make only the highest grade guns and we shall, as in the past, spare no expense to turn out the best gun in the world, 50 per cent. better than those of other makes which are held at the same price.

J. P. SAUER & SON GUNS

THIS firm has for some years made these guns for us, under contract. They have been introduced in this country as the **Charles Daly Field Gun**. The very fact that we have allowed them to bear the name of **Charles Daly** is a guarantee of quality, as there is no better known and more carefully made gun in the world than the **Charles Daly**.

Messrs. J. P. Sauer & Son being desirous of increasing their business in the United States, have, therefore, requested us to sell these guns under their own name, and in order to facilitate matters, have placed us in a position to sell them at prices which will place them within the reach of all sportsmen wishing a strictly first-class gun at a moderate price. Hereafter the guns will be made in all popular weights that are required by American sportsmen—light, medium and heavy, for upland, duck and trap shooting.

No. 108. Three Barrel Hammerless.

Prices, \$90.00 to \$200.00 Net.

The Lock parts are "Krupp-Essen" on the rib. These barrels are equal or better than used in many guns costing three times as much. The guns are bored on the same system that has made the Daly gun renowned for its wonderful shooting qualities. The Rib is beautifully matted with a large Extension Rib which, with two bolts on the lug, gives it three distinct catches.

Drops, 2 1-4 to 3 inches.

Weights, 5 1-4 to 7 3-4 pounds.

LIST PRICE, \$80.00 UP.

DOG CRATES.

In manufacturing these dog crates, we keep two points constantly in view. One is to save the money of the dog owner; the other is to save the life and limb of the dog. We accomplish the first by making the crate so light that the express charges will be greatly reduced, the saving on the first two or three trips often paying the cost of the crate.

WESTERN TRAP.

Paducah Tournament.

PADUCAH, Ky., Sept. 19.—The four-day tournament held Sept. 14-17, was not as largely attended as it should have been, considering the very liberal programme and the combined effort of the Paducah Gun Club and the Kentucky State League.

Two days were given up to target shooting and two to live birds. In the target events Marshall led and won the average, with Brody, Spencer, Ben Starr and Anderson close up and fighting until the last. If "our Tom" keeps going, he will get well up in the high average tournament list before the season closes.

The live birds were not, as a rule, of the corking kind; yet now and then there was a good one, which spoiled straight scores. Still, there were too many straights. In the 12-bird event ten went straight, half those entered. In the 25-bird handicap, seven killed out, and then it took 35 to decide the handicap tie.

The championship of the State is now with Ben Starr, who killed 60 straight in the shoot, and for the tournament, 119 straight, which is a remarkable score, and may never be beaten.

The weather was fine, and the officers are not discouraged with the poor attendance and will endeavor to hold two big shoots next year. The scores:

Shoot-off: B. Starr 35, Q Ward 34, Duncan 33, M. Starr 25.

Afro-American Trapshooters' League.

St. Louis, Sept. 23.—During the past two days the colored trapshooters of this country have been holding the second grand Afro-American handicap at targets, at the DuPont Park, this city.

St. Louis was selected on account of the cheap rates to the World's Fair. The weather man was kind, and nothing lacking save that the wind was strong, and as the traps still face the sun, the shooting was difficult during the last afternoon, when the championship was decided.

The attendance was not so large as expected, though several States were represented, viz.: J. Edward Deaton, Dayton, O.; J. W. Maxey, Springfield, O.; D. C. Lawry, Urbana, O.; J. R. Roundtree, B. T. Willis, Chas. Johnson, F. Milliken, W. E. Tucker, Little Rock, Ark.; J. Crockett, S. A. Edwards and Leon Jordan, Kansas City, Mo.; T. H. Cohron and R. H. Monday, of Pleasant Hill, Mo.

The first day was taken up with eleven 10-target events, with optional sweeps to suit those present. Roundtree won the first general average with 78 out of 110, and he had the pleasure of having his board bill paid for two days, while Milligan won the hunting coat and Edwards a box of cigars.

The second day was the most interesting, as a number of valuable prizes were listed, viz.: Marlin shotgun, Ithaca hammerless, Hunter Arms Co. challenge trophy, Rawlings Sporting Goods Co. and others that caused the competition to be exciting.

The champion from Dayton, O., Deaton, proved much too strong for the others; yet he did not capture either of the gun prizes, as Lawry won the Marlin and Crockett the Ithaca. He, however, ran away with the championship with 42 out of 50, being 5 to the good over all. Then to show what he could do, made a straight in the last event. Hailing from Dayton, no doubt, he has often watched the "Daddy of 'em All" smash 'em up, as he has the quick, snappy way that makes target smashers who win. Scores follow:

Sept. 22, first day.—Shooting at 110 targets, eleven events of 10 targets, the totals were: Tucker 40, Edwards 70, Johnson 65, Monday 62, Willis 55, Jordan 66, Crockett 61, Roundtree 78, Cohron 65, Milligan 77.

Sept. 23, second day.—The programme had a total of 190 targets for this day.

	Shot at. Broke.		Shot at. Broke.
Tucker	165 96	Jordan	155 103
Edwards	190 96	Mulligan	190 125
Willis	190 122	Monday	165 82
Crockett	190 122	Deaton	190 161
Johnson	190 116	Mosie	165 81
Cohron	190 110	Lawry	165 110
Roundtree	190 130		

Webb City Tournament.

Webb City, Mo., Sept. 22.—The new gun club held its first shoot on Thursday at the grounds south of town. The club starts well, and a club house will soon be erected that will accommodate all who may attend. Some fair scores were made, while others can improve. B. Gammon made 24 out of 60, J. J. Gettinger 29 out of 50, C. E. Jones 25 out of 50, Al Dixon 43 out of 50, Herman Jones 26 out of 60, Teddie Brevier 33 out of 70, Bass George 40 out of 70, Phil Gray 30 out of 70, Cook 0 out of 10, Bob Jones 21 out of 70, McLoughlin 43 out of 60, McCormack 6 out of 30, Hamilton 21 out of 40.

Guthrie Tournament.

Guthrie, O. T., Sept. 17.—The Neal and Harris tournament, although not largely attended, was a success in every way. Shooters were present from Kansas, Missouri, Oklahoma, Indian Territory and Texas. The trade was represented by Hubby, Sharp, Faurote, Aughtrey. Jim Head was present also, but he had too much business in town to spend much time at the shooting grounds. The shooting was somewhat difficult on both days owing to the high wind, and the shooters were kept busy figuring where to put their shot charge so the targets would duck into it. The high average the first day was made by Boston and Huston, Faurote second and Reust third. Faurote made high average the second day, Hubby second and Harris third. For both days Faurote was high man, Reust second and Hubby third. The White trophy event was warmly contested and resulted in a tie between L. R. Owen, of Cushing, and T. B. Newton, of Skedee, each breaking 48 out of 50 targets. Owen won trophy in the shoot-off.

Silver City Tournament.

El Paso, Tex., Sept. 22.—The shoot at Silver City, N. M., was a good one, most of the scores averaging well. The interest was centered in the team shoot, five men from El Paso, Tex., composed of Rand, Burdick, Hitt, Campbell and Shelton. The Silver team was Farnsworth, Loyne, Carter and Powell. The second and last events counted on the \$150 cup, and the El Paso boys report having been entertained so grandly that they could not shoot their best. Rand, 166, and Burdick, 161 out of 175, were high men of the programme.

Missouri League Tournament.

Moberly, Mo., Sept. 24.—The sixth tournament of the Missouri League of Trapshooters was held Sept. 22 and 23, with fine weather, but light attendance. It would seem that the border towns would have been represented, and there are many good towns near by in the center of the State where good gun clubs used to flourish.

The manufacturers' agents were quite numerous. Billy Heer, M. Sharp, Tom Marshall, Charles Spencer and W. H. Viemeyer.

The scores show that Bill Heer had to get very busy on the last day to beat out Marshall for high average. Spencer, Holland and Thomas made a tie. Dr. Clapp could not hold up the second day, as he was busy with the management.

The high scores for those who shot through the two days' programme, 400 targets, were: Heer 384, Marshall 380, Spencer 363, Holland 363, Thomas 363, Clapp 355, Dr. Hickerson 338.

In Other Places.

San Francisco, Cal., Sept. 20.—The weather man was good to us on the coast when it came to the last shoot of the Golden Gate Gun Club, of Ingleside. Of course, the finals were hotly contested in each class. The Bekeart challenge cup brought together Nauman and Webb against Holling. Each man a tie on 92. In shooting off the tie, Nauman outstayed the others. Out of 50 he got 49, Holling 47, Webb 44.

Information is at hand to the effect that on Oct. 2 the Corner Rod and Gun Club, of Fort Wayne, Ind., will open the fall shooting season with a 50 live-bird match between Hugh Clark, of Wabash, and Max Witz, of the home club. This will be the opening match on the new grounds, where in the future many of the principal shoots held in the State of Indiana will take place. This large club will exert an influence which will serve to bring the rusty guns from their neglected places, and good matches will result in the near future.

The Trenton, O., Gun Club held a shoot Sept. 28. J. Haaman, of Hamilton, was official scorer, while H. Schoenfeld is president. J. H. Keer is secretary and H. Goebel treasurer of the home club.

The Serena, Ill., Gun Club has a membership that most large cities would be proud of. The last shoot at Cedar Stock Farm was a great success.

The Houghton, Mich., Gun Club held their annual meeting on Thursday night and officers were re-elected for the coming year: J. H. Rice, President; R. M. Edwards, Vice-President; J. M. Vivian, Secretary; F. I. Cairns, Captain; Members of Executive Board: John C. Pryor and J. J. Lealand. President Rice has donated a cup to competition. The invitation is extended to all shooters to join in the weekly shoots.

W. D. Harlow was the winner of the club trophy on the occasion of the last meeting of the Kalamazoo, Mich., Trapshooters' Association, as he broke 35 out of 40. Taylor was second with 33, and Den Bleyker third. High average for the season wins the cup.

J. K. Thibault, W. B. Miller and Col. J. A. Woodson, members of the Capital City Gun Club, Little Rock, Ark., will on Sept.

30 contest against George Clements, Eugene Arnold, of the Pine Bluffs. A goodly lot of new members has been added to the Little Rock club, viz.: W. T. Tyler, Geo. Hershman, J. W. Bressler, J. C. Moore, W. E. Taylor, H. L. McFarlin, A. T. McMillan, J. E. Joyce, G. A. Harvey, E. C. Bagley, H. W. Morrison, John W. Dickinson, J. and J. W. Batch.

The Dayton, O., Gun Club has leased the Rudy track, and will fit up grounds, where every Friday those fond of the recreation of shooting at the traps will be made welcome. A tournament will be held Oct. 6 and 7.

Robert A. Marks, of Springfield, Ky., has been appointed game warden, and announces that he will prosecute violators under the new law.

Jack Rabbit and per cent. systems will both be used by the Dayton, O., Gun Club, for the tournament to be held Oct. 14.

The second shoot of the N. C. R. Men's Welfare League was held Saturday. During the week another trap was set up, and now all the shooters can be accommodated.

The Houghton, Mich., marksmen have signified their willingness to match shoot with any other club in their county. It is yet a question as to who will knock the chip off the shoulder.

The Reed City, Mich., trapshooters have organized a gun club, and shooting meets will be held.

"Now on and now off" was exemplified in the match with Indianapolis, wherein Crawfordsville lost. Cook, who in the first shoot made 48, fell to 31, and thereby lost the match by 6 targets. Cooper with 46 was high for Indianapolis, and Uncle John Detrich, with 45, was high for Crawfordsville. Stillwell, Long and Voris shot well enough to win, but Snyder was almost as bad off as was Cook. There is a difference between shooting over magautrap and the expert.

The North End Gun Club, of Port Huron, Mich., has been resurrected, and shoots are now on for the fall season.

It is almost a certainty that there are no clubs in Tennessee strong enough to beat the Hermitage, of Nashville, not so long as Andy Meaders can smash 99, Watkins 93, Legler 90, Armstead 87, and Chas. Arx 87. Gallatin club tried it last Thursday, and though Harris made 93, Carr got 86, Frazer 83, Morrison 80 and Baber 79. Meaders was so much in form that his total score for the day was 124 out of 135.

Wm. Overstreet and Clem Brown have challenged Jim Lewis, Owensboro, Ky., Gun Club, to shoot a match for the medal. Lewis made 42 to Overstreet's 40 during the last contest, while Brown made 39.

Frank Bills is holding up the reputation of Sioux City, Ia., as a shooting center, as on his last attempt he lined out 71 out of 75 targets shot at.

E. J. Shirliff, game warden at Kilbourne, Ill., has issued warrants for W. R. Baldwin, of Delavan; H. J. Pattenbaugh, of Mackinaw; Edward Mcobery, of Armington; H. J. Dadds, of Morton, and John Ramsey, of Manito, all wealthy citizens who are accused of shooting between sunset and sunrise, contrary to law.

At a meeting held in St. Paul, Minn., a new gun club was formed. It is the Minnesota River Gun Club, with Capt. Whipple as President; J. H. Odell, Treasurer; Harry Goodson, Secretary. The preservation of game birds and fish will enter very largely into their activity.

The members of the Little Rock, Ark., Gun Club are raising a fund to purchase a glass eye for the boy who lost his eye while working at the traps.

The Fort Harrison Fishing Club held their meeting at Terre Haute, Ind., and elected officers as follows: Christian Morlock, President; Chas. Hocker, Vice-President; Frank Fishbeck, Treasurer; E. H. Mullen, Secretary; Fred Ellenberger, Charles R. Carter, Michael Jacobs, Trustees.

During June, July, August and September the Dubuque, Ia., Gun Club held shoots. At the close of 1904 season the Class A was won by E. M. Jaeger; Class B, Ed Ryan won; Henry, Michael and Ryan were tied up to the last shoot. J. J. Murphy won four times. Those who won B and C will go up to A and B for 1905. The club members were active during 1904, and all went well.

C. F. Gilstrap, of Taylor Gun Club, will manage the shoot to be held at Bryan, Oct. 19 and 20.

The directors of the gun club at Bloomington have selected E. K. Crothers, James Gray, T. Rabbourne, Edward Howard, Clark Gideon and Howard Steele as a committee to look after the prizes to be distributed at the Oct. 19 tournament.

Will Redderson distinguished himself by making the only straight score at the Hutchinson, Kans., club shoot on Saturday last. Five events were shot off, and contests were exciting.

Tom Casetty, of Nashville, Tenn.; Harold Money, from all over; Tom A. Marshall, of Keithsburg, Ill.; W. H. Heer, of Concordia, Kans., and E. G. Wallace, of Marshalltown, Ia., were visitors at the World's Fair during last week.

N. R. Huff, secretary of the old, but still progressive gun club of East St. Louis, Ill., writes that their last tournament was a failure owing to rain. The next attempt will be that of Oct. 30, which will be just before the World's Fair Handicap.

The Lake View Rod and Gun Club, of Calumet, Mich., is taking an active part in the enforcement of the game laws, having employed a man to patrol the woods in search of game law violators. This might serve as a reminder to other gun clubs that such actions greatly assisted the game wardens in their work.

And now comes Routard, Ill., one of the latest to get into the harness, as an interesting shoot was held last Tuesday. This will be repeated monthly.

What was fully expected to be the best live-bird shoot held in northern Illinois was held at Oak Park, Tuesday of this week. The second annual shoot of the Blackwell Gun Club will be held Oct. 26 and 27, with \$200 added money. Urban Tracey, secretary, and Chas. Cornelius manager.

The Juneau, Wis., Gun Club has hung up an \$18 medal. The entrance fee will be 50 cents, and should any one win it three times in succession, the medal becomes his property.

Ernest F. Scott, captain of the Dalton, O., Gun Club, has forwarded a programme for the Oct. 6 and 7 tournament. It provides for a good time, with all manufacturers' agents shooting for targets only. The events are all 10 and 15, there being a total of fifteen.

A friendly match was shot at the town of Quincy, Mich., Saturday. The prizes were numerous, being cash and merchandise. The team shoot was a hot one: Girard scored 57, Quincy 55, and Coldwater 54. All present reported having had a good time.

The East Saginaw Gun Club held a shoot Sunday, and there were indications that the attendance was very large. Many prizes were up for competition.

W. J. Rand, Will Peck, Stafford Campbell, G. L. Hitt, mem-

bers of the El Paso, Tex., Gun Club, attended the shoot at Silver City.

Twenty prominent men of Marion, Ind., have organized a gun club named Sterling. Some of them are good shots and will show up well at the traps. Harry McClellan is secretary.

Waverly, Ia., Sept. 22.—The shoot held here yesterday was well attended. The scores were low. This will be best accounted for by the cloudy sky, a wind and a dark, deceiving background. Expert traps and bluerock targets were used, and the management was first class. Those in charge surely were made to feel the appreciation of those present.

C. W. Budd and F. H. Lord, with 109 out of 120 were on an equality as to target busting. Robert Jackson came next with 107, as high amateur.

Garfield Gun Club.

Chicago, Sept. 24.—The appended scores were made to-day on the occasion of the first trophy shoot of the fourth series. Kamp won Class A trophy on 23, Dr. Skillman Class B on 13 and Dr. Reynolds Class C on 20.

In the cup shoot, which followed, Thomas won Class A on 21, Cook Class B on 16 and Dr. Reynolds Class C on 16.

Owing to the threatening weather and the fact that very many of our regular shooters are now in pursuit of the elusive duck and the wily jacksnipe, our attendance was not up to where it should be, only ten members showing up for the occasion. Another application for membership received to-day, making fifteen on the waiting list.

Cup shoot, 15 singles, 5 pairs:

Dr. J. W. Meek, Sec'y.

Cincinnati Gun Club.

CINCINNATI.—The attendance on Sept. 24 was not so large as usual, fifteen shooting in the cash prize event. The weather conditions were bad—cloudy, poor light and strong wind from the right. Pohlar and Peters tied for first on 46. Tuttle finished second with 45.

The last shoot in the Parker prize gun series will be shot on Oct. 1, and the shoot-off of ties will take place on the 7th. There will be ten men in the shoot-off, and their handicaps will be adjusted according to their per cent. in the series.

In the cup race there are fifty-four entries. Peters, Gambell and Medico still lead with 24 each. No scores were shot for the cup to-day.

The shoot for the Phellis trophy is off for the present. Supt. Gambell received notice from the Dayton Club that they could not shoot on Sept. 28, but would name an early date.

Mr. F. Tuttle, of the Peters Cartridge Co., has just ventured from a trip to the Adirondacks, where he had some fine pickerel fishing. His trip did him good, judging by the way he broke them to-day.

Tuttle and Peters shot a match at 25 targets each, against Keplinger, Myers and French. The latter team won by 47 to 35.

Supt. Gambell met with quite a serious accident on the 22d. No bones were broken, for which he feels grateful, and considers he was in great luck; but he will be laid up for a week or two.

Cash prize shoot, 50 targets, distance handicap: Pohlar (18) 46, Peters (18) 46, Tuttle (16) 45, Faran (21) 43, Williams (18) 42, Block (18) 41, Sycamore (19) 40, French (16) 40, Keplinger (16) 35, Falk (18) 34, Jay Bee (17) 34, Pfeiffer (16) 34, Ackley (16) 33, Lytle (16) 23, Meyers (16) 23.

Notes.

The Richmond, O., Gun Club held their tournament on Sept. 20. The small attendance was a sad disappointment to the officers and members, only twelve shooters taking part. Carl Allgower is president and R. W. Lenox secretary. Both of these officers, aided by the members, have worked hard to make the club a success, but they have never been able to have a largely attended tournament. The club, while shooting as an organization, will give up their grounds and return their trap. Rolla O. Heikes was high with 185 out of 200. J. H. Jennings second with 184. S. Cushman third, 177. R. W. Lenox, the secretary, was in good company, and finished fourth, tying with R. L. Trimble and D. D. Gross on 172.

At the regular shoot of the Sandusky, O., Gun Club on Sept. 17, F. Schnatter, Jr., was high with 24 in contest in the scores for the Cedar Point cup, and leads in the aggregate score to-day with 157.

The Hamilton, O., Gun Club held their fourteenth trophy shoot on Sept. 22. E. D. C., 44, was high, but he was not competing for the trophy. Stickels took it on 41.

The Dayton, O., Gun Club will hold its second amateur monthly tournament on Oct. 14. There will be twelve events at 15 targets each. Six of them will be jack rabbits, \$1.80 entrance; surplus divided, 50, 30, and 20 per cent. Six will be under the percentage system, \$1.50 entrance, three moneys, 50, 30 and 20 per cent.

It was expected that a team of the Cincinnati Gun Club would visit Dayton on Sept. 21 and shoot a match for the Phellis trophy with the Dayton Gun Club. When a telegram was received Sept. 24 announcing that the Queen City team would be unable to compete, a team of the Dayton Gun Club challenged the Buckeye team to defend the cup and championship title. The match resulted in a victory for the challengers by a score of 237 to 219. The trophy is for six-man teams, at 50 targets per man. The scores were: Dayton team—Lindemuth 46, Raymond 44, Rike 42, Bailey 38, Craig 37, Orth 30; total 237. Buckeye team—Heikes 46, La Rue 40, Cord 39, Schwind 37, Curphey 30, Gerlaugh 27; total 219.

Ed. Cain has so far recovered from his illness as to be able to

visit the grounds on the 21st. His welcome from the shooters was a cordial one.

Rolla Heikes attended the Evansville, Ind., tournament, leaving for that place on Sept. 22.

Daniel Stoner, Dr. J. R. Wampler and his brother Moses, all of Dayton, left on the 21st for the Dakotas and Minnesota on a hunting trip.

Bellbrook, O., is the home of the Goosetown Gun Club. This club will join the State Trapshooters' League, and then challenge the Dayton Gun Club for the coveted Phellis trophy.

The regular weekly shoot of the Rohrer's Island Gun Club was held Sept. 21. The medal shoot was won by Wm. Oldt, for the third time, after four shoot-offs. There were two two-man and two six-man team matches.

Coudersport Gun Club.

COUDERSPORT, Pa., Sept. 22.—Herewith find the scores of our two-day tournament, which took place here on Sept. 20 and 21. The attendance was small, owing to the bad weather. It rained hard the first day, and that kept lots of the shooters away. The second day was cold and windy, almost blowing a gale, which made the shooting very difficult. F. F. Mason, of Olean, N. Y., won high average both days, breaking 417 targets out of 500 shot at. Homer Elliott, of Wellsville, was second, with 394. With the weather conditions, Mr. Mason shot a very good race throughout the programme, as high winds made the targets very erratic. All present seemed to have a good time.

Sept. 20, First Day.

Emerald Gun Club.

NEW YORK.—The total of live-bird contests from March, 1904, to Feb. 1905, are here given. All were shot before the abolition of pigeon shooting in New Jersey.

Colquitt wins first average, \$20; Guenther wins second average, \$10; Reiersen, wins third average, \$5.

Whitley wins first point prize, \$15. Hudson wins second point prize, \$10. Short wins special prize donated by Capt. Reiersen, \$10.

Fischer wins special prize donated by Capt. Dreyer, \$10. Schoverling wins third point prize, \$8. Schortemeier and Koegel divided fourth and fifth point prizes of \$7 and \$5; \$6 each.

Cattar wins sixth point prize, \$5. Keim wins seventh point prize, \$5. Morrison wins eighth point prize, \$5. Dreyer wins ninth point prize, \$5.

Chasmer wins box of Havana cigars, donated by Schortemeier. May wins fancy metal calendar, donated by Dr. Hudson. Kall wins 100 loaded shells, donated by Schoverling.

Kracke wins oil painting, donated by Tom Short. The substitute for the annual meeting was held last week, when the prizes were distributed.

Independent—Allentown.

EASTON, Pa., Sept. 19.—The third and final match between the Independent Gun Club, of Easton, Pa., and the Allentown Rod and Gun Club, of Allentown, Pa., will be shot Oct. 1 at South Bethlehem, Pa., on the grounds lately completed by Mr. Acker, and situated within 30ft. of his hotel. As this match decides whether the Eastonians or the Allentonians are to be champions in this section, great interest is being taken in it, and no doubt a large crowd of interested trapshoots will be present to see the outcome.

EDWARD F. MARKLEY, Sec'y I. G. C.

John W. Gates entertained a merry party at dinner at one of the best known of the road houses out beyond Saratoga. Lake the other evening after the races. The liquid part of the entertainment furnished was not wholly Apollinaris water, and some of the men were feeling in a rather tangled condition when they left the table and started for home in the gray of the early morning. One of the lot was a horse owner with whom Mr. Gates is particularly intimate, and who would insist on trying to wear Gates's hat, which is three or four sizes too large for him. After the hat business was straightened out, Gates sang out to his friend: "I say, John, you will see two carriages out there at the door. Take the first one. The other isn't there. Good-night and good luck."—New York Commercial.

PUBLISHERS' DEPARTMENT.

Fall Travel South.

THE tide of travel is now southward bound. The Southern Railway, as usual, has its schedules so arranged as to give those going south, southwest, Mexico and California, a most delightful service. Through Pullmans are operated daily from New York, touching all of the prominent cities south and southwest. The Southern Railway operates its own dining car service on all through trains, which is of the highest standard of excellence. For full information call on or address New York offices, 271 and 1185 Broadway. Alexander S. Thweatt, Eastern Passenger Agent.

World's Fair Scenic Route.

BECAUSE of its magnificent mountain, river and cañon scenery, its famous battlefields, and points of interest, and because of its superior equipment and physical condition, providing all the comforts and safeguards of twentieth century travel, the Chesapeake & Ohio is unquestionably the most attractive route between the Atlantic Seaboard and the Mississippi Valley. World's Fair and through tickets by this route allow stop-over at Virginia

CONCERNING THE DUPPY.

HE saw a Duppy. This is without doubt the only reasonable and truly scientific explanation of the phenomenon described by our correspondent, I. H. W., in the account of his night adventure in Brazil. He has been moved to tell his story by the appearance of the ignis fatuus flickering in our Natural History columns. But the Duppy is no real ignis fatuus, although it emits a weird light and goes bobbing up and down in dark places. Some of us perhaps have scanty or no knowledge of Duppies, and may be inclined to pooh-pooh their existence; but any such skepticism is due to a neglect of early education. There are hundreds of thousands of human beings living on this earth to-day who have implicit faith in the existence of the Duppy, and to whom it is a very real and very terrible factor of the outdoor world. They have imbibed a knowledge of it indeed as a part of their A B C. For two centuries the black mothers of Jamaica have taught their children the alphabet by a set of rhymes, which, so far as we need give it for the present purpose, runs as follows, "assinoo" meaning donkey, and "buckra" meaning white man:

A is for Assinoo; see how him stan!
B is for Buckra, bery bad man.
C is for Pussy; him name Maria;
D is for Duppy; him eye shine like fire.

Early impressions last through life. The child taught to believe in the Duppy, whose eyes shine like fire, afterward sees the dreaded apparition in the dancing will-o'-the-wisp and the phosphorescent glow of dead wood in the darkness of the forest. The Duppy, Jumbi or Zombi, is known all through the West Indies; its favorite haunt is in the ceiba or silk cotton tree. Charles Kingsley tells us that in Trinidad the giant ceibas are popularly regarded as magic trees haunted by spirits; "there are too many Jumbies in him," the negro says. Wherever the ceiba is found—and it is found in Brazil—within its shelter the Duppy is sure to make convenient and congenial perch, thence to emerge in human form divine, or in shape of some animal, or as a composite apparition such as that which was seen by our correspondent, having a body like a calf and a head like a dog. One might reason that the simplest and most sensible expedient would be to exterminate the ceiba-inhabiting Duppies by destroying the trees which harbor them; but to meddle with a ceiba is just the one thing a West Indian negro will not do if he possibly can avoid it. In Trinidad it is held that if one cuts down a ceiba he is sure to die or come to some harm within the year; and in Jamaica, when a negro can be induced to fell a ceiba, he first pours over the roots a propitiatory libation of rum, and as he swings his ax, sings a deprecatory song, ascribing the responsibility to that instrument—"Me no cut you, massa, he cut you."

The ceiba or silk cotton tree is indigenous to the West Indies and Brazil, and to Africa. When the negroes brought as slaves from Africa to the West Indies found the familiar tree in their new home, naturally they ascribed to it here the same weird nature it had there, and peopled it with like uncanny spirits. Of the many shapes assumed by the Duppies of the African forests, one of the most horrid is the Sasabonsum, which Mary Kingsley describes in her "Travels in West Africa." This particular spirit lives in or under the great silk cotton trees, around the roots of which the earth is red. The red earth identifies a silk cotton tree as being the residence of the Sasabonsum, as its color is held to arise from the blood that drips off him as he goes down to his under world after a night's carnage. All silk cotton trees are respected because they are held to be the roosts for Duppies, but the red earth ones are feared with a great fear, and no one dares to pass by them or to camp near them at night. Sasabonsum is a friend of witches. He is of enormous size and of a red color. He waylays un-

protected wayfarers in the forest at night, and either eats them or sucks their blood. Sometimes a victim escapes, crawls home to describe the appearance of the Duppy, and expires. Considering what a frightful creature an African Duppy is in its native lair, and what it does to its victim, we are of opinion that the hero of the Brazilian adventure may well have thanked his stars that he got off so easily from the one he encountered, and escaped with a scare.

The horrible funk this Brazilian apparition threw the wayfarer into gives strong confirmation of the theory that it was a real and true Duppy. When a West African encounters a Duppy, Miss Kingsley says, "he is a thousand times more frightened than puzzled over the affair. He does not want to 'investigate' to see whether there is anything in it. He wants to get clear away and make ju-ju against it." This is precisely the terror engendered by an encounter in Brazil. "I was too frightened to ask the apparition or whatever it was where his wealth was stored," writes I. H. W., "my only anxiety being to get out of the locality as soon as possible, not even looking behind to see if 'el luz' was visible and bobbing."

We repeat, then, that the reasonable and scientific answer to the riddle our correspondent has set to be riddled is that he saw a Duppy. If after the evidence adduced there be a skeptic to deny the Duppy in part or *in toto*, we recommend to him to consider that in this, as in other phenomena, natural, supernatural, and unnatural, much depends on the point of view. What a thousand men cannot see in the light, one man can see in the dark. The spirit in the ceiba is, like the ceiba, a product of latitude and longitude. Negative evidence might disprove the existence of the ceiba-inhabiting Duppy, but the same sort of evidence would disprove the ceiba as well. All the negative evidence in the world would not destroy the belief of the child who has learned with his alphabet, "D is for Duppy, him eye shine like fire." He may perhaps unlearn it, but when the time comes he will learn it again. An amusing story is told by Miss Kingsley of a native minister who had been away in the Apollonia district on mission work. One evening he and a friend were strolling along a beach which was reputed to be the haunt of witches, and where the night was so dark that only the surf breaking on the shore was visible. They saw a flame coming toward them; after a minute's doubt knew it was a witch, and feeling frightened, hid themselves among the bushes. As they watched, it came straight on and passed them and disappeared in the distance. "My informant laughed at himself," adds Miss Kingsley, "and very wisely said, 'One has not got to believe those things here; one has to in Apollonia.'"

THE OUTLOOK FOR GAME.

We continue to-day the "Notes from the Game Fields," of which the first installment was printed last week. These reports, in response to our inquiries, have come from a very wide extent of territory; indeed, they may be said to cover the game regions of the country. They have been sent to us from game commissioners and game wardens; they are official, and may be accepted as intelligent and authentic. And they make a remarkable showing; for with barely an exception they tell of an increase of game and a good outlook for the season's sport.

Reading between the lines, one may find in them what is more significant and gratifying and important than the mere condition of the game supply. It is the growing popular sentiment which in larger degree than ever before approves and sustains the game protective system. This is something which was certain to come with time, and with the showing of results. Once achieve a condition wherein the fruits of protection are patent, and its benefits demonstrable by the actual substantial evidence of a fostered game supply, and at that moment the battle is won, opposition is disarmed and public support is assured.

The one feature of the modern system of game protection which has been more effectual than any other, or than all others, to save and renew the game supply, is the prohibition of the sale. The present prevailing favorable condition of the game covers is in large measure a direct result of the adoption of the FOREST AND STREAM Platform Plank that "the sale of game should be forbidden at all seasons." If ever there was a triumph of an idea, there

was one here. Proposed at a time when the marketing of game was practically universal—provided there was any game to sell; and when it was conjectured even by the most strenuous advocates of the idea that a realization of it could not be expected for many years to come, the principle is now universally recognized as basic in any sufficient system of protection.

But game laws aside, and beyond all human agencies, there are certain influences and conditions which make for or against the game supply of a season; and of 1904 we may say that it is a good game year, just as we write of a good apple year or a good wheat year.

RAILROADS AND ILLICIT GAME TRAFFIC.

IN a communication of a North Carolina correspondent in our last issue, renewed attention was called to a common evasion by railroad employes of the laws which forbid the export of game. The northern demand for quail for hotel, restaurant, club and private tables, is so great that all sorts of tricks and expedients are resorted to by the shippers to get the birds across the State lines. One way is to enlist the agency of train crews, who receive the game in one State and deliver it in another. This has been going on for years; but there is no excuse for its continuance. The railroad officials have the matter wholly in their hands. They can put a stop to the illicit traffic at once and completely, and there is not the slightest question that they would take the necessary steps to do so if their attention were called to the subject and the facts were put before them. The proper course for an individual who may have cognizance of illicit game transportation by railroad employes, would be to communicate directly the facts to the higher authorities of the road implicated, and we much mistake the temper of the officials if the result would not be a speedy correction of the abuse. Train crews are employed to run trains, not to act as fences for a contraband traffic.

PEBBLES OF THE PAVE.

A GANG of pavers is paving Broadway. They set the heavy granite blocks in place carefully, but not too carefully, nor without circumspect appreciation that another paving contract in the not remote future is among the things to be hoped for. The cracks between the stones are filled with pitch and gravel. The heaps of gravel allure the small boy. A youngster stuffs his pocket with pebbles. They are good to throw at cats. That night he bombards the cats, and there is an end of it. Another boy fills his pocket with pebbles. They interest him. He notes their shapes and shades, and wonders at them. His curiosity is aroused. He wants to know all about them, where they came from, how they were formed, the where and the why and the how of it. He studies up the subject. The study gives him a taste for geology. Eventually he becomes a mineralogist, discovers a gold mine, and dies a millionaire. This story shows by what trifling incidents our lives are governed. It also indicates the difference in boys. It is, moreover, a true story as to the first boy; and as to the second boy, except that he has not yet been born.

POISONS IN THE FIELD.

Three species of laurels are injurious, chiefly to sheep and cattle, and not always to them, though they have a bad reputation. Chickens which have fed on laurel leaves are said to absorb the poison, and, if eaten by human beings, to be very dangerous. Occasionally one hears of ill effects resulting from eating a grouse that has fed on laurel leaves, but we do not know that anything has ever been done toward investigating the effect of this food on the flesh of wild game. Honey made from the flowers of the laurel is said to be poisonous.

Jimson weed is common about cities in vacant lots, and in the country growing at the edge of the barnyard. It is a large, rank plant, with white flowers three to four inches long, reminding one a little of the morning glory. The seed pods are four-valved, prickly, and contain a great number of seeds, at first white, but as they ripen growing brown, and finally changing to black. Children are poisoned by eating the fruit, chewing the stems, or sucking the flower.

THE SPORTSMAN TOURIST

On the Tundras of Siberia.

WHAT are termed "ball-fields" by some, are termed by the native Cibriaks, "tundra." To the American mind, "ball-fields" is the most expressive term. For if you have had a walk of thirty miles over one ball-field stretch in a single day (and the writer has had many such), you will have a knocked-out feeling by camping time that will make you think you have had enough for a month. But when it comes to having to resume on the morrow—and on the morrows for an entire week—that infernal walking-jolt over the ball-fields or marshes, you get all the "ups and downs" of life in that week sufficient to serve for the "hard time" memories of a career. For one week of this harassing ball-field stumping is literally a mental strain on the tourist. Then there are the trillions of mosquitoes which follow you, obliging you to cover up the entire body, which naturally increases your body-heat to an enervating degree. Even so, the insects will settle on your back, and bore their proboscis through both coat and shirt, and still draw blood!

The Cibirian mosquito is probably the biggest in the universe. It is three times larger than the New Jersey pet—or pest. Flattened down on a half-dollar piece, its lanky legs will just reach to the milled edge. It is a light nut-brown in color; and they make no attempt to escape from the descending hand, which crushes them by the dozen as they settle on the exposed skin.

Cibirian mujiks, when intoxicated and asleep in the

a house, or in the darkened barns or stables, bristling nearly all over with gently-crackling luminous electricity. It sometimes resembles a miniature pyrotechnic display—like hundreds of tiny fireflies shedding their momentary scintillations of sparking light.

The Cibirian trapper has probably the only really waterproof clothing in the world. It is throughout pure wool, undyed, yet a dull brown-black, inasmuch as the black-fleece wools are alone used. It is a home-made knitted fabric, yet so close-stitched you can't see daylight through it; consequently, it is elastic, and lasts years, although not an over-thick material—weighing about one pound to the square yard. It is unobtainable commercially in Cibiria; to get it, means a hunt to the villages to purchase a few yards—if they are disposed to accommodate you. Nor can it be procured in any other country of the globe—to the writer's knowledge.

As a traveler who has had fifteen years of outing experience, in most every country of the universe, I have tried every conceivable kind of waterproof clothing, but found the rough Cibirian all-wool goods the sole satisfactory article. Rubber is unhealthy, because non-porous; hot and evil-smelling in summer, and icy-cold to the touch in winter—unless faced with wool. Moreover, it can never be relied on; it is always liable to "go" unexpectedly—the rubber oxidizes, crumbling into sand-like particles. This is particularly true of the one-side-rubber-faced silk overcoating.

Oilskins, mackintoshes, pantasote, are all unhealthy

proofing does not even possess capillary attraction. You, of course, know what capillary attraction means, when, after a long day's outing in the rain, you become conscious of the wet creeping up the inside of your coat sleeve (begins to rain even up your sleeve), and it may even reach the elbow ere nightfall; just as, if not wearing long boots, the wet will gradually capillate up the interior of your trousers to the knees, or even to the groin, despite the rubber coat which reaches almost to your ankles. This capillarity is due to the heat of the body drawing up the moisture. But the mujik's recipe for waterproofing even bars out the capillarity.

The native name is laha, or cholk. It is extraordinarily strong, as may be judged by this fact, that one of those overcoats, buttoned up, and two slim poles run through the interior, often serve for a hammock, laid on a trestle or a couple of forked boughs, and the 200-pound mujik trapper will snore comfortably thereon till morn. Examine the coat next day, and you will find not even a seam has started; but there are only three seams in the whole garment; hence its strength. Then the mujik breaks camp, dons the coat that was his bed, and literally goes off "with his bed on his back" all day.

But the Cibirian cholk has its fault even. It has been said it is porous; so it lets the dread, searching arctic blasts filter through, more deadly, if unchecked, than any rain; for death from exposure (sheer loss of animal heat) is liable to supervene. I have been twice nearly that way myself in central Cibiria.

So to keep out the polaric blasts, the Cibriak wears the chyba or skin furs, through which no air can go; or the

ON THE TRANS-SIBERIAN RAILROAD.

forests, have been known to sleep and never wake again. Millions of mosquitoes had settled on them, and had drained them of blood till exhaustion and death ensued. I got this information from Russian medicos themselves, who, making an autopsy of the bodies, found them bloodless.

The ball-fields, or tundra, are formed by the workings of the rainfalls of centuries on flat expanses. The grass grows for ages in rank growths; and the water, in following the law of gravity till it reaches the river, meanders over and about the field, trickling through the long rotting herbal growths of former years. In course of time, the erosion wears channels between the grass-tufts, which are gradually added to every year, till they reach a height of one and a half to two feet above the waterline of the marsh. In time, again, these become top-heavy, rot at the base, and fall over; or the tramping sportsman, putting his weight on one, often hastens the fall. This tuft sinks into one of the narrow channels, and finally makes the peat of coming generations, while another ball begins to form in its place. Thus is the genesis continued.

In stumping or stalking across tundra, you have the option of stepping from tuft to tuft, or of sinking knee-deep in the boggy little channels encircling them. You feel "between the two devils," but decide on the lesser evil—from tuft to tuft. And as you step from ball to ball, you may miss, or a rotten one will cave over, and the heavy lunge will send you sprawling ignominiously, with the marshy water dashing up into your face and neck. Such is the camping-outer's experience of the ball-fields, or tundra, of Cibiria!

A graceful, domestic feature of Cibirian farmhouses, are the long-haired pussies—hair so long that you can sink and run your fingers through it, so you cannot see them. This is a wise precaution of nature against the intense wintry cold of half a year. The cats are exceedingly affectionate-natured, and love to be fondled, and to lay on your breast, with their fore-paws reaching half-way round your neck.

In the mid-winter, during the extremely dry cold weather, you can see them in the dark passage ways of

and uncomfortable, because non-porous, and icy-cold to the touch in winter. They are also very noisy brushing through the still forests; and no hunter has any use for articles that will frighten his quarry.

The woolen and silk goods, known as "cravenet," are really not waterproof; they may turn off a slight shower, but rainfalls are seldom so gently accommodating. When it rains "cats and dogs," the hydrostatic force of the descending torrents literally hammers the rain through the "cravenet," and in half an hour you have "all the starch" taken out of you. In the thickest winter-weight cravenet, even (22-24 ounces to the square yard), the pelting rain will finally hammer through, and completely soak the coat. Then you have the further discomfort of knowing you are uselessly carrying around a half-dozen pounds of water soaked into that supposed "waterproof." For by actual test, I have found that a 9-pound winter waterproof, after being out in it all day on the go, in the alternately drizzling and pelting rain, weighed by evening fifteen pounds. Hanging up in the tent, it took five days to completely dry out.

The secret of the Cibirian really waterproof pure wool clothing, is that it is made up of merely lukewarm-water-cleaned long-fiber wool, but not scoured, so that much of the lanolin, or "cyok," remains in the wool and preserves its strength, and even moths won't harbor in it. Then, after being as close weave-knitted as the primitive frames of the villagers will permit, it is placed for a couple of days in an almost neutral pickle, which serves a double purpose—shrinks the cloth (corresponding to our sponging), so that it may be washed hereafter with a minimum of shrinkage—is that—and, most important of all, insolubilizes the lanolin in the wool so that the whole texture becomes water repellant, and the coat does not even allow any rain to spread or saturate on or in it; the water simply "beads" off as it falls. Therefore your coat is always dry, with the exception of pin-head-like particles of rain which lodge in the roughnesses and interstices of the cloth, but which drop off on shaking your coat—as sea sand drops off a handkerchief which has been laid thereon to dry.

In other words, the ideal Cibirian all pure wool water-

much lighter kleunka, a black, oil-dried waterproofing, which is entirely wind-proof, but, if you are standing about, as poor an insulator against cold as rubber boots.

The leather, chamois, and canvas coats you see in America are never seen in Cibiria, and no sporting goods stores in any of the towns would handle them. They are all too icy cold for the climate; 40 degrees below zero, on and off, for months, seems to stiffen them with an extra penetrating cold.

The most concentrated article of wearing apparel the Cibriak wears is his chapka—a sort of forage cap somewhat resembling our own various named negligé caps used on long distance train riding. It can be used as cap, night-cap, gauntlet glove, cuff, socks, mitten, waist belt, bathing drawers, satchel, hammock rope, and maybe for three or four other purposes. It is woven circular, all wool, both ends open, and its use as a hammock rope, sustaining a 200-pound person all night, is its limit before it can be used successfully for another duty; for the heavy weight has stretched it nearly treble. But, to overcome this, the mujik just uses that provisional hammock rope instead of a flannel when he takes his morning face wash; this at once shrinks it to normal. He presses the water out between his vise-like, horny hands, and dons the cap while still quite humid. In summer it is dry in about three hours; in winter, after three minutes in the open, it freezes rock-hard on his head, but of course without adhering to his usually naturally greasy shock head of hair, and will be dried out by the intensely dry cold in about four hours.

A peculiar institution Cibirian is for a native, if wanting to make a thin overcoat both cold-proof and wind-proof—to provide for an emergency of a few hours, maybe—to soak it for about five minutes in warm water, squeeze (never wring) all the water out possible, put it on, and walk out into the cold. It promptly freezes stiff as a board about him, the ice filling all the pores, and effectually barring the most searching winds. This will suffice for an outing of four or five hours, the proofing gradually disappearing with the evaporation of the coat of icy mail, by which time the wearer calculates to be back home again.

L. LODIAN.

Santa Cruz.

Out in the sea, some twenty-five miles from the coast of southern California, lies a chain of islands: Santa Miguel, Santa Rosa, Santa Cruz, and Santa Anacapa. The largest, and by far the most interesting of the four, Santa Cruz, is directly opposite the beautiful old town of Santa Barbara. It is about thirty miles in length and eight miles wide, and along its central portion rise some rugged brown peaks to an altitude of 3,700 feet. Some of the mountain slopes are covered with fine pine forests, especially along the central portion of the island. On the western end there are groves of live oak and manzanita; the eastern part is a succession of grassy, rolling hills.

Once upon a time a now extinct tribe of Indians owned Santa Cruz. For a very long time they had lived upon it, and defended it, repelling the attacks of tribes from the mainland and from other islands, too, perchance. All the surrounding tribes must have coveted it for its noble forests and the wealth of sea-food along its shores.

But one day there came a new foe; these were men with bearded faces, and they sailed in large canoes with wings, and they had dreadful weapons, which

neat little cottages. In front of these a grassy lawn slopes gently down to the edge of the cliffs. So one has here the bracing salt sea air and also the resinous odor of the pines. Moreover, the most timid may here make his bed close to mother earth, or confidently explore the caves, the thickets, the nooks and crannies in the rocks, for no rattlesnake, nor scorpion, nor centipede has ever been found on the island. Neither are there any mosquitoes, nor other poisonous insects. The cactus flourishes here in places, and in this latitude, and even further north out on the plains, wherever this prickly plant is found the rattlesnake is also; why the reptile is not here with it is an interesting question. It is found on Catalina Island, and centipedes also, and that island is even further from the mainland than this one. Santa Cruz, however, impresses one as new land, a recent upheaval, geologically speaking; the soil is not deep, except where the shell heaps of the ancient inhabitants have turned it into a rich black earth. Most of the mountain peaks are bare, brown, volcanic rock; the east end is stratas of clay and sandstone. The pines are nowhere of more than a foot or eighteen inches in diameter, nor are there any old prostrate patriarchs such as we are accustomed to find in almost any wild forest. There is no trace of a fire ever having

the dark and menacing hole in the cliff. Presently one of the party fired a gun, which sounded very faint and far away; and in a moment or two, alarmed at the report, out came a great drove of stellar seals, diving and alternately leaping into the air. They kept close to the cliff wall, heading west, and right opposite us and directly in the way of their course was a huge rock rising a little above the sea; over this they shot, high in the air with tremendous speed, affording a most interesting sight.

It was now our turn to go in. As the boat entered the lofty ante-chamber, the writer at least felt as if he were leaving the bright and sunny world on a voyage into a dark and unknown country; as one of the party put it, "The place is dreadfully fascinating." First, as to the entrance chamber: It is about forty feet in height, one hundred or more in length and dome-shaped. Well is it named the Painted Cave; yet a better name would be the Cave of Wondrous Tints. From the water's edge to high tide mark the walls and the barnacles which cover them are of a pinkish or crushed strawberry color, and this band merges into a delicate shade of green, that into faint yellow, old ivory, gray—oh, many, many shades of many colors, which this pen cannot describe, which no artist, not even the greatest, could hope to portray. The chamber, with its fairly high and wide entrance, has just enough light to give effect to the wonderful coloring.

All too soon the oarsman allowed the boat to go on, stem first, in a current setting in through a Moorish arch in the rear of the chamber. We passed it and saw other arches, all of the same peculiar style, as if carved by the ancient Moors; and beyond them all was blackness, intense, deep night. There was quite a stiff swell from outside, and Capt. Prescott deemed it unsafe for us to venture further in. Nor did many of us care to do so. Away there in the depths of the cave we could hear the water gurgle, and hiss, and roar with hollow and chilling reverberations. And there was the swift current rushing on. At high tide and low tide, and at all times, says the Captain, it is always the same, constantly running in. Where does it go? What is there far away where we hear the uneasy waters? No one knows; the black tunnel may pierce the very heart of the island, or perchance take one to the regions of the damned. "Once," said the Captain, "I went in so far that the daylight at the entrance seemed to be about the size of a pint cup. I had no lantern. Far away I could still hear the water boom, and a lot of seals were roaring, too. Even if I had been provided with lights, I should have ventured no further in that boat. What one wants for exploring this place is a narrow skiff, rigged for sculling at each end, and men with plenty of courage to handle it. I believe we are soon to have such a craft."

Rowing back, we stopped again for some moments in the ante-chamber to view the wondrous colors, and then returned to the sloop. No one, I imagined, who sees the place is likely to forget it. The fascination of it constantly returns; insistently returns; one wants to know what is beyond, where that dark passage leads to in which the current runs so strongly. Well, maybe we will learn some day.

On our homeward way we dropped the anchor just around the eastern end of Cape Valdez, and went ashore, landing on a pebbly beach in the great cave which honeycombs the high black lava point. Leaving

A SEAL ROOKERY ON SANTA CRUZ ISLAND.

belched fire and smoke with a noise like thunder. They came, however, under the guise of friendship, and persuaded the islanders to go with them to the mainland, where, it was promised, they should be protected from warring tribes, and live in peace and plenty. And so, the childlike people, having faith in the alluring inducements set forth, forsook the home of their ancestors. But alas! for the promises; no sooner were they settled under the shelter of the long-robed men than they were made to toil with heavy implements in the hot sun, and to worship strange gods, and to do many irksome things for which nature had never fitted them. And did any rebel at this treatment, they were taken in one of the winged canoes back to the island and landed in a harbor, which their masters named Prisoners' Bay; to this day the lovely cove bears that ominous name. But it was only men who were thus marooned; and, longing for their wives and children, heart-sick and in despair, they pined away and died. And those on the mainland also dwindled away. Year by year their numbers became less, until finally the very last one lay down and breathed no more. Do their shades curse the cross? Oh, the streams of blood that have flowed; the anguished cries of defenseless women and babes, that have rent the air under the shadow of that fateful cross! From Peru up through Central America and Mexico, even to these lovely islands, what terrible crimes were committed in its name.

Like the rest of the islands and much of the adjacent mainland, Santa Cruz was granted to some favorite of a Spanish King in the seventeenth century. Since then it has been bought and sold a number of times, and is at present owned by a French-Italian family of San Francisco. It is a principality in itself. Upon its hills graze twenty-five thousand sheep and several thousands of cattle; sheep that are never herded except to the shearing pen and shipping wharf; fat cattle that any grazing section would be proud of. And so rugged and inaccessible are some portions of the island that many of the sheep never see the inside of a pen, and become as wild as their distant cousin, the bighorn. They can be told at a glance, for they have long tails! About the ranch house, where live the Italian and Mexican laborers, are the vineyards and groves of fruit and walnut trees. Last season the vineyard produced 127,000 gallons of wine!

Since the island passed into Spanish control, its several owners have never until recently allowed any one to camp upon its shores or explore the interior, with one exception. In 1879 there came a scientist from France, who obtained permission to board for a time at the ranch, and collect Indian relics and various specimens of the island's flora and fauna. Among other things, he got together more than one hundred human skulls, some with flint arrow points imbedded in them. And then, one day, he sailed away, promising to send the amount of his bill, and requesting his collection to be forwarded to him. But the money never came, the skulls were finally buried, and the rest of what was undoubtedly a very valuable collection disappeared as such things will unless properly cared for.

But there is now a new order of things on Santa Cruz. Mr. A. G. Fraser, an old-time southern Californian, has finally succeeded in obtaining a concession from the owners, permitting him to open a resort for tourists and anglers, and to rent camp ground, boats and other things to those who cannot afford or do not wish to patronize the inn and cottage he has built on Pelican Bay. "Pelican Bay Camp," as Mr. Fraser calls his plant, is a lovely place; the inn is built on the edge of a wave-washed cliff, and upon a hill back of it, in the shelter of a pine and live oak grove, stand the

swept them away, and it is reasonable to conclude that the growth has not flourished here very long.

Upon arriving at Santa Barbara, the first thing the tourist hears of Santa Cruz Island is that it has some wonderful seal caves. And, indeed, they are all that, ranking not least in the list of California's very many and unique places of interest. The Yosemite Valley is stupendous in its proportions; the Seal Caves of Santa Cruz are—well, I will try to describe them.

We left Pelican Bay in Mr. Fraser's good gasoline sloop the *Pride*, James Prescott captain, and covered the eight miles to them in all too short a time, for every foot of the coast line we passed was of surpassing interest. Black lava cliffs rise ruggedly from the water's edge, broken here and there by narrow sandy or gravelly beaches, where a cañon comes down to the sea.

LANDING IN VALDEZ CAVE, SANTA CRUZ ISLAND.

In most of these cañons are fine groves of oak and willow and holly, changing into pine higher up. The black cliffs are overhung on their upper portion by an irregular fringe of gray lava, in the distance having all the effect of fine old lace against a dark background. The rock is pierced by a great number of holes and caves, and some of those at the foot give out cannon-like reports as the waves beat into them. Here and there at the points, immense boulders rise jaggedly from the water some little distance out. We sailed between one of these and the frowning cliff from which it had parted. It is unclimbable, and a nesting place for the gulls, which were resting upon it in hundreds. The upper portion has the shape of an old hag's or witch's head, beak-like nose, sharp protruding chin, a profile face gazing malignantly at the opposite cliff. Arrived opposite the entrance of the caves, we dropped anchor at the edge of the kelp and the boat was lowered. There were so many of us that only a part could go in at a time. We who remained on board felt "creepy" as we saw the skiff and its occupants disappear into

the skiff and walking around to the right, we went out through another opening to a lovely beach, where the surf breaks gently over the glistening sand. Back from the beach is a grove of large live oaks on either side of a stream of cold, clear water, tumbling down in little cascades from the steep mountainside, an ideal spot for a summer camp. Or one could make his home in the great cave. It has still another opening on the west side of the point, three entrances in all; is about 150 yards in length, and from 30 to 50 feet in height. The floor is of clean white sand; there are shelves here and there, along which we carefully and vainly searched for any relics of the ancient inhabitants. Yet one may well believe that they frequented the place. What a grand playroom it must have been for the children of a rainy day!

Passing out of the cave and across the length of the beach, we came again to the black lava cliffs and entered another rather narrow cave. It was but a short distance to another opening, and passing out of that, we found ourselves in what may be called the Grand

Cañon of the island. Its walls are very rough and picturesque, and several hundred feet in height not far back from the sea. Along its center is a deep, smooth gash, cut in the rocky bottom by the stones and sand brought down from the mountains in the rainy seasons. Here the tides rise and fall without a sign of undulating swell, and looking down through the clear water, the bottom at 20 and 30 feet in depth seems to be within reach of one's hand.

Another day we sailed toward the eastern end of the island to see the seal rookeries. All along from Prisoners' Harbor there are numerous sharp, narrow points, and deep little bays; and in the shelter of these the seals are found in herds resting upon the smooth-worn boulders and the beaches. Sailing within a few yards of Cochic's Point, and abruptly rounding it, we surprised several hundred of these master fishers of the sea. One by one and in dozens they slid or sprang into the water, barking excitedly, all but one huge old bull, who remained on his rock, head up and long neck outstretched, barking louder than any of the rest. And their bark reminds one instantly of other scenes in a faraway land, where the silence of a great forest is broken by the deep baying of a pack of hounds after deer.

The seals, all of the stellar variety, I believe, did not seem to be much afraid of us once they had gotten into the water, for they circled around and around, still barking and raising themselves high out of the water to get a good view of the boat. Further on we saw a number of other herds, but none so large as this. The picture of their rookery was taken by Rogers, the Santa Barbara photographer, by paddling up close to it in a skiff. At the time 441 of the animals were counted upon the beach and isolated boulders!

It is along these islands that all the seals are caught for training and exhibition purposes. They were formerly taken with the lasso, but finding that too dangerous work, the fishermen now use nets. These they set at the entrance to some cave after dark, so that the animals cannot see them, and then about daylight they frighten them by firing a gun. Out they come with a rush, sometimes in such uncheckable numbers that the net is torn away from the men. If a few are successfully enmeshed, they often drown before they can be gotten out of the water and into the cages at hand. Again, when one or two old bulls are caught, the netters are more than glad to loosen the net and let them go, for they make a wicked fight when cornered. Several years ago a fisherman named Velasquez lassoed a moderately sized bull, and the animal made straight for him, and with one lightning-like grab tore out his intestines. The poor fellow lived but a few moments.

There is no better authority upon the seals, the sea otter and other animals of this vicinity, than Captain Prescott. He says that years ago there were thousands and thousands of seals along the islands, and that great numbers of them were annually slaughtered for their skins and oil, until finally they were nearly exterminated. The cheap by-products of petroleum have taken the place of the oil, so that they are no longer hunted except by occasional craft which catch a few for museums, and are therefore constantly increasing in numbers. From Richardson's Rock to Catalina Island, and including San Nicholas and Santa Barbara Islands, he estimates that there are now at least 4,500 of the animals, leopard, and stellar seals. At Richardson's Rock a few sea lions are found in the spring, but they leave in June for parts unknown.

The Alaskan fur seals often passed several winter months in the Santa Barbara Channel in fair numbers, but are rarely found here in late years. As to the sea otter, he says they are also increasing, as they have not been hunted in recent years. There are a few about the kelp beds of every island; but their favorite ground is around San Miguel Island, where, he believes, there may be as many as one hundred, and three hundred, including all the localities.

The Captain favors killing off all the pelicans. At least 1,000 of them, he avers, are breeding this year at the east end of Santa Cruz Island. "Each bird eats at least four fish a day, so that this one colony destroys 365,000 fish in a year—fish which are needed for the sustenance of man."

On every point along the north side of the island, and back of the sheltered bays, are to be found immense deposits of shells, often five and six feet in depth. They are of every description, abalone, oyster, clam and conch, but consist principally of mussel shells, as these bivalves were most numerous and most easily obtained by the natives. Few of these deposits have been dug over, and undoubtedly contain many interesting specimens of the handiwork of the ancient inhabitants. In digging the foundations for the Inn, Mr. Fraser's workmen found a number of lava bowls, pestles, sinkers, flint knives and arrow points, and eighteen human skeletons. These latter were lying in a circle, on their backs, and with their feet to the charred remains of a fire. Some were the bones of men, and some of women, and besides the stone and flint implements buried with them, a number of rudely fashioned dark blue soap-stone beads and fishes were found. There is no soap-stone native to the island, nor none, it is said, to be found in California, so it must have been gotten in commerce with other tribes. It is also said that the little rudely-carved fishes were the most valued of all their possessions, and were used by the medicine men as a sort of fetish or idol while praying. Most of the beads are from three to six inches in length, an inch to an inch and a half in diameter in the center, and gradually tapering toward the ends. Some have holes drilled clear through their length, others none, while in still others the holes run in only a quarter or half inch from the ends. Whether they were strung around the neck, or used in other ways, is not determined, for those found seemed to have been laid upon the bosom of the dead. If they were used as ornaments, their owners seemed to have poor taste, for they could have made lovely necklaces and ear pendants from the gorgeously hued abalone and other shells. Many seal bones are found in the shell mounds, and but few remains of fish. It is likely that the main food of the people was seal meat, shell fish, acorns and berries.

Captain Prescott told us a very interesting and pathetic story about the very last native inhabitant of the islands. Out in the ocean fifty miles farther from the mainland than Santa Cruz, is San Nicholas Island, barren, except for a few shrubs, and waterless save for one small pond. In its whole circumference there is no harbor, and even in the mildest summer weather its fringe of gigantic surf affords a precarious landing. The early Spanish navigators found this island to be inhabited by a fairly numerous native people, and toward the end of the eighteenth century removed them all, as they thought, to the mainland, there to live and toil, under the care of the Franciscan fathers. About 1832 some Spanish fishermen, landing upon the island to replenish their water casks, found human foot prints in the sand, but although they searched long and carefully they were unable to discover the maker of them, and they sailed away. Time passed, and for many a season the island was not again revisited; but in 1852, eighteen years after the foot prints had been seen, another party landed on the isle, also to refill their water barrels. They, too, found human foot prints on

FAY'S HARBOR, SANTA CRUZ ISLAND.

the beach and followed them to a cave which was inhabited, but no one was found in or near it. So, filling their casks, they rowed back to their bark and, after night had fallen, again landed and went to the cave. There they found a lone old woman, dressed in seal skin clothing. She seemed to be pleased to meet them, laughing and chattering in her strange language, and she hastened to get them a meal from her goodly store of various sea foods. By the use of crude signs the fishermen made her understand that they wished her to go to the mainland with them, and she, probably remembering that such a craft had taken away her people and that it had now come to bear her to her kindred, readily consented to go. When she had been taken aboard, everything she there saw surprised and interested her, most of all the cook stove, with which she seemed to be infatuated; and all the way over she kept a fire going and cooked a number of dishes of her store of food, which she had insisted should be taken aboard. Arrived at the Mission, it was found that none of the natives there gathered could understand her language, and from all the surrounding tribes the Fathers had members come to see her, but not one of them could speak her language. Meanwhile, the old woman seemed to be happy in her new surroundings, and interested in everything she saw, anxious to work and be of use in the family with which she resided. The sight of a team of oxen slowly dragging a plow was the cause of intense astonishment, and soon recovering from her fear of them, she followed them about the whole day with great interest. In a few weeks after her arrival the various fruits began to ripen, and she ate of them heartily. Used all her life to the simple sea foods, seal meat and shell fish, this new diet had a disastrous effect; one day she was stricken with an acute attack of cholera morbus and died after a few hours of suffering. So passed the last of the San Nicholas people, a tribe distinct from those who had inhabited the neighboring island of Santa Cruz. A few of the latter were still gathered around the Mission, and had vainly endeavored to converse with her.

Years and years ago some one turned some pigs loose upon the island (boars they are called), and they thrived. Indeed, so numerous did they become that last winter the owners of the land offered their herders and laborers a bounty of five cents for every one they could kill. To give an idea of the great number of these animals it can be said that during the past five months the chief herder, or ranger, with his pack of boar hounds, has killed 2,600 of them. They are an exceedingly shy animal quite as much so as the bear, and, like the latter, depend upon their ears and nose, rather than their eyes, to apprise them of danger. It is really good sport to stalk them, for as much care must be exercised as in approaching many game animals. The long tusks of a boar are no mean trophy; nor is a wounded old boar, or one brought to bay, unworthy of the hunter, for they often make a desperate and fearless fight.

Save for the mice, the only quadruped native to the island is a queer little fox, much smaller than the "kit," or "swift," of the plain, which inhabits it in great numbers. Its legs and under parts are a deep brownish red, its back and tail a dark silvery gray. It climbs trees! and most curious of all, it is by no means strictly carnivorous, for its secretions consist in part of the

seeds of various berries. It is a fearlessly simple little creature, often coming around the cottages and inn in broad daylight.

There are many varieties of birds upon the island, most of them unknown to the writer. Valley quail are extremely plentiful on the south side, and the mourning dove is heard on every hand. It is a shame that the State of California allows the latter to be shot at certain seasons of the year. How can any one who has listened to their musically mournful notes have the heart to kill them? They are in no sense a game bird.

And now as to the fishing: Along the shore and the edge of the kelp beds, quantities of sheephead, rock cod, sea bass and other shallow water fish can be caught at any time. Out only a little more than a mile from Pelican Bay is a reef, where, at any time also, one may have all the sport he wishes with black sea bass or jewfish, whitefish and halibut. The true game fishes, the tuna, yellowtail, albicore, barracuda and white sea bass, do not appear until the last of April or the beginning of May, as a rule, but, so we were told, they come in far greater numbers and stay longer than any-

where else on the southern California coast. Mr. Harrison T. Kendall, of Pasadena, and a member of the Tuna Club, fished these waters last season and says that he never saw so many tuna elsewhere; there were times when acres and acres of the placid sea were alive with them. Mr. W. G. Campbell, of New York, and Cass, Mexico, is another enthusiastic fisherman who has had great sport here and prefers the Santa Cruz fishing ground to any other he has found from Central America northward. All in all, this lovely and peculiar island is a place which we leave with regret. The climate never cold and never too warm, the grand forests, cliffs, cañons, mountains, and the clear, green sea with its wealth of fish surrounding them are well nigh irresistible. There is much for the general tourist, the invalid, the world-weary, for the scientist and the angler, which most likely cannot be duplicated on either coast of our country. MANZANITA.

An Adventure in the Jersey Woods

It is now more than twenty years ago, yet vividly as if occurring yesterday, arises my memory of an experience in a lonely forest at midnight in the lower section of Monmouth county, New Jersey.

Manasquan River, which is quite a pretentious stream, is the dividing line between Monmouth and Ocean counties, and it was near its banks I got the worst scare of my more or less eventful career.

It was late in November, and important business of my employer kept me waiting at the home of a person who was absent until past 11 o'clock, it being imperative that I should conclude a business arrangement that night and be on hand with some commercial paper the following morning. The lateness of the hour precluded the possibility of hiring a conveyance, and the last train had left the railroad station, three miles distant, hours before. My shortest route lay partly along an old road but little used; this short cut made the distance home 11 miles, and the night was bitterly cold. I was not overjoyed at my enforced detention and consequent privilege of "hoofing it," but started out, being fully assured I would have no difficulty in keeping the trail.

The moon was shining brightly, so that every object could be distinctly seen, and as seven of the eleven miles were through swamp and roads without a house the entire distance, it added greatly to my comfort. There had been a heavy rain a day or two previous, and the sandy road was washed as level as a floor, which in turn being now frozen solidly, made walking comfortable, or as comfortable as a pair of new calfskin boots not yet "broken in" would allow.

How well I remember those boots, and the good-natured countenance of "Elisha Peggs" who made them! I had a first-class revolver in my pocket, was young and active, and besides, what was there to dread, other than the feeling of loneliness? I had gotten perhaps half over the worst part, and was stepping briskly along, when suddenly to my left I heard a crackling among the bushes. I stopped short and peered in, but could see nothing. In a moment, however, the noise was repeated, accompanied by a shuffling among the leaves. Stepping around a clump of laurel bushes, expecting to see a stray horse or cow, judge of my consternation to see an immense brown bear

rear up on its haunches, evidently as much surprised as myself at the meeting. Rooted to the spot? No, sir, not a bit of it. I was never freer to move in my life. As the bear was at the side of the way, it was as hazardous to retreat as to advance, and I had the best of reasons for going that way. It would seem absurd to stand in the cold and argue points of etiquette with a bear. Besides, as the hour was late, I had a strong desire to be home. I accordingly ordered an advance in about the fortieth part of a second, and, shades of memory's winged heel, how I went! Those tight boots hindered me not, for I struck nothing but high places in that road for about two miles, convinced that at least a quarter ton of bear was reaching for my coat-tails at every leap.

The flight at last had an ending, and I reached home somewhat ahead of schedule time. My story, of course, was received with incredulity, and nods and winks were plentiful whenever I repeated my experience.

Two or three days later, however, a baker, who was, and is still, well known in those parts, started out with a full load of wares, his business being to supply stores along the coast near which there was no bakery. He was driving a team of spirited young mules. That night a neighbor took him home, minus eakes, wagon and mules, and in a bruised and badly dejected condition. His explanation was: "A bear walked right out of the swamp in the face of those mules, and, mule-like, they turned round as though they were hung on a pivot, upset my wagon, smashed it to smithereens, and spread destruction and eakes everywhere. They are somewhere down in the cedar swamp, cuss 'em!"

Here, then, was the beginning of proof that I had not mistaken a stump or some wandering domestic animal for a bear.

The mules were found next day, tangled by the harness, in the heavy underbrush, and unable to go any further, and standing head-to-tail, as though keeping a lookout for that bear in both directions.

And now comes the tragedy in the story. Several days after these incidents, two lads gunning near Vineland, N. J., found in the woods the mangled remains of a man which had lain a long time, and were identified as those of a wandering Italian who had exhibited a performing bear in the autumn through the lower portion of the State. The animal had evidently ended his master's life, and, freed from restraint, had wandered a long time alone. After the finding of the body, a general hunt was organized. The trail was struck, and on the second day bruin was brought to bay and shot by E. H. Height, familiarly known throughout the State as Hart Height, a famous trap and field shot.

My revolver? I found that in my pocket all right, when I found time to search for it.

Now I have never found cause to blame myself for abruptly parting company with that bear. I did not know it was longing to be caressed and sung to. It is true, I was not a long distance from home as distance is ordinarily regarded, but five or six miles is quite a stretch when one is alone in the woods with a bear, even though it may have a ring in its nose. LEONARD HULIT.

The Sportsman's Plea.

It is getting to be a very generally accepted idea that the love of shooting, fishing and kindred sports is just a relic of barbarism, persistently cropping out in civilized man; a cruel thing, to be fought against and overcome; a savage phase of boyhood, indicative of an undeveloped nature, which may perhaps be pardoned for the time being in those who find pleasure in killing, provided they exhibit a decent sense of shame and sincere desire for reform. The present-day school of humanity seems to have developed a somewhat morbid and unnatural view of death in any sudden form, apparently forgetting that since life first began this has mercifully been the natural ending of a great majority of all living things. The only unnatural death is the slow, lingering death from old age, one of the unavoidable penalties of civilization.

Now, to destroy any living creature in wantonness or in hate is an evil thing to do, and something which no true sportsman likes to be guilty of.

It is perfectly true that he goes to the woods with the direct object of killing for pleasure, offering no excuse of necessity or profit. Yet he scorns to kill any creature that may be used for food, unless it has proved itself in some manner an enemy to man's welfare. He simply desires some well-founded reason for the killing of the wild creatures which he takes equal delight in watching or pursuing. For my own part, I feel a genuine fondness for all hawks, the wide-winged hen-hawks in particular, as they circle, screaming, high above the pasture. Their whistling in early spring is as welcome to my ears as the first bluebird's note, and the exultant cries with which in June they invariably announce the first appearance of the young hawks in the nest among the pines.

But for all that I could not, if I would, suppress a kind of gladness which I feel whenever one of them declares war upon the poultry yard, a promise of long walks over rough hillsides with rifle or shotgun, stalking the wily freebooter from tree to tree with an occasional long shot as he perches erect on the top of some weather-beaten pine, or sails past overhead clear cut against the blue and white of the sky.

When at last a lucky shot brings him tumbling to earth, my exultation may perhaps be mingled with something of regret, but not with pity.

You may pity the plover or hare that you have shot; but it is like offering an insult to the hawk to pity him who asks for no pity and has himself killed his thousands in perfectly fair and open hunting. There must be no motive of revenge or punishment, for the hawk has done no wrong in following the law of his nature, but when it appears right that a hawk should be shot, be honestly glad if you can feel the hunter's joy in doing it, fairly and without treachery or hatred.

I know of but two classes of animate things which I hate, without reason—spiders and, to my own shame, some dogs. There are hideous fat-bodied, gray spiders, with crooked, grappling legs, that swing their webs in stables and out-buildings. I have smashed and drowned hundreds of these, and with excellent reason to back me in doing it, for their stout webs obstruct doorways

and passages; yet I can never kill one of them without a genuine feeling of self-contempt and disgust, for I know that I hate them without reason and destroy them in hatred.

It is far pleasanter to go out into the fields of a bright morning and shoot down the little Bob White, whose merry whistling has cheered me all summer long, for this I can do without loss of self-esteem, so long as no wounded bird escapes to die a lingering death, but little better than that which comes by sickness or old age. He has had his summer of happiness with his fellows amid green fields and blossoming hedgerows, and now to meet death quickly in mid-air on the wing calls for no pity or regret.

The real sportsman does not add to the general sum of necessary pain and suffering in nature; he abstains from shooting in the mating and breeding season when the wild creatures have the long summer to look forward to and are grouped in families dependent on one another; for him the shooting season opens only at the approach of cold weather after the game has reached maturity and each is dependent only upon itself for a livelihood. He makes every effort to allow no wounded creature to escape, though in so doing he must let go by many an easier shot. He is contented with a moderate bag, and when, as even now occasionally happens, an unusual flight of game birds offers opportunity for unlimited slaughter, the sportsman's unwritten code restrains him even at those times when his greed is unappeased with a moderate number of birds. Being only human, he cannot always be consistent, thus he scorns the pot-hunter who shoots his birds on the ground, though shooting on the wing must necessarily mean a greater proportion of wounded birds; but he is not hypocritical, his frankly avowed object being sport, he endeavors to derive as much pleasure as possible with the least destruction of life, and this he finds in the successful pursuit of wild swift-winged game with the hazard of chances in its favor. Shooting at a motionless bird within easy range of his gun may be merciful, but savors too strongly of murder or execution, and leaves a bitter taste in the mouth.

Those species which have been greatly reduced in numbers in years past by persistent hunting should not be shot at any season, even though the law permits; yet the temptation to add these rare birds to his bag when the occasion offers is one which every sportsman finds almost impossible to resist. Many species now show a decided increase in numbers from season to season, and it is pretty certain that their numbers may be reduced more mercifully by the gun in the autumn, than by their natural enemies accustomed to hunt indiscriminately at all times and seasons.

If permitted to multiply unchecked for any number of years, sickness and famine would finally thin them out in a manner vastly more painful.

If deer continue to increase at their present rate, they are certain, in a comparatively short time, to become nuisances; then the law, which now protects them, will have to be repealed until their numbers are reduced. Now in many places they have already lost their fear of man to such an extent that no one with the instincts of a sportsman could bear to think of killing one of them, only the pot-hunter with his shotgun and buck-shot will profit by their abundance. Even from an æsthetic point of view it would be better that their increase should not be allowed to continue indefinitely.

At first thought it is delightful to cherish the idea of these beautiful soft-eyed creatures nibbling and browsing unafraid everywhere along country road-sides; but familiarity, though it cannot breed contempt in this instance, certainly lessens the enchantment, and in a little time we barely notice them as we drive past, only taking the same casual satisfaction in their beauty that we get from seeing a drove of handsome cattle grazing. As a matter of fact, deer seen under these conditions are but little more beautiful than are Jersey heifers that have lived all summer in the open air. It is only when really wild deer dash away in the distance startled by your approach, that your nerves thrill and your eyes grow dim with the intense pleasure of their wild beauty. As regards their own state of happiness, fear is not necessarily akin to unhappiness; human beings who are seldom or never called upon to face danger or flee before it are certainly not the ones to be most envied, and judging from careful observation I am pretty thoroughly convinced that few wild animals really suffer from the fear of death in any form.

It is greatly to be desired that the woods throughout the country shall become stocked with deer to a certain extent, even from the most practical standpoint; so long as the law permits of their being hunted for a certain number of weeks each season they will hardly become so tame as to destroy the farmer's crops to any great extent, while the flesh of those that are killed will furnish healthful and delicious meat for those who have a taste for venison, and this venison raised without care upon leaves and wild forest-growth will actually be more cheaply produced than any beef or mutton. The farmer who protests that it is unfair that city sportsmen should kill the deer raised at the farmer's expense, has the privilege of posting his land and legally keeping off all trespassers, though in so doing he must take his chances of making bad feeling and getting himself disliked.

The game laws in this country are on the whole excellent, their chief fault being that they lack simplicity; it is useless to attempt to adapt the law perfectly to each species of game. I find that outside of the ranks of enthusiastic sportsmen not one in ten manages to keep posted on the varying open and closed seasons of the different sorts. The farmer or business man who likes to take a day off for gunning now and again, as the occasion offers, is puzzled to know just when he may lawfully shoot certain kinds of game.

An example of the impracticability of endeavoring to vary the opening of the season to suit the habits of each species, was the attempt made here in New England a few years since to allow the shooting of woodcock to begin a few weeks before quail or grouse. Woodcock nest and mature very early, and by mid-summer the young birds are as well able to take care of themselves and as difficult to shoot as are grouse in September, or quail in October; before the latter are well grown, practically

all the native woodcock have left the region unless the weather should prove unusually cool and wet. It seemed, therefore, only fair that the gunners should be allowed to go after woodcock in August.

But it soon developed that the market-hunters were tempted to fill their pockets with half-grown partridges which were easily killed and sold readily under the name of "short-billed woodcock;" even sportsmen who should have known better occasionally yielded to the seduction of a tempting shot at some old grouse when woodcock were difficult to find.

Bird lovers, including the sportsmen, are not a little disturbed over the possible extinction of our most beautiful species of wildfowl, the summer duck, and it has been proposed that a law be passed forbidding the shooting of this bird at any season. It would seem that any one who knows anything of duck shooting must realize the utter futility of such a law. Duck shooting is commonly at its best in misty weather and in the twilight of morning and evening; at such times it is out of the question to expect the duck hunter to distinguish between summer duck, widgeon and teal as they whiz past overhead or rise spluttering from among the rushes in the uncertain light. To be in any way effective the law must apply alike to all species of ducks in any region. If the existing laws are properly regarded and spring duck shooting put a stop to in all parts of the country, I can see no reason why summer ducks should not multiply and have their nests in all parts of the country where the conditions are favorable, for they are unquestionably as well fitted to look after their own safety as any species, being expert divers and swift fliers, extremely difficult to hit on the wing, and in spite of the brilliant plumage of the drake, the smallest tuft of grass or pickerel weed serves to hide them completely. In the closed season they throw off much of their wildness and nest as contentedly in parks and beside mill-ponds as in the wilderness.

There is chance for immense improvement still, both in the enforcement of the existing game laws and in the unwritten code which sportsmen acknowledge, and these will undoubtedly come in good time.

But shooting and fishing call for no excuses and will always continue to keep our race sound in mind and body and free from morbid over-sensitiveness and misplaced pity; despite the protests of those who persist in associating these sports with wanton cruelty, and would, we must suppose, prefer to remake the fixed laws of creation and either do away with death entirely, and so allow each creature to continue in its present state indefinitely, or, if it must die, give it the privilege of suffering a slow death from old age or sickness.

For those who protest at the natural love of hunting in man, also shudder at the idea of the sudden death of the song bird in the claws of the hawk, and, to be consistent, must of necessity continue their fault-finding down through every stage of the struggle for existence in nature.

Frank Bullen, in "The Cruise of the Cachalot," gives a pitiful account of the dying of old age of the frigate birds on their native islands, where, with no natural enemies to put them out of their misery, they are doomed to a lingering end. Even should their younger companions have taken pity on them and brought them fish, it would merely have dragged out their suffering a little longer. W. E. CRANE.

Denuding Mountains and Lowlands

Editor Forest and Stream:

I have read with interest the communication of Mr. McCandless. As long as a man can secure Government scrip, so long will such things continue. Our land laws certainly need revision, and the stone and timber act, no doubt, in time will be repealed. Fifty years from now volumes will be written upon the shortsightedness of our legislative bodies in neglecting to safeguard our timber interests.

Perhaps in no part of the public domain has such highway robbery and such fraud been perpetrated as in the public timber lands. To prove this, it is only necessary to show by statistics the lumber manufactured for fifty years past, and then compare the records of actual timber sales made by the Government. The disparity is startling and astounding.

They tell a story of a prominent Michigan lumber operator who invested his all in a 40-acre tract of Government timber land, and then commenced logging operations. He cut timber for ten long years and became a millionaire several times over, and when he quit it is stated that the original "forty" which he bought and paid for was yet standing intact, and curious to relate, the records showed no other transfer of timber land to the operator.

Things are of course a little different now, but yet there is much perjury in connection with timber holdings. The stone and timber act is one that needs repealing, and no doubt something definite will soon be done in that direction.

On this subject there is perhaps no better posted man than Prof. Pinchot, of the Bureau of Forestry. I, for one, would like to read a paper from his pen upon this subject.

Many of the acts of our worthy President, Mr. Roosevelt, in time, will be forgotten, but the work of his hand in saving to the nation the forest reserves, put into effect during his administration, will outlive in man's memory and overshadow in importance all the other good things he has done. He certainly is building better than he knows, and better than he can ever know. Future generations will have cause to be thankful for what he has done to keep safe a few of our remaining timber growths.

Within the past ten years forestry and reforestation have gradually assumed a tangible, practical shape. It is a matter of regret that the strong sentiment existing today in favor of perpetuating our forests was not in existence fifty years ago. But the pine forests were counted as the buffalo—beyond extermination. The buffalo went the way of all flesh, and unless the men who rule the destinies of the country see to it in the repealing and bettering of our timber laws, our forests will follow in the wake of the buffalo.

Millions of acres of sandy, stony soil, once thickly covered with white and red pine, turn their unproductive faces to the sun and become as worthless desert spots

upon the map. Soil that grew pine once, can be made to grow it again. The reforestation of land is not one in which private capital will venture. The returns, while certain, are too remote. Reforestation is something that alone can be successfully carried on only through and by the national and State governments. Germany is a standing beneficent lesson in forestry that this country might well profit by. The German forests will be as thriving and remunerative a thousand years from now as they are to-day. Legislators are prone to interest themselves in bills that effect the every-day existence of their constituents to the absolute exclusion of the future, and while posterity is not alive to-day to plead its cause, yet it will live, I am afraid, to curse the shortsightedness of the men who made the laws and who went before.

CHARLES CRISTADORO.

Before a Jury of His Peers.

It is in my mind that I have a crow to pick with Brother Samuels, due altogether and wholly to his seductiveness as a scribe and knowledge of has-beens; and I hereby lay my case—as a layman—before the jury and cry for judgment. "Which I am no lawyer," as Truthful James might say, but rely solely on the justice of my cause.

Be it known, then, that said Brother Samuels did in an enticing article some months ago make mention specially of the wide difference in coloring found in the trout that have their habitat severally in Wild River, and its tributary, the Evans Brook, near Gilead, Maine.

Now, that is an old stamping ground of mine. On this matter of color, B. S. is correct. Your Evans troutling is dark, ruddy of fin and tummy, even as stated, and his Wild River mate is well-nigh as silvery as a shiner. He omitted to point out that our brunette dwelleth—or did—in a tree-hung stream that is indeed but a brook, with, at that time, plenty of shadowed places and dark-stoned bottoms. The river, per contra, is a wide expanse of stones for many a mile, sometimes over 100 feet wide, through the midst of which the water ambles along and yells over the wilderness of white rocks it has to irrigate; and the trout reflect its whiteness in their sides. But that is a detail. The main iniquity is his assumption that trout are there.

Fate had it, that as I rode in the train with FOREST AND STREAM and that article in my lap, along came a friend of my boyhood, who has big lumber interests in that region, and gave me a hearty invitation to "come up and go troutling" once again. The old trail in was now a spur line of the railroad, he said, and a locomotive came down twice a day with the mails. I could go up on that. Now, my vacation was planned for Bethel, Me., ten miles below. The more I thought over that invitation, the more that article of Brother Samuels got in its evil work, till—well, what would you have done? I just dropped things and scooted. Hence this plaint.

With a locomotive for transport, "going light," of course, was needless. So I filled my valise with a fishing suit, rubber boots, some "bait"—since my flies were a bit war-worn and Russian-like—and took the morning train upward. Gilead was there, all right; also the spur line, somewhat like an inch-worm, up and down. But no loco. However, here was a saturnine individual with a mail bag, and him I suavely interviewed.

"Locomotive? Taken off."

"When?"

"Last week."

"What for?"

"Not enough business."

"How does one get in?"

"Walk."

"Hum. Want to carry my valise in for a consideration?"

"Not for five dollars."

"Well, I don't know that I would if I were in your place." And in all amiableness I even swung the thing a-shoulder and started to hit the ties over the four-mile stretch.

Sir Saturnine trudged alongside a rod, and evolved a thought.

"You can go up on a hand-car if you'll help pump."

"Done!" And lo! the animile lay before us, loaded with section tools and locked. But the man of mail had a key that fitted, and he proceeded to dump the tools by the wayside. Now, hand-car work on an up-grade is mightily like the case of the Irishman who begged to work his passage on a canal boat, and was set to driving the mules along the towpath. After an hour or two, he gave it up, saying, "But for the name of the thing, I might as well war-r-lk." Still, at least, it was speedier than walking; and presently we overtook a wayfarer and slowed up.

"Going in?"

"Yers."

"Want to help pump?"

"Guess so. This 's a better car than the one you went down on."

So my amiable host had swapped with the section men! I imagine the air was lurid around the station when they returned. This explained, too, its fine equipment of hardware that we left. The man of mail retained his brass, however. He needed it in his business. Presently we picked up yet another man, likewise "going in," and we four made time, the four miles being covered in thirty minutes, buzz cart time. And the mail man didn't work over hard either. I be-thought me of Tom Sawyer, and his famous white-washed fence.

No matter, we were there—very much so—and I gave mine eyes an extra rub. When last I was on that spot, one house and one little two-man power mill stood buried among the trees. Now, I was in a rail-road switchyard in the bottom of a cleared valley, four or five miles in sight and a long-drawn-out village strung along for a mile or more in the hollow of the hills! Furthermore, the mills were silent, the male population, young and old, was free-footed; and the water was low as my spirits, as I sized up the case. What had Brother Samuels said as to this? Nix!

The post-office was at the far end of the valley. So

was friend H. Thither must I go. So I shouldered in earnest that solid valise and trudged. The stalwart mail man sauntered alongside. And wasn't it hot! The sun blazed down into that trough like a blast furnace. Never in my life have I felt it like that. My weight is about 106 pounds; I'm on the sunset side of forty-five. Did that man alongside offer to lend a hand, to carry my rod even? Not he! In a long experience with men of all sorts I have not met his like. Let us rejoice, brothers, that such are few, since, when found, they are so "few in a hill."

No matter, again. One foot before the other, t'other foot before the first, one gets there or somewhere in due time. And H. was found, plump and jolly, well worth a tramp to meet again, even to arriving like a tramp. Something to eat was forthcoming instantaneously, but not much did I tarry over that. Excelsior! And I whooped it up stream on mine ancient trail, now a broad, well-traveled road!

Well, it was pleasant once again to watch the water gleam in the sunlight golden; to pick wild raspberries by handfuls; to splash across through the shallows; to try every riffle, hollow, bend; and I tried 'em all with exceeding faithfulness. As the sun slid down, I could say that I had covered enough of that stream to warrant a just opinion of its merits as a popular resort. It had been popular—there was no doubt about that. In my long afternoon I saw just six trout of any size, five of which I caught. I won't say how large they were. I had no scales. Besides, it isn't necessary to the argument. They were trout; and the coloring was even as Brother Sam hath said. So might a hummingbird be of the color of an eagle, and both be birds.

Also I flushed a brace of birds of another color, and well worth seeing. Evidently a couple of college girls en route through the woods a-pony-back for some forty miles through the mountains with a guide. Like other lovers of wild life, I have a watchful habit, so it is not strange that I saw them before they saw me; saw them chatting merrily; saw that one rode saddleless on blanket and surcingle, and—astride; and saw the sudden acrobatic feet flash in a lightning-artist change back to the ordinary feminine position as her eyes chanced to meet me, while into the face dashed a sunrise color and a blaze of haughty wrath.

I wonder why. Had I no right to exist? I regretted that she saw me, however. To me, trout excepted, it is far more pleasure to watch some young wild thing at play unconscious than to kill it out of hand; and the role of kill joy is not one I hunt for, as a rule.

Thus meditating, I silently drew aside and let them pass upon their way.

But about my own plans—what next? This country clearly was over-settled with a free and independent population. I had discovered that even at that it had endured the invasion of thirty fishermen on a single Sunday not long before. Would it pay to tarry, and go up Wild River on the morrow as per plan? In olden time, even, it was needful to tramp miles on miles upstream before one saw a fin, as the lower reaches were ever barren. And now? Once or twice in my life before I've run up against a proposition like this and learned to know that there is a time, sometimes, when it is well to quit; to drop old plans for new, on a second's notice. So I even dropped that. Friend H. had gone out to civilization on business. The sun was low, the air was cool, I felt fresher than when I started. Vacation days are like a limited handful of gold coin—each one must be made to count to the uttermost to avoid after regrets. So thinking, I shifted back into my thin walking suit, swung my valise a-shoulder, and started out afoot "over my happy morning track," as Bird-o'-freedom Sawin said, tie-hitting down toward Gilead.

There is a pleasure even in bucking against fate; and there would be a freight train down some time in the evening by which to get to Bethel. So on I ambled, stopping now and then to raid the raspberries—thickets of them, untouched even by a bird in many spots! and cheered along as I trudged by the old familiar yell of the river water in the bed below. There is a wild, solitary sound about it ever, to my mind; a hermit song, driving away finance and other cares, and when I hear it I need no other company.

Thus passed an hour or more, and out of the woodland swung the road, into the hamlet Gilead; and I felt as fresh as a mountain daisy. Then to me spake the station-master, even as the boy who told his anxious mate, "There hain't goin' ter be no coré!"—viz., "No freight down to-night."

I thought a moment.

"All right; just check this bag down next morning," and took to the road again. Ten miles on a summer night would be a pleasure—perhaps. I'd always wanted to take that walk, anyway. Now I could. Then here came in a stroke of luck, viz., friend H., surprised, perhaps a bit dismayed, at my sudden exodus, and driving a stout white horse, suitable to his own inches. A word or two and a laugh made that all right, and dropping business he took the time to give me a four-mile lift on the way, while we reminisced over some thirty years ago. Then, with a hearty handshake, I took the road again—the railroad while I could see the ties, then the common dusty.

Dark? Well, summat! Twice I picked myself out of the ditch among brambles. Once I woke up a farmer for a quart of milk. For an hour I watched a thunderstorm gathering in the north. Yet with scarce a break in my steady, two-and-a-half-mile-an-hour gait, I found myself trudging past the village church as the clocks struck 10. And I figured out that, that brook and all, I had an eighteen-mile walk that day, with city training, or lack of it, and, as said above, on the sunset side of forty-five—and perfectly fresh next day.

But all the same, what saith the brotherhood? What is due to Brother Samuels, in the case before the court? Eighteen miles tramped, and five small troutlings—and what are they among so many?

All the game laws and fish laws of the United States and Canada are given in the "Game Laws in Brief."

Some Things that are Missed.

WYMORE, Neb., Aug. 29.—*Editor Forest and Stream:* There are two things in which I took delight when I was a boy, back in Illinois, that I miss very much now, as they do not grow in Nebraska. They were hazelnuts and crab apples. It may seem strange that a grown-up man would miss such things, but let me tell you something about them.

All along the small streams in that part of Illinois, where I roamed in boyhood, the crab apple grew in profusion. In the spring the very bright, red blossoms of the crab apple intermingled with the pure white blossoms of the wild plum; and no flower garden ever produced a more beautiful sight. And there is no flower or blossom that exhales so rare and rich a perfume as the blossom of the little crab apple. And when the apple itself was ripe it had a perfume that is not equalled by any other fruit, wild or tame. They were good to eat, and made delicious preserves, and I am told that cider made from them, while a little tart, was as snappy and sparkling as champagne. But I never tried the cider.

It was only a quarter of a mile from that little pioneer home to the first hazel bushes. They grew all along the edges of timber and made a kind of margin or border between the prairie grass and woods, and in that rich soil they were from three to six, or even seven feet in height, and they were full of nuts every year. The nuts grew in clusters or bunches, in hulls with from one to three, or even four nuts in each bunch, and were gathered in the hull and laid out in the sun for two or three weeks to dry, and then the nuts were hulled out, put in little sacks and hung up for winter use. They grew as large as any filbert (the cultivated hazel nut) that I have ever seen.

Some of my first hard work consisted of going hazelnutting. I was supplied with a two-bushel sack, with one corner of one end tied to one corner of the other end, and hung around my neck, with the mouth of the sack in front of me, so that I could hold it open with my left hand and pick and put the nuts in with my right. In this way I could get about a bushel of nuts, hulls and all, in the sack at one time, and it made a pretty good load; and a bushel of them in the hulls would not hull out more than four quarts of nuts. The hulling out could be done at my leisure, after they got dry enough and after the crop was all gathered; and then we had all the winter evenings, in which to crack and eat them, and while some may like the rich butternut, or the shellbark hickory nut, or walnut better, give me the hazelnut. The hazelnut harvest generally lasted about a month.

That neither the crab apple or hazelnut grow in Nebraska seems to me a great oversight, and I am going to see if I cannot supply the deficiency, to a small extent at least. I have bearing walnuts in my yard that grew from nuts that I planted, and I have butternuts growing also from seed sent to me from Illinois, and this fall I am going to plant some hazelnuts and see if I cannot have a "hazelnut patch," as we called it when I was a boy; and next spring I am going to plant some of the seeds of the crab apple. The hazelnuts and crab apple seed will be sent to me from near my old boyhood home.

My first experience in planting walnuts did not work just as I expected. I planted the nuts in the fall in a little bed near the house, and depended upon moving them in the spring, but out of all that I moved the first time only one lived, and I found later that if the walnut grew six inches the first year, the tap root would be about a foot long; and if the tap root was cut, the little tree would not grow. Then I resorted to the plan of planting the nut where I wanted the tree to stay, and had better success; but they can be readily moved if you go below the tap root.

And while I am pointing out some of the deficiencies of my adopted State, let me name a few other things that I reveled in when a boy, that do not grow in Nebraska, at least not in this part of the State. Black haws, red haws, May apples and ground cherries in the fruit line, and among the flowers, the following: Sweet Williams, lady slippers, blue bells, Dutchman's breeches and Jack in the pulpit (Indian turnip and Indian tobacco. How any boy can ever amount to anything without learning to eat Indian turnip and chew Indian tobacco, is more than I can understand.

A. D. McCANDLESS.

A Maine Woods Swindler.

BANGOR, Me., Sept. 30.—*Editor Forest and Stream:* Since the article which appeared in this week's issue of FOREST AND STREAM was written, on the subject of panthers in the Maine woods, it has developed that there are panthers, although not of the species considered in that letter. The kind referred to are of the two-legged variety, and their covers, instead of being in the forests, are in the secret places of the city.

During a recent trip to Moosehead Lake and the West Branch of the Penobscot, the writer learned of a development in the Maine "recreation industry" that might well be termed a "devil-up-ment," to apply a familiar pronunciation of the word. To be brief, it was simply a confidence game with the Maine woods as a shield, and both Maine and non-resident people as the victims.

Only in connection with an outing in the woods—that alluring prospect that for many years holds the most prominent place in the minds of those not so richly endowed with this world's goods as to be able at will to indulge the desire—could so cool and slick a scheme be worked as it appears to have been during the past summer, and this letter is written in the hope that it may prevent others from falling victims to this enterprising "promoter's" plausible scheme.

So much has been said and written by this sportsman or that tourist about the wildness of the Maine woods, their utterly trackless condition in most sections, and the greed of those into whose hands one sometimes falls, that it is not strange there are a good many people who would far sooner start on a trip to Europe or Japan than trust themselves amid the greatly magnified dangers of the

Maine forests. There is just enough truth in such statements to make them dangerous, and the timidity of this class of believers has suggested to someone a get-rich-quick scheme, through a series of personally conducted trips to the Maine woods, wherein the unfortunate victim should find his need of being personally conducted home again without the joys he had anticipated, and at his own further expense.

This man was first heard of at Northeast Carry, where indignation was high against his methods, owing to the experience of a man who had been made the victim of the plan. Briefly, he had paid this promotor a considerable sum, reported to be about \$150, and in return received a ticket to Northeast Carry and return via Norcross. At the carry he was to be met by a certain guide with all supplies and outfit for camping where the "personal conductor's" camps happened not to be, and taken down the river on that enchanting journey, which is one of the most delightful and most popular canoe trips in the world—the West Branch trip. There was no guide at the carry, no one who knew anything at all about such a guide or such arrangements, and had it not been for the generous courtesy of the manager of the Penobscot Hotel and Trading Company's store, he must have been obliged to either telegraph to New York for funds, or return the way he came. However, a canoe, guide, and supplies were secured, and he made the trip as planned, leaving the settlement with the New York man to await his return to the city.

Passing on down the river, Chesuncook was reached in a howling storm, and there at the Chesuncook House, sheltered by the kindly hospitality of good-hearted "Anse" Smith, were found two boys in their teens—mere young-

sters—whose parents had paid the same promotor a sum of money for an extended outing in Maine. Originally numbering some twenty boys in the party, it had become but two here, several having sent home for money to return when they found themselves abandoned by the man in whom they had put their trust, and who held all of their money. It was not known what had become of one party, the boys having split up on reaching Maine; but this crowd of some ten or a dozen camped on a lake near to Mooshead for a while, after which a start was made to the foot of Chesuncook, where the trip to Norcross was to be entered upon. The man in the meantime left for New York, having made, as he claimed, all arrangements for sufficient guides and provisions to be at the Ripogenus Carry and relieve the guides then with them, as these were engaged but for the short trip to Lobster. At Chesuncook Lake it was found that there were no guides to take the boys further, and the guides who had brought them thus far had other engagements, so that it was impossible for them to continue, even had they felt sure of being paid for it. The consequence was that a party of young boys was literally thrown upon the hospitality of people who had no interest but that of humanity in them, and not only was the promised outing spoiled, but they were obliged to wait until, one by one, funds came to carry them back to their homes. It also developed that numerous camps which the swindler had claimed to own, and which he located with truthful exactness, were mere public camping places, used and known of all guides and sportsmen who pass along that way, and he could not have secured permission to build camps there if he had so desired.

Seldom is anything so heartless done in the way of

bringing business to Maine, if such a contemptible arrangement of matters could be considered in that light from the most charitable point of view, and sportsmen, guides, camp proprietors, and others who heard and knew of the circumstances, and saw the boys thus helplessly set adrift so many hundreds of miles from home, united in denouncing, in the most severe terms, such a dastardly performance.

Sportsmen who want to make a trip to Maine and enjoy its unsurpassed loveliness of scenery, its marvelous wealth of fish and game, should consider that it is for the best interests of community and citizens to treat the visitors as if they were invited guests, and to a considerable extent this will be found to be the case, although there will naturally be found exceptions. One thing is, however, certain, and that is that any man wishing to make a tour of any portion of the Maine recreation belt, will find it full cheaper to arrange for his trip directly with some responsible Maine resident, guide, railroad representative, hotel or camp proprietor, or some other in touch with these matters, and save a profit to those who would, acting as middlemen, steal from both ends to make themselves whole or provide a profit. Maine is a big State, and there is so much chance for such humbuggery as the above apparent plan of graft, that the uninitiated should not put themselves into the control of any irresponsible persons. Enterprising men who might devise some such plan for woods tours as the above scheme was claimed by its promotor to be, should see to it that they have sufficient financial backing to carry such a plan out without a fizzle, and that some surety be provided their patrons that the plan, as paid for and agreed upon, should be carried out.

HERBERT W. ROWE.

NATURAL HISTORY

The Ignis Fatuus.

Editor Forest and Stream:

The article in the FOREST AND STREAM September 17 on the "Ignis Fatuus," brings back to my recollection an incident which I experienced about the year 1870. At that time I was managing an "estancia," or ranch, in Buenos Ayres; in fact, there were three separate estancias run as one by my employers; consequently there were three estancia or principal houses, the rest of the dwellings being "puestos," or shepherds' huts. Part of my time I spent at one estancia, and part at another, as the spirit moved me.

Now, the facts are as follows, and these I have kept pretty well to myself, for the simple reason that I have always thought that I would be considered a romancer—gifted with a superabundance of imagination, or by some, in plain English, a liar.

At one side of the quinta, or inclosure round the estancia house, used as a peach orchard for growing maize, etc., was a well, and previous to my occupation of the estancia, a hut stood by this well, which was occupied by an old man whose sole companion was a dog. The old man died, and the dog took up its abode at the estancia, along with numerous other canines of all colors and sizes, but of no particular breeds, and was there when I took up my quarters there. This dog, light tan in color, was looked upon by everyone as having most peculiar traits. It would never allow anyone to touch it, and even if spoken to, would turn its head toward the speaker and snarl, showing a very formidable set of ivories, and almost every night it would howl in that dismal fashion common to dogs.

From the neighborhood of the well arose almost every night a light, which would go bobbing up and down, and taking leaps of several yards, so to speak, for quite a distance in the campo or prairie; then it would take a sudden dive to earth and disappear from that spot. It would then, perhaps, be seen in another direction, and some distance from where it last disappeared, or perhaps not again that night.

On one occasion I was out riding with a Spaniard when this light appeared, about 300 yards from us. My companion proposed that we should chase the light, or "el luz," as it was called in Spanish. This we did, until it reached the wire fence inclosing the quinta, through which it passed, and cutting off a corner, emerged into the open campo again, not changing its motion in the least while passing through the wire fence, but disappearing for good for that night.

On another occasion the employers of the estancia had gone to a neighbor's to pay homage to a patron saint, as is the custom there. Some friends who were visiting me and I took a lantern and a sheet and located ourselves on the side of the trail, by which we expected the worshippers to return, hobbling our horses some distance away, and intending to give the party a scare when passing by exhibiting "el luz" under the sheet; for, as is generally known, the natives are most superstitious, and many were sure that the light was in some way connected with the late occupant of the hut, some going so far as to say that he had treasure hidden thereabout, and if asked, the light would direct to the place of its concealment. The party we intended to frighten took another trail, so we got sold for our trouble.

Now comes the most inexplicable part in connection with "el luz." One pitch dark night I took it into my head to go from one estancia house to another, about a league distant. I was on one of my most reliable horses, and was going at a steady canter, and when about a third of the way saw the light some distance off going through its usual exercises, i. e., bobbing up and down, and finally disappearing. This being of so frequent occurrence, I took no notice of it, but after riding half a mile or so further, without any warning, all of a sudden "el luz" appeared, just under my horse's nose; not exactly under it, but about eight feet distant, and about seven degrees

to the right of my horse's head. It was distinctly visible for about four seconds, and assumed the form of an animal. The head was exactly like that of the dog before mentioned, with its ears lying back and its usual snarl. The body was like that of a calf, particularly the tail, and in color was fawn and white. The whole was surrounded by a halo about six feet in diameter, and was as plainly visible as though it had been midday. My horse shied in such a manner as almost to throw me, as the whole thing was so sudden and unlooked for. Needless to say I was too frightened to ask the apparition or whatever it was where his wealth was stored, my only anxiety being to get out of the locality as soon as possible, not even looking behind to see if "el luz" was visible and bobbing I myself being too busy bobbing at that particular time.

Now, most people will say that this was all imagination on my part; others that I had been imbibing; others will think that I have the Ananias streak largely developed. But the fact of the horse also seeing it, and of his fright at the apparition, does away with these theories.

The above statements are facts, neither enlarged nor detracted from, and I would very much like to hear if any of your contributors have ever had a similar experience with "el luz" or any such ghostly body. It almost seemed to be a judgment on me for having tried to scare others with what almost scared me to death.

I. H. W.

Editor Forest and Stream:

When reading T. J. Chapman's letter in the number for September 17, I could not help but think that I knew where his Hopewell Church was. I may be mistaken; this is a common name in Pennsylvania, at least, but I think his Hopewell Church is in Ross township, Allegheny county, about five miles from Allegheny city, or it was that far from it then; it is almost a part of the city's suburbs now; a street car line has lately been built out to it.

If this is where he thought he saw his first ignis fatuus, it was one of them he did see, and not someone carrying a lantern, as he thought it might be. A narrow country road ran past Hopewell Church, and to where it entered the Perrysville plank road at Keating's tavern, two miles away. A mile below the church is Westview Farm; that is its name now; it had no name then; and down in a bottom to the left of this road was a pasture that was partly a swamp at some seasons; other times it would be dry, but the bottom of it was always covered with decayed vegetation. Here is where we boys found our jack o' lantern, as we called it then.

We always knew just when to look for it. It would always appear late in the summer or early in the fall before the cold weather began. We would put in whole hours after night trying to overtake the light, plunging through the swamp, deployed in a line that afterwards our skirmish line in the army reminded me of; but the light always kept just so far ahead of us, until it would come to solid ground, then vanish; or sometimes it would disappear short of that, only to appear again on our right or left or behind us. We would think, of course, that these lights seen elsewhere were the ones we had been following. I have no doubt now that they were different ones that we had stirred up tramping through the mud.

I had heard of this thing long before I saw it, and after seeing it I consulted my usual source of information, our Anderson Library, to find out all about it; but could find little, except its proper name, and that it was supposed to be formed of marsh gas. Since then I have often thought that natural gas or oil had something to do with forming it. This whole country was underlaid with both oil and gas, though we did not know that then, nor for many years afterward. When I last saw Westview the whole place was covered with oil well derricks, and a small fortune in oil had been taken out here.

Anyone who is familiar with the woods at night, must often have noticed the light that is given off by damp, rotten logs when freshly broken. When we were 'coon

hunting at night, and I carried the ax, I would split these logs open hunting for the light. I have thought that this light and the ignis fatuus might have had the same origin.

The explanation that is given as to how this ignis fatuus is formed is no doubt the correct one; it is nothing but a thin gas or vapor when it rises out of the ground, but when it comes in contact with the upper air it becomes luminous. It has very little light when you once get close to it; less light than it has when seen some distance away, and has no heat that can be noticed.

CABIA BLANCO.

A Story of Two Sandpipers.

Editor Forest and Stream:

A FEW weeks ago while shore bird shooting on the Chatham, Mass., flats, my father and I were eye witnesses to a very remarkable and interesting occurrence, which might be of special interest to some of our writers and students of bird life, especially while discussion is made by various writers about the possible reasoning powers of birds and animals.

While we were sitting in our blind, a small flock of least sandpipers, or as they are more familiarly known, peeps, came by, and when about ten yards beyond us, one of them suddenly left the bunch and lit on the open flat, and for quite a while remained perfectly still.

It soon became plain to us that the little fellow was wounded, as he soon showed signs of distress, accompanied by many shakings of the head, which led us to believe he was bleeding internally, especially as we could see with our field glass that he kept opening his bill, as though to clear his throat of something.

Soon another single peep came by, and seeing the first little fellow, immediately whirled, emitted his greeting "tweet," and joined him.

Almost immediately the well bird seemed to see there was something wrong, for, after walking around the sick bird two or three times, he seemed to actually begin to push him toward a small clump of beach grass, ten or fifteen feet distant from where they stood.

Arriving there, he again walked two or three times around the sick bird, then came close to him and laid his head across the other little fellow's back, after which he settled down on a bit of sea weed and watched him very intently.

In about twenty minutes or half an hour he again started the sick bird toward the heavy beach grass which joins the edge of the flats, and both disappeared within.

Waiting ten minutes or so I walked over to where they had disappeared, and saw what to me was quite a remarkable sight. There, about three feet inside the grass, was the sick bird, evidently grown very weak now, squatting on some sea weed, and standing in front of him, as straight as he possibly could stand, and with wings partly spread, as though to screen him from view, was the well bird, intently watching every move I made. I left them there.

Having observed and hunted shore birds for a good many years myself, and knowing their wild and wary nature, also my father having shot them for the last thirty years, during which time he has never seen anything like this incident, the occurrence was to me quite remarkable, as it not only showed that the well bird realized there was something wrong with his fellow, but he showed a loyalty and constancy to him in time of need.

PAUL H. LATHROP.

SPRINGFIELD, MASS.

The Linnaean Society of New York.

A REGULAR meeting of the Society will be held at the American Museum of Natural History, 77th street and Eighth avenue, on Tuesday evening, October 25, at 8:15 o'clock. Frank M. Chapman will lecture on "Florida Bird Life." Illustrated by lantern slides.

Some Animals I Have Studied.

X.—The Language of Fowls.

A FEW years ago "monkey language" was an absorbing theme among certain sensational (I say it respectfully) naturalists. I have often wondered why the familiar—perhaps too familiar—domestic hen has not received the attention she justly deserves in this line of research. I will venture to assert that no other creature, lower than human, possesses a language so complete or convenient, and so easily learned by man. What I mean by this is that although dogs or horses may have a greater number of words or expressions understood only by their own kind, man may easily distinguish a greater variety of sounds with undoubted different meanings among hen utterances than in the sounds given out by any other creature.

Now, notwithstanding their distinctness, I can conceive of no combinations of letters in our alphabet, nor any other, that could indicate their exact utterance; therefore I will not attempt the words themselves, but will simply give their English equivalents; first assuring the reader that this is no hoax, but fact, which I believe I can prove to any who may match me among hens, interpreting their sayings; or, better, fact which any close observer may verify for himself if he is fortunately situated where he can study the interesting and useful hen. The hen is an active, restless, avaricious being, therefore the larger portion of her vocabulary consists of exclamations.

Let us follow a mother hen with very young chicks, keeping back far enough to leave her to her own devices, but looking constantly at the flock and listening to every tone.

"Hold! Don't go so far away! Keep near me—keep near me!" she frequently says, as some heedless boy chick shows too great an enthusiasm. It doesn't sound a bit like that, but we know instantly that that is what she means, by her manner and the behavior of her family—although the prodigal may hesitate to obey; for he looks back, seems to say, "I'm not going out of sight, don't get anxious," and the others gather nearer, peeping self-complacently, "We obey our mother, don't we?" Conceal yourself behind that rosebush. Throw a chip over the flock so that it will sail gracefully far beyond.

"Squat!" instantly shouts the mother, and every chick, including the straying one, who is by this time entirely out of her sight behind a shrub, obeys with astonishing quickness. For a few seconds she continues anxiously to admonish them in low, gurgling tones, while they press closer and closer to the ground, if possible concealing themselves.

"False alarm—jump up!" is also at once obeyed, and the search for insect prey is eagerly resumed.

"Come on! come on!" she orders, and they trip along merrily, yet leisurely. But presently she pauses, looks back, and screams: "Hurry up!" and any and all stragglers show that they know what she means by exhibiting a sudden burst of speed.

To convince yourself beyond a doubt that a certain sound has a certain meaning to the chicks, you practice one of them until you can fairly imitate it. The command to squat, or drop low and keep quiet, is one of the easiest, and the after admonition is also very easy, both of which, if well executed, are obeyed as promptly and minutely for you as for the hen. At my command, they will even rise and run about again, although the mother may remain in an attitude of fear—for a good mother is always more anxious and fearful than her young.

Presently the hen finds encouraging indications, and begins to scratch. But by this time each chick has some task of his own to absorb him, and at first pays no attention to her. "Look!" she says, "Look! look! look! look!" (rapidly repeating the word, or syllable, about four times, usually after the first call), and now it really sounds like the English word look. The little ones "look," and gather round expectantly. She picks up a small, soft worm, and offers it to the first taker. She continues to scratch and pick up worms, and the feast continues amid musical peepings and giggles of delight. But finally a huge pinching bug is captured, and a wild uproar and fierce struggle ensues. Some greedy young rooster makes a dive at it, snatches it and runs away, several of his bolder comrades following, and falling over each other in a frantic effort to take it away from him, while the mother wisely cautions, "Look out! Look out!" in tones distinct and unmistakable.

Suddenly she gazes at some moving speck in the cloudless blue above, and says, slowly and calmly, but impressively: "O-o-o-o children, be still! I-i-i-i see a— I don't know what!" They all cease struggling and look about, with breathless interest. Some of the wiser ones say, "Chee-e-e-e, Chee-e-e-e!" and begin to cast an eye toward shelter.

The moving object descends, comes nearer, nearer, nearer, and begins to assume a larger form. Then the hen yells, "Hawk!" much more emphatically than she ever yelled "Squat!" and instead of quiet efforts at concealment as before, there is indescribable panic, even the oldest rooster, chief of the barnyard, forgetting his dignity, and racing for the house, loudly shouting, "Take keer! Take keer!"

Down swoops the hawk—a large one—with countenance terrible as lightning, at this moment paralyzing his intended victim with terror. But now the mother, deserted by her erstwhile boasted defender, shows the power of love to spur on to attempt the seeming impossible, and with a truly heartrending scream, hurls herself madly at the assailant. But hold your breath one moment and behold a marvelous change in the scene. For here comes to the rescue, just in the nick of time, one who is as watchful as the mother, keen of eye as the hawk itself, swift as the hurricane, mightier than any bird, and brave as anything that lives on earth or in the sea—the farm dog! And the bird monster turns back, almost too late to save himself, and flutters weakly away—thwarted, humiliated, wretched! This is a picture from real life, though hardly life-size. How many readers have witnessed this in all its details?

After a time the fowls, big and little, all venture out again. The hen whose fortunes we have been following gets too near another mother hen, whose young are near the age of her own. Both mothers ruffle their feathers and say things that are mutually offensive. One of hen

No. 2's chicks impudently enters No. 1's camp, foraging. The little ones receive him evilly, if not cordially. But as soon as their mother spies him, she makes a hideous noise, calling him a bad name or two, and making insulting allusions to his mother. Then she picks him up with unnecessary violence and seems about to kill him. Hen No. 2 screams with rage, and furiously attacks her.

"Hi, what folly! Stop this!" mutters the old rooster, in low but stern, gurgling tones, and attempts to separate them. Sometimes he succeeds, but often he doesn't. In the latter case, out again comes old Wateh, who quickly knocks them apart with his forepaws and nose, without harming either of the combatants. I have known fighting hens to be thus separated by some playful puppy or kitten, or pig. But the best peacemaker among farm birds that I ever knew was a pet wild turkey, who began his self-imposed police duties when no bigger than a quail. For some unknown reason all birds always ceased fighting when he interfered, no matter how much larger one or both of them might be. And, unlike a chicken, he always seemed to prefer to punish the one most likely to win! The cock invariably, I believe, punishes the one that is already incapacitated or giving way. The defeated hens now stump off with their complaining broods, their feathers erected, as if to make themselves as hateful to each other as possible, alternately hurling stinging epithets across the space between them and disorderly urging their young ones to avoid those other "low, vulgar chicks!" Sometimes a mother takes a spite at one of her own little ones, and again there are distinct utterances—words somewhat different from sounds uttered on any other occasion. She seems to say, "You worthless one, you ought to be killed to save future disgrace!" and the poor little innocent seems to agree with her, for it makes no effort to escape, though it may scream with pain. In this instance old Wateh ought to be allowed to more than interfere; he should immediately execute the monstrous mother, no matter what her theories may be about improving the hen race by "the survival of the fittest." Indeed, if allowed to live, such a hen is liable to become insane and slay all her young, and all others that she can get hold of.

An old rooster stands with a group of hens in an open space. A crow flies over. At first glimpse of the stranger they all dodge, then one or more say, "Crow!" and every trace of fear vanishes. It sounds like "crow," too, only I have noticed that they always say "erow" whenever startled merely, and not quite frightened. The old polygamist then drops his off wing with a rattling noise, trots sidewise up to a sober, thoughtful-looking hen, and hoarsely chuckles: "You're a beauty! You're all right! But don't you forget that I'm your best friend!" Then, repeating the same eccentric motion on the opposite side of her, perhaps all about her, he continues: "Say, don't let that young upstart, my would-be rival, fool you. I saw him strutting at you yesterday. I tell you he's no good. And I'm going to whip him, too, if I can persuade the coward to come over here." Thereupon he steps out where he can make a brave show, tiptoes, stretches his head upward to the utmost, and gives vent to his clarion, that mightiest of all bird tones, and most renowned. A young fellow a hundred feet away, surrounded by a small group of admirers who are far-seeing enough to comprehend something of his future greatness, though he is just beginning to "win his spurs," answers defiantly, and circles about his challenger at a distance; but he will come nearer some day, and yet nearer another day, and there will be bloody heads, and day by day the struggle will continue until the old one dies.

L. R. MORPHEW.

[TO BE CONTINUED.]

Another View of Bird Protection.

IN the current issue of the London Field, Mr. W. B. Tegetmeier writes of the multitudinous, contradictory, and in some cases unintelligible laws for the protection of birds in the British Islands, and puts forth some views on bird protection in general. He says:

"There is at the present time a ridiculous passion for the protection of all birds, without any discrimination whatever. Sentimentalists choose to imagine that all birds were specially created for the benefit of man, and may be encouraged beneficially in any numbers and in any district. Why this theory is not extended by them to mammals is not clear or reasonable; but faddists are seldom reasonable, and the result is that the most injurious birds, as well as those that are beneficial, are alike protected. They are introduced into countries where they have done immense harm, and it is alleged that agriculture and gardening are greatly benefited by their multiplication. The ignorance of the members of the county councils, who are seldom ornithologists, and in many cases not even agriculturists or horticulturists, regarding birds is unbounded. It is a fact that the taking of eggs of certain migratory birds that have never been known to lay in this country is prohibited. The councils do not distinguish between those birds that are natives of England and those that arrive in countless thousands in the migratory season. They regard the larks, which in the autumn are sold in tens of thousands in our markets, as birds which are bred here, whereas they are migratory birds that come from the Continent, and will return in a few weeks if not captured. They make the same error with regard to the immense flocks of wood pigeons which arrive and damage our crops to an enormous extent, occasionally utterly devastating the fields on which they alight. They do not take into consideration that if it were the design of Providence that birds should be allowed to multiply in any number for the benefit of man, their extremely slow extension over the country would not have occurred. If sparrows are an advantage, and designed for the benefit of man, what explanation can be given of the fact that it is only at this period of the earth's history, the nineteenth century of the Christian era, that they have become numerous in Scotland, and the same with starlings, which were almost unknown in the north of England even a few generations ago?"

"The persons who plead for the universal preservation of birds, appear to lack reasoning power, but act on sentimental notions only.

"The damage done by birds meets with the slightest

possible consideration from those who clamor for the protection of all species. Few persons nowadays would like the golden eagle, which is now a scarce bird, to be destroyed, but how many take into consideration the fact that formerly large subscriptions were raised to provide ropes for the means of its destruction, as its presence in large numbers caused the greatest injury to the flock masters in the north of England and Scotland? Jardine recorded that in three years more than 200 golden eagles were destroyed in order to protect the lambs of one district, and this as late as eighty years ago. The raven, which is one of the most destructive of all birds to lambs and even sheep, is, in consequence of its exciting the sympathy of spectators, protected all the year round in the Isle of Wight, and in numerous counties the eggs also are protected. The carrion crow, possibly on account of its objectionable name, does not come under the protection of the councils. The number of vastly injurious birds which are definitely protected is very great. Bullfinches are known to be among the worst enemies that fruit farmers and gardeners can have to contend with. The damage done by blackbirds and thrushes is, to say the least of it, enormous."

A Lilliputian Engineer.

SEATED in my log cabin I noticed a commotion at the foot of the washstand. A worm, an inch in length, and of the centipede variety, was thrashing right and left. A spider not larger in its body than a mustard seed, and whose diminutive legs were invisible to the naked eye, was swiftly running along a gossamer strand that led from the head of the worm to the leg of the stand, a foot or more from the floor. Back and forth it speeded along its cable, deftly touching the worm and spinning a new mesh as it returned to its lair, only to again repeat the operation. With every new approach of the spider the worm evidenced fresh symptoms of distress.

Presently I noticed the forward part of the worm begin to leave the floor. The cables were pulling taut or the worm was crawling away, and the spring of the web was carrying it off its feet. Thresh and twist and squirm as it might, the spider journeyed back and forth, making assurance doubly sure with each strand attached to the body of the struggling worm.

I noticed that the worm was fast losing its grip upon the surface of the floor, the last few remaining legs gripping the boards as the rest of the body swung convulsively, now to the right, now to the left, in its vain struggles to rend itself loose. The strain was becoming greater and greater, and by careful watching I noted that the death grip of the worm upon the floor was gradually relaxing, until the hold was finally broken. When, wonderful to relate, it swung free of the floor and began to be lifted nearer and nearer to the lair of the spider. The size of the worm and the gossamer-like strands of the web were so out of proportion that one wonders at their strength. But the microscopic engineer understood his business thoroughly, for up, up, up, the worm went, until the lair was reached, then with a quick movement the spider enveloped the yet struggling worm in a gossamer winding sheet, and all was over.

The spider had supplied its larder, if in doing so it accomplished a greater engineering feat than any involved in the building of the Pyramids or the construction of the Brooklyn bridge. CHARLES CRISTADORO.

Clever Hans.

BERLIN, Sept. 13.—The remarkable horse called "Clever Hans" has just been examined by a special commission of experts, in order that a decision might be arrived at whether it is a horse possessed of extraordinary brain power or merely like many others of its tribe, peculiarly adapted to learning tricks from patient trainers. The commission consisted of the well-known circus proprietor, Herr Paul Busch; Count Otto zu Castell Ruedenhausen, a retired army captain; Dr. Grabow, a retired schoolmaster; Dr. Ludwig Heck, Director of the Berlin Zoological Gardens; Major von Keller, Major Gen. Koering, Dr. Miessner, a veterinary surgeon, Prof. Nagel, of the Physiological Institute of the University of Berlin, and several other prominent men.

The commission has issued a statement declaring that it is of opinion that there is no trickery whatever in the performances of the horse, and that the methods employed by the owner, Herr von Osten, in teaching Hans, differ essentially from those used by trainers, and correspond with those used in teaching children in elementary schools. They hold that the methods employed have in principle nothing whatever to do with "training" in the accepted sense of the word, and are worthy of scientific examination. The report of these gentlemen is interesting, for Herr von Osten had tried in vain to persuade scientific men to take the case of "Clever Hans" seriously. Herr Busch, of circus fame, who was one of the commission, had openly admitted beforehand that he was extremely skeptical about the matter, and believed that the horse had been taught merely to learn a few clever tricks just like other well-known circus horses. Now, however, he admits that he was mistaken.—London Standard.

Another 100 Sportsmen's Finds.

Some of the Queer Discoveries Made by Those Who Are Looking for Game or Fish.

104

ONE of the most remarkable and romantic gold discoveries of which there is any record has been made in New Zealand, as reported in the London Chronicle. A certain Albert Winter has discovered in the Mokihinui district a valuable gold reef. The discovery was made in a remarkable way. Mr. Winter stooped at the edge of a creek to pick up a piece of stone to throw at a woodhen, and in doing so he noticed that the stone was gold-bearing quartz.

Promptly he returned to the town, took out his miner's rights, and with his mate pegged off claims on the ground, and subsequently sold out his interest for £75,000. This is one of the biggest gold finds ever made in New Zealand.

GAME BAG AND GUN

Notes From the Game Fields.

Massachusetts Ruffed Grouse.

PLAINFIELD, Mass., Sept. 27.—*Editor Forest and Stream:* The autumn foliage at date is resplendent, and the leaves are thinning out. I shall hold on here until October 1, so as to get a hack at the grouse. The birds are really quite abundant. During the summer months, in the course of my rambles over the hills, I flushed quite a few beavies, so that I know where the birds are, unless some "sooner" gets in his work before the legal time. When the forbidden period ends, I will just saunter forth on some sunny day when the morning air begins to warm up, and perhaps bag a brace. If a bird gets up before me, I halt to see if there are others. Usually it will not be two minutes before one and then another of the beauties will show himself among the leaves, and on the grass beside the old pasture wall, until a half dozen or more are in sight. Of course I pot my first bird, and if I can drop a second on the flight, my "satisfaction is full," and the day's shooting is done. As I am 70 years old, I don't care to travel far. I do very little hunting between 10 A. M. and 3 P. M. Of course a man hunting all day with a good partridge dog which will stay by, may bag quite a few birds at this opening of the season; but I myself am not much of a dog worshipper, and care little for count. As a rule, sportsmen lose many birds by moving too quick. Even barnyard fowls will fly and scatter if you run in on them.

Now that the berries are about done, deserted apple orchards near a wood lot are likely places to find ruffed grouse in the morning hours, and so are old roads that are little traveled, as well as spring heads in mixed woods of beech, birch, and evergreens; and the birds like worn out pasture lots where the grass is short, and there are droppings of cows. Mast, especially beech nuts, is more abundant this year than last, and there are hundreds of nut-bearing chestnut trees on the Goshen hills, ten miles away. Rabbits and squirrels are few, though the nut crop may bring them later on. It is a long time since I saw a gray squirrel here. Last year I came across two at the cross roads, which were sitting by the roadside, apparently scanning the finger-board pointing away from town. The neighborhood was growing too hot for them, and as gray squirrels migrate in companies, they must have all left these precincts at that time.

CHARLES HALLOCK.

New Jersey's Promise.

LONG BRANCH, N. J., Sept. 30.—*Editor Forest and Stream:* Considering the fact that we have not been able to get any quail for the past two years, the outlook this season is very bright. The old birds seem to have survived and multiplied, due to the vigilant protection of our wardens, and the enforcement of the laws.

I am clearly of the opinion that in every part of the State where game is scarce, if hunting in the closed season were stopped and trapping and snooding were stopped, and the sale of game were abolished, it would become plentiful again.

It is a serious problem with us, situated as we are between two of the largest cities, how to restrict and properly protect our game. The law now in force, which has been practically the same for the past three years, is working very successfully, and reports now coming in show clearly that partridge and quail are on the increase.

It is very gratifying to be able to tell you that the twenty-seven deer liberated last fall are all doing well, and have multiplied, and I have no doubt that after two years there will be good deer hunting in New Jersey.

BENJ. P. MORRIS,

President Fish and Game Commission.

Montana Game is Increasing.

HELENA, Mont., Sept. 28.—*Editor Forest and Stream:* The game conditions of our State have never been better in the last ten years. People who are seriously opposed to game protection, acknowledge the fact that our game is increasing instead of diminishing each year. This season has been unusually favorable for small or feathered game, and our crop of birds this year was indeed surprising. Non-resident and eastern hunters who have been hunting this month have met with great success, and the majority have written me expressing their pleasure and satisfaction with the results of their hunt.

W. F. SCOTT,

State Game and Fish Warden.

Colorado Deer and Grouse.

DENVER, Colo., Sept. 27.—*Editor Forest and Stream:* In regard to the game conditions and outlook for hunting in Colorado this year, the outlook was never brighter. From all reports the deer are more plentiful this year than they have been for years, and there are a great many grouse in different parts of the State. The ducks are not very plentiful yet, as we have had no cold weather to drive them down from the north, but just as soon as the weather gets cold we expect the duck shooting to be very fine. We have a very short open season on deer, commencing September 15 and closing September 30 of each year. No open season on elk, mountain sheep or antelope.

J. M. WOODARD,

Game and Fish Commissioner.

Oklahoma's Quail Supply.

OKLAHOMA, O. T., Sept. 27.—*Editor Forest and Stream:* In answer to your inquiry as to the outlook for hunting in Oklahoma this year, beg to advise that the chief varieties of game found in Oklahoma are quail and

prairie chicken, the latter being found only in the extreme western counties, and are reported not very plentiful this season. Quail are distributed over the entire Territory, and I do not know that any State contains as many as Oklahoma. The supply this year is larger, so far as I have been able to observe, than ever before, and from inquiries I have made, this seems to be the condition over the entire Territory. There are practically no wild turkeys left, and but few deer. An occasional small bunch has been seen in the Wichita Mountains, and a few scattering ones in Roger Mills and Day counties.

J. C. CLARK,

Territorial Game and Fish Warden.

Nebraska's Game Increase.

LINCOLN, Nebraska, Sept. 26.—*Editor Forest and Stream:* We have prosecuted every violation of the law that came to our notice, and have given particular attention to the enforcement of the law relative to market-hunting and shipping of game and fish within or without the State. The results have been very gratifying to all who are interested in the preservation of our game.

Some time ago I requested our special deputies in the several counties of the State to acquaint themselves with the conditions as nearly as possible, and report to me on blanks which I inclosed, the increase or decrease of prairie chickens, grouse and quail, and the per cent. of increase or decrease. I inclose herewith a copy of the table which we compiled, and you will notice from it that the increase under our non-shipping laws have been very marked. While the table is not authentic, it will convince you that there has been a splendid increase.

GEO. L. CARTER, Chief Warden.

[The statement shows an increase of prairie chickens, grouse and quail in almost every county, ranging from 10 to 500 per cent.]

New Hampshire Deer and Partridge.

LANCASTER, N. H., Sept. 29.—*Editor Forest and Stream:* In the northern section of the State the deer are reported to be very numerous, more so than usual. Partridges are also reported to be very plentiful, and I have no doubt that this is true. Our winter was very severe, but the cold was so continuous that there was no crust by reason of thaws, and the birds were thus able to get out and feed all winter long. Then, too, the spring was very dry, and the eggs were not destroyed by the wet weather. Deer and partridges are the principal game hunted in this section, although there are some ducks and woodcock seen in this vicinity.

MERRILL SHURTLEFF.

Tennessee Quail.

NASHVILLE, Tenn., Sept. 26.—*Editor Forest and Stream:* Reports to this department from various sections of the State indicate an unprecedented number of quail, which fact gives promise of unusually fine shooting for the lovers of this sport. The Tennessee game laws invite and do not repel non-resident sportsmen, and are in line with the policy on this subject heretofore strongly advocated by FOREST AND STREAM.

M. L. BEASLEY, Secretary.

North Carolina Quail.

GREENSBORO, N. C., Sept. 26.—*Editor Forest and Stream:* Regarding game conditions and the outlook for hunting in North Carolina for this year, the prospects for good quail shooting have not been better for many years. Observers in all parts of the State are continually reporting on the large numbers of birds which are being seen.

T. GILBERT PEARSON, Secretary.

Connecticut Upland Game.

HADLYME, Conn., Sept. 26.—*Editor Forest and Stream:* It is early as yet to forecast just what the outlook is for hunting this fall in this State, although I am inclined to the opinion that so far as quail are concerned that the severe winter has very nearly exterminated them, but from all parts of the State come reports that partridges are more abundant than for several years past.

E. HART GEER, Secretary.

Quebec Reports Favorable.

AYLMER, Quebec, Sept. 26.—According to reports from fire rangers and fish and game keepers, the game conditions and outlook for hunting this year ought to be very good, as the game is plentiful outside of partridges.

N. E. CORMIN,

Provincial Game Warden and Fishery Overseer.

Iowa Prairie Chickens and Quail.

WARDEN GEORGE A. LINCOLN, who is now distributing fish from the State fish car, writes, under date of September 27: Prairie chickens are scarce, but will be better the last of October and November. Quail are plenty. There will be good hunting during open season. The outlook for ducks is good; there will be large numbers.

Wisconsin's Outlook Good.

MADISON, Wis., Sept. 26.—*Editor Forest and Stream:* Partridges and grouse are very plentiful, and deer are becoming more numerous every year.

HENRY OVERBECK, Jr.

West Virginia Reports an Increase.

HINTON, W. Va., Sept. 28.—*Editor Forest and Stream:* We have plenty of deer, some bear, and an abundance of

turkeys, pheasants, Virginia partridges, and rabbits and squirrels. They seem to be increasing.

FRANK SIVELY.

New Brunswick Big Game.

SAINT JOHN, N. B., Sept. 29.—*Editor Forest and Stream:* The hunting outlook is good. Moose are very plentiful, and there are also abundance of deer and caribou, as well as ducks and other small game.

L. B. KNIGHT.

County by County in Illinois.

SPRINGFIELD, Ill., Sept. 24.—*Editor Forest and Stream:* I beg to inclose you a clipping from the Springfield Journal of September 23, which will give you an idea of the game conditions by counties, and you will please note that nearly all of them show a marked increase, under the operation of the new game law.

JOHN A. WHEELER,
State Game Commissioner.

SUMMARY OF THE REPORTS.

Adams—Pheasants, squirrels and prairie chickens have increased during the year.

Alexander—Quail increasing, and plenty of all kinds of squirrels. Also plenty of snipe and wild turkey. Lots of geese, duck and brant in the fall.

Bond—Quail and squirrels are plentiful. Prairie chickens are increasing since last year.

Boone—Prairie chickens have made a gain. Plenty of rabbits, but partridges are scarce.

Brown—Quail and squirrels increasing.

Bureau—Squirrels, rabbits, quail and chickens increasing.

Carroll—Quail, snipe, squirrels and rabbits plentiful. Some chickens and ducks, but farmers are protecting the quail and chickens very well.

Green—Quail plentiful; also squirrels. General conditions improving.

Case—Ducks, quail, squirrels and rabbits are plentiful. Prairie chickens a little scarce, but increasing.

Christian—Quail and doves are plentiful, but chickens and squirrels are scarce. General conditions increasing.

Clark—Squirrels are plentiful, while chickens and quail are scarce.

Clay—Quail and prairie chickens are plentiful and on the increase.

Coles—Squirrels, quail and prairie chickens are scarce, but on the increase.

Clinton—Quail, prairie chickens and squirrels are plentiful. Some wild turkeys and pheasants, but ducks and snipe are scarce.

Cook—General condition of prairie chickens, quail and ducks is good, but they are not plentiful.

Cumberland—Quail and squirrels are on the increase and are plentiful.

De Kalb—Prairie chickens and quail are not very plentiful, but on the increase.

Douglas—Prairie chickens, quail and squirrels are not very plentiful, but more so than last year.

Effingham—Quail and prairie chickens are on the increase, but there are only a few squirrels.

Du Page—Prairie chickens and quail quite plentiful and increasing.

Edgar—Squirrels and quail are plentiful, but prairie chickens are scarce.

Fayette—Quail in this county are on the decrease, and chickens are very scarce.

Ford—A few quail and prairie chickens.

Franklin—Quail are plentiful and on the increase.

Gallatin—Squirrels, quail and ducks are plentiful and on the increase.

Green—Quail, mourning doves and squirrels are plentiful and on the increase.

Grundy—Chickens, quail, pheasants and doves are plentiful and increasing. Squirrels more generally.

Hamilton—Quail and squirrels are scarce, but increasing.

Hancock—Condition of mourning doves, quail, prairie chickens and snipe is fair, and they are on the increase.

Henderson—Quail very plentiful.

Jackson—Quail plentiful and increasing in the northwestern part of the county.

Johnson—Wild turkeys are scarce; quail are plentiful and increasing.

Jo Davies—Quail, prairie chickens and pheasants are very plentiful and on the increase.

Kankakee—Quail are quite plentiful, but chickens are scarce. General condition increasing.

Kendall—Prairie chickens, quail and squirrels are plentiful in the south and western parts. Condition increasing.

Knox—Quail, squirrels and prairie chickens are quite plentiful. Very few snipe. General condition increasing.

La Salle—Quail are plentiful. Chickens, squirrels and doves are quite scarce.

Lake—Ducks on the decrease. A few prairie chickens and squirrels.

Lawrence—Plenty of rabbits and quail, but chickens and squirrels are scarce.

Logan—Squirrels are on the decrease; rabbits on the increase. Quail and chickens are fairly plentiful, and conditions are increasing.

Macon—Quail, prairie chickens and squirrels are fairly plentiful and conditions increasing.

Macoupin—Quail, chickens and squirrels are fairly plentiful, and the numbers are increasing.

Madison—Squirrels, quail and rabbits are very plentiful. Chickens are very scarce.

McDonough—Chickens, squirrels, ducks, geese, quail, snipe, brant and pheasants are plentiful. General condition increasing.

McHenry—Prairie chickens, snipe, squirrels and rabbits plentiful. Pheasants, woodcock and partridges are scarce.

McLean—Chickens, quail and doves are plentiful; also rabbits. Squirrels getting scarce.

Mason—Squirrels and doves are plentiful and on the increase. Massac—Turkeys, squirrels, quail and rabbits are plentiful and on the increase.

Menard—Condition of quail, chickens, and squirrels is good and increasing rapidly.

Mercer—Quail and squirrels are more plentiful than usual, and on the increase.

Monroe—Squirrels and mourning doves are plentiful and increasing.

Morgan—Quail, doves and rabbits are plentiful; ducks scarce. Moultrie—Quail are plentiful; squirrels and chickens are scarce.

Ogle—Chickens, quail, squirrels and pheasants are scarce, but on the increase.

Pike—Squirrels, doves and quail are plentiful.

Piatt—Prairie chickens, quail, squirrels, rabbits, geese and ducks are quite plentiful and all on the increase.

Pope—Gray and red squirrels and quail are plentiful and on the increase.

Pulaski—Quail, squirrels, rabbits and doves are fairly plentiful and on the increase.

Richland—Squirrels, quail and chickens are plentiful.

Rock Island—Quail, rabbits, squirrels and a few chickens; all are increasing very rapidly.

Saline—Quail, doves and squirrels are plentiful and on the increase.

Sangamon—Quail, doves and prairie chickens are not very plentiful, but slightly increasing.

Schuyler—Quail, squirrels and ducks plentiful; chickens scarce. All are on the increase.

Scott—Quail and squirrels are quite plentiful. Ducks are quite

scarce. All are on the increase. Duck hunting may be good this fall.

Shelby—Prairie chickens and quail are quite plentiful, but squirrels are getting scarce.

Stark—Quail and squirrels are plentiful and increasing; chickens are getting scarce.

St. Clair—Quail, squirrels and rabbits are plentiful, but chickens are scarce. A few turkeys.

Stephenson—Quail, squirrels and rabbits are plentiful, but chickens are scarce. All but chickens increasing.

Union—Quail and squirrels are fairly plentiful, and a few turkeys. All on the increase.

Warren—Quail and squirrel are plentiful; chickens fairly so. Conditions increasing.

Washington—Quail and squirrels plentiful; chickens and turkeys scarce; all on the increase.

White—Squirrels and quail plentiful.

Whiteside—Prairie chickens and quail are plentiful; ducks scarce; all on the increase.

Wayne—Prairie chickens are getting plentiful, and quail and squirrels are quite plentiful.

Williamson—Quail and squirrel are plentiful and on the increase.

Winnebago—Snipe and squirrels are plentiful; chickens and quail fairly so; all on the increase.

Woodford—Prospects for chickens and quail are good in this county.

Guns and Gun Feats.

HOT SPRINGS, ARK.—I have been more interested in this controversy than any that has yet come to my notice. I am sorry to see good and clever men disagree. Not that there can be any objection to any man's having a polite opinion opposite that of another equally polite man; but for a man to say he is sure a thing can not be done, after some other has declared that he has seen it done, or has done it himself—well, now, that is a little unkind, is it not? I had intended to keep out of this discussion, but Josep Kingsland, on page 223, has given me a hint that will, I believe, enable us to begin to untangle the whole array of seeming contradictions; at least regarding the squirrel barking; while as for the candle-snuffing, a feat I had myself feared to be impossible, a man has just left my desk who declares that he has done it repeatedly, as did also his elder brother, and with an old-fashioned Colt's revolver, too! It is a small caliber powder-and-ball weapon, still in his possession. I have seen it several times.

This man is modest, honest and truthful, respected, and believed by everybody, and his age is somewhere about 70.

I have such confidence in him that I will give his name—Thos. Tyrrell—and add that his address is; as mine, Hot Springs, Ark. His brother's address is Nick Tyrrell, Pelican Rapids, Minn.

They did their shooting in an old log house, in Iowa, twenty years ago; but I know Thomas to be a keen shot, and believe he could still snuff the candle without extinguishing the light—occasionally, under favorable conditions.

They shot at their candle at a very short distance, 'tis true—only about 18 feet, but the fact that it could be done at that distance with such a weapon ought to go a long way toward silencing too hasty condemnation of Audubon's account; for the long rifles in that case, well kept as the apple of the eye, treasures more valued than all else in their possession, and the men who shot them being as inseparable from them as the men's own shirts, ought to have given conditions for ideal performances. What if the sights were inferior to the best now in use? The fact is that constant, earnest practice with no sights at all, might result in better shooting than busy, rushing modern men could hope to show with the best of sights. There are young men here who can throw rocks and strike small objects 100 feet distant that many a city visitor could not hit with the best rifle—and what "sights" are used in throwing?

Mr. Tyrrell admits that the light went out whenever they struck it too low, but firmly declares that when the charred point was struck, the wick was trimmed without injuring the flame. And I now believe the trick can be done again, although I have not yet tried it myself. But I don't claim to be a great shot, though I have (accidentally, of course), done some very respectable shooting.

The greatest difficulty in the way of my belief in the candle-snuffing, was the supposition that the bullet would be followed by a whirlwind of air violent enough to put out any small flame; but it seems that the air disturbance goes past almost as quickly as the ball, merely causing the flame to divide an instant, then suddenly unite again in the dead calm that immediately succeeds. It's no use to say it can't be done, for thousands of things even more improbable (theoretically) are done every day. In these times when scientific marvels are so common as to seem almost monotonous, I'd rather appear too credulous, even of long past exploits, than skeptical enough to try to hinder progress.

Now about the squirrel barking. It seems that the unbelievers are inclined to treat the subject with levity—which is the same as to say they are not in the proper mood to receive evidence that might convert them. But they, too, have been mercilessly ridiculed. I need refer only to the treatment received by Allen Kelley on account of the difficulty he encountered in killing a certain squirrel. Now, gentlemen, be funny, if you like, but at the same time try to be fair. Every person of experience surely knows that a squirrel is sometimes amazingly hard to kill (I'm going to give justice to Captain Kelley if I am "agin him"), especially if only slightly injured at first shot. Why a wounded animal should average harder to kill than an un-wounded one, I know not. I only know that such is the case. Probably the first hurt arouses some latent force in the vital principle which, angered or alarmed, opposes at once vastly multiplied sustaining powers. I could name numerous instances of wounded hogs, cattle, etc., that seemed well-nigh impossible to kill. When I first began hunting squirrels I thought cats weren't "in it" at all in the matter of lives. Two separate red squirrels I shot eleven times each before bringing them down. I'm not ashamed to tell it, because I had to do fairly respectable shooting to hit them at all, the timber along the Little Wabash being very tall, and the tough old veterans knowing how to keep themselves concealed so well that I was compelled to shoot, if at all, at the mere tip of a tail, or a line of hair on the back, or take chances through a small limb, or fire into a bunch of leaves by guess. I never liked to let a wounded animal escape to die a lingering death, so I kept popping away at them after seeing blood. To describe the condition of one (after it came down) is to nearly describe both: one

shoulder broken, one wrist ditto, one ham shattered, one hindleg smashed at the lower joint, a hole through one ear, or rather a semi-circular notch in the tip of it; one jaw smashed, a bruised, if not broken, backbone; one side pierced, the bowels torn out, and other lesser wounds. All this mischief was wrought by large buckshot from a long, heavy muzzleloader, octagon barrel, full stock, percussion cap, set trigger rifle. I had other harrowing adventures with the little rodents almost as disgusting.

But in spite of all this evidence of tenacity of life, I unhesitatingly agree with those who aver that squirrels can be barked. Perhaps not regularly, but occasionally. I know that I have shot under two, at least, and brought them down, and could find no wound upon them until I removed the skin. Even then one of them showed no bruise. The other had a very bloody spot, about 3/4-inch in diameter, on the belly, and on the inside of the hide that had covered that part, though on the outside not a hair appeared turned.

Now to the idea I get from Mr. Kingsland: It seems that the bullet passing under the squirrel's body must either strike at such an angle that it will flatten and violently rebound against some vital portion of the body, or else tear off a strip of bark or splinter of wood and force that with a slap against the body strongly enough to stun or kill; and a large strip striking flatly against a certain spot on the belly, just back of the ribs, will certainly produce sudden death, even if the blow is comparatively weak. A slap of the open hand upon that spot on even so large an animal as a horse might prove fatal, and at the same time leave no outward mark. I admit that there is still considerable uncertainty whether any man could acquire sufficient skill and judgment to intentionally bark squirrels and win oftener than fail (I barked mine without ever having heard of such a feat), yet I believe that Boone did just as stated by Audubon, whether he was able to often repeat that performance or not; for he was so constantly with his weapon, and so constantly in the woods among the squirrels, that it would be rash to put a limit upon his prowess short of known contradiction of natural laws.

That it—squirrel barking—has been done, incidentally or unintentionally, by many individuals, has been so abundantly testified, that I will add but one more name to the list of squirrel barkers—Harvey Armond, a young neighbor, who says he has gotten several in that way.

And since there has been so much insinuation against old-time guns, let me add this: I have, in an honored place over my front door, an old rifle like the one described, with which I am sometimes unable to hit an object the size of a big squirrel only twenty feet distant; yet with that same "shootin' iron" I have brought down squirrels from a height of 100 feet or more, and so concealed that I was compelled to get an equal or greater distance from the tree to discover the faintest line of the squirrel's back, as he pressed close to the limb. And I have not killed a "carload" nor even a small wagon-load of these little "varmints" in my whole career. So what might not have been done by one like Boone, who must have fired hundreds of shots to every one of mine, and who probably kept his rifle in the best possible condition?

L. R. MORPHEW.

Game in Sierra Nevada Mountains

WE will begin with the mountain quail. They are a little larger than the eastern Bob White, darker in color, and a little more upright in their carriage. Their call bears no resemblance to that of the eastern quail or Bob White, but is a single short, sharp cry repeated at frequent intervals, and resembles the last note of a cackling hen. As the little fellows are very plentiful here, this call or cry is heard in every direction morning and evening. Next come the grouse, which are the same bird we know and love so well in the East. But the sage hen is something entirely new to an easterner. They are a magnificent gray bird, from five to six pounds weight, and bearing some resemblance to a wild turkey in their habits. They frequent the barren peaks above the timber line, their only cover being the low sage brush, upon which they feed, as their name implies. They are an easy bird to approach, and when flushed, make but a short flight, and as there is no timber where they are found, they are easily marked down and flushed again as often as desired. They are very plentiful, and offer grand sport to the bold Nimrod who has the hardihood to mount the barren mountain tops they frequent. Ducks of every variety frequent all the streams and lakes or ponds of the valleys in fall and winter. They leave their breeding places in the mountains when cold weather sets in, and flock to the valleys, where they remain until spring. The beautiful mallard, the rare and valued canvasback and widgeon; in fact, all the most valued varieties, are found here in abundance unless we except the redhead. I have not seen any of those as yet. Geese also are plenty all winter, and feed on the grain stubble in the valleys in great flocks. There are also a few deer, but not so plenty as I have seen in the Adirondacks and other places. So, to sum it all up, an all-round sport and fisherman can find plenty to do to keep him interested all the year around in these grand old mountains and lovely valleys.

But perhaps the greatest attraction which this section has for the weary man of business who finds, when too late, that in his race for riches he has drawn too heavily on nature's resources, is the wonderful health-giving properties of this dry, cool atmosphere and high altitude. Mark Twain quaintly says, in describing it, that the pure air of these mountains would restore to life an Egyptian mummy. There are many like the writer, who find their health failing, but hesitate to cut loose from all manner of business and lead a life of idleness. To such I will say that the mineral resources of these mountains offer greater opportunities than can be found in the crowded cities of the East. These hills are full of valuable mines of copper, lead, silver, and gold. There are perhaps a score of such mines within a few miles of where I write. Some of them are now being successfully operated by eastern companies; others are owned by the original miners and prospectors who discovered them, and are as yet undeveloped, and can be bought very cheap. The Longfellow Company, of Cleveland, Ohio, are operating a gold mine within one-half mile of where I write, and a few days ago they struck a vein of ore in their main ledge which assayed the fabulous sum of \$83,000 per ton.

Samples of this ore were sent to the secretary of the company, Mr. Carman, of Cleveland, which he had assayed with above results. But I am informed that there is no stock for sale by this company.

The above strike is what is known as a pocket or very rich spot in the ledge, and never extends far, but these finds help up the general average. But I started out to tell about our game, and have wandered away among mines. Well, I will let it stand as written; perhaps it may be of interest to somebody.

S. H. THOMAS.

GARDNERVILLE, Nevada.

Days with the Wildfowl.—I.

"I WOULD rather kill one of those birds," remarked Gerard, as he stepped over the gunwale and took his seat in the bow of the boat, "than any bird that flies," and he glanced up where the long line of cranes were streaming across the blue vault, now almost white against the background of a floating cloud, now bluish-gray where they sailed along at the cone of the fleecy pile, now dark where their course lay under the riant skies.

"Did you ever kill one, Pop?"

"Yes, indeed, many and many a one, and long before I came to Nebraska, too. In the early 70's I did a good deal of shooting in the early spring and fall at Beaver Lake, in Indiana, some twenty miles north of Kentland. Dr. Boerstler and I used to run out there from Cincinnati, and in those days the flight of crane equalled that of the geese almost; and when I first came to Omaha, they were very abundant in this State."

"Where did you have to go for them?" inquired the boy, as we slowly pushed our way through the devious channel out toward the open water again.

"Well, they were especially plentiful out north of Rogers, and in the late fall stupendous flocks dotted the plains and slopes along the Platte."

"Listen!" and Gerard chopped my remarks right in two in the middle, as with with uplifted hand, and tilted head, he seemed to concentrate all of his faculties into that of hearing.

Shoving the push-pole deep down in the mud I stood still as death myself and, notwithstanding our sandhills had dwindled into the veriest specks in the distance, that same weird, guttural "grrrrrrroooooo!" came in quavering cadences through the sunlit air back to us and, as if charmed, we listened and listened until it sounded like a spirit voice in the heavens.

"It must have been a grand sight in early days to have seen those birds like you have seen them," finally resumed Babe, as he dipped his paddle and we started on again.

"Yes, indeed, it was. The fall I was out north of Rogers with John Hardin, back in '88, no '87—yes, that was the fall of 1887, I saw the birds in greater abundance than ever before. Far and wide, when the sunlight in the early morning played upon a thousand shades of green and yellow, they stood upon the rising knolls, now blue, now almost white—according to the play of the light—but always vigilant, always alert, always watching for danger. At night, when we lay in our tent, their rolling notes fell from the starry heavens in unearthly vibration, and by day, with broad wings and long necks outstretched, they floated across the blue dome with such easy grace and so high above the ducks and geese and all other birds that they seemed to belong to the celestial regions rather than to those of this terrestrial sphere."

"When did you kill your last sandhill?"

"Well, the last one I helped to kill, for Tom Foley and I both shot at a passing flock of three, and one fell, and of course we both claimed that we shot at the hapless bird, and we probably did. Anyway, I know I did, and as Foley is one of the most voracious sportsmen I have ever shot with, I have no reason to doubt that he did, too. That was in the autumn of 1898, up on the Lake Creek marshes."

"Where were you?"

"We were in a blind 'way out in the middle of the marsh, and these three birds passed us, flying not fifteen yards above the tules. The bird we knocked down was not killed outright, however, and after he had been hit, he continued on with his mates for two or three yards, and, before it fell, it was a touching scene Tom and I were treated to."

"How was that?"

"Why, when our bird, which was the middle one of the three, began to fall behind his companions, settling lower and lower with slower stroke of wing, the other two came falling back and, going to the side of the stricken one, seemed trying to cheer and sustain him on his hopeless way. Yet slower and more feeble became the great bird's stroke of wing, and more and more he dropped toward the top of the arrowy tules, with the other two clinging tenaciously to the last hope of saving him. But, suddenly, there was an alarming lurch, a spasmodic flap of one wing, the long neck folded, and the wounded bird let go all at once and fell dead into one of the shadowy crypts below. With a melancholy 'pur-r-r-rut' or two, his two friends shot up into the sky and left him to his fate."

"When we saw him go down Tom and I were wildly enthusiastic, for every morning it had been the ambition of every man in camp to kill a crane, and each had made scores of futile efforts, and now, when we realized that we had accomplished the coveted feat, our joy and triumph was boundless. We both tore out of our blinds and through the dense tules like a couple of wild men, each eager to outstrip the other, and first lay hands upon our prize. But that satisfaction was left for another. In our excitement in watching the uncertain flight of the wounded crane and his two companions, Tom and I had both failed to properly mark the spot where he finally fell, feeling, perhaps, that there was no especial care necessary, as it certainly would be no very difficult task to locate such a hulking carcass as a big, fat crane, especially on that broad and unbroken expanse of brown vegetation. But we had reckoned without our host. Search as closely and diligently as we might and did, we did not find him. We did pick up a stray crimson-stained feather or two that had undoubtedly fallen from his fluffy and wounded

side; but the bird itself we could not discover. We searched for over an hour, in fact, until it was almost dark, beating down several acres of dead tules and withered flags, but all to no avail, the bird could not be located. While we were looking for him the ducks flew by and over us in myriads, but so intent were we in searching for the sandhill that neither one of us took a shot, until finally, in deep disgust and mortification, we were compelled to give it up."

"And you never got him?"

"Oh, yes, we did; Charlie Rogers and Scrib were shooting from the same blinds the next morning and, coming out about 10 o'clock, Scribner ran across our crane, lying flat, in plain sight in a little open glade in the tules, stone dead, with his long neck doubled back over his shaded back and his long lavender wings fully outstretched. By our track, Scrib said that he saw that Tom and I had tramped by the bird, within a dozen yards of where it lay, a score of times, and as he found it and Rogers carried it into Camp Merganser, they, too, had the gall to claim a hand in our triumph."

"Well, as long as you finally got the bird, you didn't care, did you?"

"No, not particularly; anyway, all feeling disappeared that night as we gathered around old Abner's table and feasted ourselves to bursting, almost, on roast sandhill crane. I can taste it yet."

"Good?"

"Good? That's no name for it. It was a young bird, fat as butter, and Abner had him dished up in a style that would have made the Waldorf Astoria's chef turn green with envy. Young turkey, with chestnut and oyster dressing, wasn't in it with our crane and the wild sage and onion stuffing with which Abner served it. I thought Charlie Metz and Billy Marsh never would quit eating. But here we are. Let's string the decoys a little further around the point this evening, where the birds coming from the west can see them quicker. From the way they are moving up the lake, I think we are going to have some great fun this evening. There, reach that decoy with your paddle there, and pull it along till we get round the point; I'll gather these in front of us."

"Before we get ready, Dad, I want to ask you if you don't think the sandhill is the greatest game bird we have ever had in this section of the country?" and Gerard began pawing at the nearest decoy with the flat end of his paddle.

"No, I do not. I even think—look out there, you'll throw me into the slough if you lean over the boat in that manner—I even think he is not in it with the wild goose, and so far as comparing him with the whooping crane, he is as far beneath that bird as he is superior to a sawbill."

"The whooping crane? I don't believe I know the bird you mean. Are there any of them round here now?"

"Yes, sometimes. But they are almost as thoroughly extinct, so far as Nebraska goes, as the buffalo or wild pigeon, although Bob Low came within an ace of getting a shot at one last fall down near Clark's Lake, south of Omaha."

"Then they were once plentiful here, too, like the sandhill."

"Just as plentiful. In fact, when I came to Nebraska they were to be encountered almost as numerous as the sandhills. They are larger by at least ten inches in extent of wing and eight inches or more in length, and have always been considered a rarer and more valuable bird. They are as white as a swan, excepting the several inches of velvet black that tips the wing; and when floating in the bright sunlight of Nebraska's clear air are the most beautiful of all big American game birds."

And you say they were quite numerous, too, when you came here?"

"Yes, very, and as late as March, 1894, Bill Simeral and I killed two out north of Goose Lake in Deuel county—the spring we made that big kill of canvasback."

Canvasback. I haven't heard you speak of that hunt. I don't believe. How many did you kill?"

"Well, canvasback and redhead, but principally canvas—we brought back to Omaha exactly 604 birds after a ten days' shoot, this number including the two whooping crane and seven swan. That was never duplicated—that is, in the high character of the birds—by any two hunters in the history of Nebraska. But I'll tell you about that later; just now I want to tell you about the crane—the whoopers. While they were abundant in the sandhill country, I never heard of many being killed here—hunters were always contented with geese and ducks, probably, however, because the whooping crane is about the hardest bird to approach in the world. He is as keen-sighted as an Andes condor and has the most acute hearing of any animal I ever hunted. They are great fliers, and when in the air circle much of the time so far in the zenith that they seem but bits of down, and send through miles of air a note both wild and strange, ringing as the blast of a silver bugle, it is almost a hopeless task to get a shot at one. They—well, isn't that gall for you? I'll kill the drake on the water and you take the hen when she rises."

A pair of redheads, gliding onto us and into the water as noiseless, almost, as disembodied spirits, had dropped right into the midst of the decoys behind us, apparently unalarmed at the tones of my voice and perhaps unaware of our proximity, and calling Gerard's attention to them, I cracked away, and the old cock dropped his bright chestnut head and fell over on the water, kicking spasmodically, and the Kid knocked down the hen, as with an affrighted squeak, she leaped into the air and sought to get away, whirling right toward us and over our heads. But she calculated without her host. Gerard's first barrel cut a handful of feathers out of her ashen tail, and the second sent her plunging dead on a long slant into the glistening tules.

"Well done!" I cried.

"Nothin' at all surprisin'," answered he, "I had in one of those long-killing shells of yours."

Even before we had a chance, after downing the pair of redheads, to push our boat back into the covert of tules, another pair of ducks, baldpates this time, came skimming down the channel just above the surface of the water. Gerard and I both saw them at the same

time and, deeming any warning supererogatory, we both crouched low down on the hay in the boat and waited for them. The boy being in the bow of the boat and nearest the channel, I whispered to him to take the leader and I would attend to the one in the rear.

They were soon opposite us, and the reports of our Parkers followed each other in quick succession. So quickly, in fact, that they almost blended into one, and two white-crowned members of the wildfowl family lay struggling hopelessly upon the water.

"Oh, no, we aren't shooting a little bit this afternoon!" ejaculated the young sportsman in an effusion of exultation, as he broke his gun and slipped in another brace of shells. "Two doubles, on single birds, in less than three minutes, looks as if things were coming our way, eh?"

"Yes, indeed, it does," I replied, "but then all the signs point toward a good flight this evening as I told you—but, heavens and earth! look at that line of mallards coming down over the hills! Push! Gerard, push! Let's get into the tules—they are coming straight our way!"

And tugging and pushing and pulling like a couple of Trojans, we soon had our boat tucked well back into a labyrinth of tules and, stooping low, I gave a loud quack on the caller, thrice in rapid succession, then waited.

As long way off as they were, I saw that I had attracted their attention. In those low sandhill valleys a caller can be readily heard for easily a mile, and by the birds in the air I think a good deal further. Anyway, the bulk of the approaching flock had heard my signal, for as they came on over the lake, they came down with a rush, and when I uttered the chattering notes of an old hen, the fragment of the flock that had deviated a trifle to the north, turned and followed the main bunch. When about 200 yards away, they all swerved a little, the way of all new-comers when approaching an unfamiliar line of rushes. I called when they swung off and chattered as they turned again, and down they came on a line like a charge of impetuous dragoons, with long green necks stretched to their utmost tension and heads gleaming like flashing gems in the slanting sunlight.

They cupped their wings and dropped their brightly-colored legs, and three birds, some yards in advance of the main line, like generals leading their troops, alighted right in among our decoys before the others had bunched sufficiently to give us a good rake at them; but Gerard was slightly unbalanced by the advance of the long line of glorious birds, and he arose and let drive among them a half minute too soon. Then there was a whirl and a wild scramble in the air, which seemed filled with thumping wings sheering upward and outward amid a weird chorus of affrighted cries, while at the crack of the Kid's first barrel a whirl of green and gray and black strikes the weedy waters, two birds falling right together, and at the report of his second barrel another white-collared neck droops and another pair of wings are folded. I was a bit slow, but in the aerial riot, I caught two with my right as they crossed, and got another with my left as the last stragglers were rapidly crossing the danger line.

Breaking my gun, I stood watching the scattered flock gathering together again far up the lake, and they at last united in a big bunch and went with the wind off over the hills toward Hackberry, where some of our party probably awaited them. I could not refrain from remarking, nettled a little, you see, at having such a grand opportunity spoiled by the impetuosity of the boy:

"A trifle premature, Gerard; if you had only waited a—"

"Oh, get out! What do you want, the earth? Didn't we knock down five? Could reasonable man ask more?" he got back with some acerbity.

"No, indeed; but that isn't the thing. There is a proper time for shooting at a flock of incoming mallards, as there is a proper time for everything else. We killed enough of them, to be sure, but I wanted you to see those birds when they poised stationary in the air before dropping into the water. They would have all stood on their tails, as it were, until satisfied that the three birds that had already alighted had not made a mistake, and that, with a tremendous flock like that was"

"There must have been a hundred of them!"

"Fully. And I say, with such a flock the spectacle would have been one you would have remembered to the end of your days. I saw just such a picture back on the old Kankakee over twenty-five years ago, and I can close my eyes now and see it again, just as vividly as I did that glorious March morning so long ago. But, look out there! Knock that bird down; don't let her get away!"

"And as I spoke, a big old hen mallard came around the south point of the rushes and was about to settle among the decoys, when she caught sight of us, and turning swiftly, was putting as much space between her and our blind as her terror-stricken wings would permit, when the lad swung on her, and down she tumbled among the smart-weed with a broken wing."

"Well, you got her; but she is only wounded and I don't think we will be able to retrieve her. But what do you say? Let's try it. There seems to be a lull just now, and as a number of our dead birds have drifted out of sight, I think we will profit by running out and gathering them before the final round-up this evening. But aren't you handing it to them; think I'll have to match you against Billy Townsend when we get home, and if we could only spring ducks from the trap, I'd back you for the money. Push now, altogether; we'll soon be out. There we are out, all right. Now, Gerard, you pick up the dead, and I'll do the pushing."

"All right, then, push over there among that smart-weed, and we'll try for that old hen first."

Accordingly I slowly poled the boat, bow first, over to the line of the weeds, which formed a thin brown wilderness along this side of the channel. Gun ready, Gerard was on his knees carefully scanning the line of dead growth as we slowly floated along the selvedge. Failing to discover her, I said:

"She is right here; now let us both look sharp, while

I hold the boat still. These old hen mallards are about the cutest birds of the whole family, and a wounded one is a tough proposition to solve. She has probably immersed her body, and is lying still; but you can depend upon it, her greenish bill is above the water, concealed, maybe, by some clump of this pepper grass, and keeping her yellow eyes on us all the time. Hold on—still now—I think she is right under that little bunch over there," pointing with the pole to a small cluster of the brown leaves, which were blacker than the rest, showing that they have been lately soaked in the water when the old hen immersed herself. "You see how light the leaves are all around those—well their color has not been changed by a sudden bath in the water. I'll push you right up close, then take a whack at the bunch with the flat side of your paddle, and if she is there we'll soon find out."

Depositing his Parker on the hay, Gerard seized the paddle, and when within striking distance, he brought it down on the clump of smart-weed with a loud smack, crushing them down into the water, and sending circlets of waves radiating away in all directions.

Immediately following there was a violent commotion within the aqueous tangle, and the next instant the rufous back and snake-like yellow head of the old hen showed themselves above the surface, and a second quick blow from the paddle stretched her two brown wings out on the surface, and her short tail feathers, sticking almost straight up, twitched and trembled in a way that plainly told that she was good as a dead duck.

Another little push on the pole, and the Kid reached over, grabbed the mallard by the neck, shook the water from off her plumage and cast her back at my feet on the hay, and again picking up the paddle, we started back to where our dead were floating.

SANDY GRISWOLD.

The Horns Must Show.

COMMISSIONER H. G. THOMAS, of the Vermont Fish and Game Department, has sent out to wardens a notice embodying the ruling of Judge James M. Tyler in the case of State vs. Elmer E. St. John at Rutland Term of Court, March, 1904, for the illegal killing of a young buck in open season. After the evidence had been submitted, the court said:

"Gentlemen—The view of this case that suggests itself to us upon all the evidence in the case, and upon the testimony of the respondent, is, that the deer had no such horns as gave notice to the hunter that he might shoot it. That is a short statement of our view of the law. In other words, the horns must be visible—not merely that they can be discovered by a bunch after the animal is killed, but they must be visible so that they are noticeable to the hunter that he may kill him in the open season. So, unless there is some other question, we shall so hold the law to be."

Mr. Moloney—"There is no question about the act of shooting, but we claim it is for the jury to say."

The Court—"We are inclined to construe the statute in that way, as we have indicated; so we shall instruct the jury that if they find that this animal was shot as the respondent himself testifies, and the horns were not so visible that he or a hunter going along could see these horns and have notice by them that he came within the statute, he had no right to shoot him."

Following the expression of this opinion, the jury returned a verdict of guilty, and St. John was fined \$100 and costs.

Commissioner Thomas notifies wardens to govern themselves by this decision, and to take pains to notify hunters that if they shoot deer where the horns are not visible, they will be prosecuted according to law.

Bullet Molds.

WILLIAMSPORT, Pa., Sept. 26.—*Editor Forest and Stream:* The bullet mold described by Mr. Hardy in the number of September 3, interested me very much, especially as I am in possession of a similar stone mold, which, if not a duplicate of his, is certainly a very close relation.

My mold has been in a family of Pennsylvania Germans whose ancestors immigrated to America about 200 years ago, and came from Bavaria.

The stone has about the same color and density as the oil-stones carpenters use to sharpen their tools. The dimensions are as follows: Length, 6 inches; height, 1½ inches; width, 1⅞ inches; weight, 14½ ounces. One of the high sides has entrances to six casting holes, the largest of which appears to be about 18 to the pound, each successive hole getting smaller. The opposite side has eight holes, with gradual reduction to about the size of a No. 2 buckshot.

I think that this mold was first owned by poachers, or perhaps was used during war by the country people.

The holes were evidently made by tools owned by gunsmiths, which were used by them to drill out the regular bullet molds made of iron.

AUGUST KOCH.

The Duck's Scenting Power.

ST. PAUL, Minn., Sept. 27.—*Editor Forest and Stream:* Did you notice L. F. Brown's statements regarding the power of the *Anas obscurus* to "scent" man? Now will the doubters as to the olfactory powers of the duck be good? Unconsciously Mr. Brown is pleading my cause as against Coahoma. I tell you, truth (and Limburger, if not below the frost-line) crushed to earth will rise again.

CHARLES CRISTADORO.

Ten Little Rattlers.

WHEN a Springfield taxidermist left his place of business last night the sole occupant of his show window was a rattlesnake captured on Mt. Toby about two weeks ago. This morning there were, to his surprise, ten additional rattlers of diminutive proportions which evidently had made their appearance during the night. Each little rattler was about a foot long. The mother rattler is twelve years old, as indicated by her rattles.—Boston Globe.

SEA AND RIVER FISHING

On Capon Again.

WITH the plaintive cry of the catamount, the musical murmuring of the riffles, and the splash of the bass still in our ears, the Shenandoah Rod and Reel Club, composed of Charlie Brown, Carson and Dorsey Yeakley, Al Cline, and our mascot, little Jack Greenwalt, better known as "double hitter," are yet dreaming of their camp on Capon this year.

We left Winchester town on August 1 from Grant's livery, where we had been discussing camping and fishing for the last month. It was after 10 o'clock, P. M., when we got out of town and on to the blue pike, and as we jogged along recollections of our former trip to Capon two years ago came to our minds. We all distinctly remembered what a big time we had riding on the hay ladders, and how we had to get off every now and then to get our inside machinery in the right place again. Arriving at the river, we saw that it was muddy, and knew there would be no bass fishing for a few days anyhow. Going on up along the river we stopped at old Break Neck Spring, our camping site. Before long the smoke from our stove was mixing with the Capon River fog, and the delicious odor of coffee perfumed the atmosphere about us. After breakfast we got the camp in shape. Some were driving tent pegs, others making tables and benches, and Dad Yost, who came up with us to take the team back, wanting to test his piscatorial abilities before starting back, had taken "double hitter" and gone up the river. Before long we heard the kid yelling at the top of his voice, and looking up we saw Dad coming, holding at arm's length an enormous turtle. The old fellow was snapping and kicking like a steer, but Dad had him hooked fast, and brought him on to camp, and put him into a box. We told Jack if he didn't be a good boy now we'd put him in with the turtle. Jack was a good boy.

After supper that evening Dorsey Yeakley got out the cards and said, "Come on, let's have a game of pitch."

into the main river you could see them. Off from Calico Rock Billy Ryan and Lou Winkley could be seen, and just below them Carson Yeakley and Charley Brown were trying it from the bank. Maury Patterson had gone up the river a short distance, and running across Uncle Johnny Hiatt, had stopped a few minutes to listen to one of his famous hunting trips. Dave Patterson was in his glory out in the riffles nearby, and Harry Hardy was somewhere—you couldn't see him—but when he did show up, he had some. Away down the river, almost to Maple Landing, you could distinguish Mr. Affleck (better known to the boys as Uncle Scott), working hard out in the riffles. Mr. Affleck says the only way to get them is to go out after them.

Sunday had rolled around, and Quartermaster Dorsey Yeakley gave his ultimatum that there was to be no fishing. That settled it, although I do not mean to say anyone would have fished had it been otherwise. Even the telephone office was closed, and from the appearance of the receivers the next morning there must have been a good many calls that day.

On Sunday we had a visitor in the person of Mr. Granville Chapman, of Slanesville, W. Va., who is what you might call an honorary member of the Shenandoah Rod and Reel Club, from the fact that he so seldom gets to go with us. He is a member of our camp, but only gets with us when we go to Capon, which is about eight or nine miles from Slanesville. We are always glad to see Granville, because he seems to enjoy himself, and is so glad to be with us. "Talking about 'white people,'" as one of the members of the camp below us said, "Granville Chapman is as white as snow." He came down to the camps several times while we were there, and always filled up his buggy before leaving. In the afternoon Mr. Chapman, Charlie Brown, and Carson and Dorsey Yeakley made a trip to a diamond mine—at least they started for it—where it was said you could get diamonds as big as your head. Well, they started out, each with a long

soon asleep, with nothing to disturb our slumber save the rolling of the riffles, bidding us a last farewell, and seeming to say:

Come back, come back, some other day,
When the bass can see and want to play.

We pulled out the next morning about 9 o'clock, and stopped at the telephone office to answer a long distance ring from a big turtle on the other side of the river. We got him, put him into a big bucket, and brought his turtleship on to town.

AL. CLINE.

WINCHESTER, Va., Sept. 21.

Fly-Casters and Bait-Casters.

PITTSBURG, Pa.—*Editor Forest and Stream:* Mr. Kenneth Fowler's communication, which, with its title, "Belgrade and Some Digressions," was published in *FOREST AND STREAM* of October 1, I read with some amusement. The amusement was derived from the exceedingly comic pen picture which he drew of those who presumably enjoyed his society during his fishing trip, and who were unconscious of the public ridicule with which Mr. Fowler's pen would glorify them later. I have also learned from Mr. Fowler that your true fly-fisherman, distinguished from his fellows by "the great line of demarcation" * * * "which divides the fly-fisherman and the bait-fisherman" by virtue of much self-laudatory vainglory, is warranted in having the quintessence of sport with fly and fish and also with his pen, with which he impales his companions, and holds them up to public ridicule.

Humor and wit, or the attempt at such, have their proper times and places among friendly groups. However, the publication of the peculiarities of one's companions for the edification of the world at large, seems to me to be an act of doubtful taste and no wisdom.

But my purpose was to dissent from Mr. Fowler's class-

HARDY CAMP.

SHENANDOAH ROD AND REEL CLUB.

The old torch was lighted, we gathered around the table, and once more we were enjoying a game of cards in camp. The members of the club never play cards only when they go camping, and then we really do enjoy a game under the light of the old camp torch.

There was no fishing the next day, the water was still muddy, and it stayed muddy the most of the time we were there. "Well," said Carson Yeakley, "let's stretch the telephone line across the river; if we can't catch bass, we can catch other kinds of fish." We got out the wire and stretched it across, putting the receivers about six feet apart, and kept open office both day and night, but we missed a great many night calls, because there was no one to answer them, and the callers got restless and rang off. We worked it all right during the day, and collected quite a good deal of fare.

Thursday another camp from Winchester was expected, composed of Messrs. David and Maury Patterson, Louis Winkley, Harry Hardy, Will Ryan, and S. A. Affleck. About 6 o'clock we heard the rumble of their wagons, and pretty soon the procession came in sight. They stopped a few minutes at the spring to refresh themselves, and then proceeded on down the river, expecting to pitch their tents about five miles below us, but they found the road so rough that they had to turn back. They put up camp a short distance below us, so we were practically all one big, jolly camp.

And I must not forget another camp, that of the Idlewild Fishing Club from Paw-Paw, W. Va., who were stopping about a mile above us, composed of Misses Huldah Gross, Lillie Robinette, Minnie Gross, Mamie Loy, Lillian Moser, Mr. and Mrs. Joseph Largent, Carl Conway, R. J. Largent, Oliver Wentling, and Charles Moser. We had the pleasure of several visits from this camp, and it is needless to say that the Winchester bachelors often found time to lay aside their beloved fishing tackle to call at the Idlewild camp and enjoy the company of these charming girls from West Virginia. They were all good anglers, and could cast a bait with the ease and grace of Harry Hardy. They had been there about a week before we came, and were to leave the following Sunday.

The next morning both camps were out fishing, and from Twinkle Spring clear to the Ford, and on down

club with which to keep off the wildcats and rattlesnakes, and as a helper in climbing the mountains. Along about 6 o'clock they straggled into camp, and a more disgusted lot you never saw. About 4 o'clock a terrific thunderstorm had come up, which made their trip all the more disagreeable, but they kept on, climbing mountain after mountain, expecting every moment to have their eyes dazzled by the glittering gems of the diamond mine. They finally gave up the search and retraced their steps, soaked to the skin by the rain, and footsore and hungry. It wasn't safe to say anything about diamonds the next day.

"Double Hitter" caught his first bass this year, and it was a sight to see him land his fish. He was figuring around on the rocks off Break Neck as to where he should throw in. He finally concluded to try it by an old tree which had lodged in the riffles. After putting a nice big fat worm on his hook and spitting on it, he said: "Now, I guess I reckon that'll get you," and quietly waited for developments. Presently Jack's cork disappeared. He grabbed his pole and commenced to pull, but having right smart line out, he couldn't manage it, so he threw down the pole and tried it "nigger" fashion. He got himself, line and fish tangled up in the branches of the tree, and when he finally extricated himself, he was slightly disfigured, but he had his fish.

Several parties in the lower camp brought their cameras with them, and dozens of pictures were taken of the scenery along Capon, which in later years will serve to take us back to the scenes of our younger days when we fished and camped together. Our camp is greatly indebted to the Messrs. Patterson for several photographs of our camp.

Time was now drawing near to leave, and we all hated to think about it, for we were having a good time, fishing a little, resting a little, and recuperating, after a long season of work in the city. The last day in camp everybody fished hard in order to have a bunch of fish to take home, and strict attention was paid to rings at the telephone that day, which helped us out considerably in increasing the size of our strings.

Dad arrived about 6 o'clock Thursday night, and after looking after the team, we sat down to supper for the last time on Capon, for the time being, at least. We pulled into our cots that night with heavy sighs, but were

ification of fishermen. I specify it as Mr. Fowler's classification for the sake of identification. It is, however, merely a repetition, in a way, of what has been oftentimes the *ipse dixit* of other fly-fishermen.

I have fished with both fly and bait. In my experience, the art of fly-casting, as duly enjoyed by the guild, consists essentially of two factors. The lesser factor is to fish with more or less success with the fly. The greater factor is to swell, strut, and vaingloriously boast of the fly-fisher's superiority over every other class of fisherman on earth, the bait-fisherman in particular.

Read this modest self-appreciation gravely set forth by the skillful authority, as follows: "The gentlemen who have reached this high estate (fly-fishing) can climb no higher in piscatorial altitudes; they can breathe no more rarified atmosphere; they stand on the summit, and look down with pity on their brethren who are groping below."

I think it real nice of Mr. Fowler to acknowledge so kindly and humanely that those so far below his rarified piscatorial altitude are "brethren." The "brethren" have a source of never-failing enjoyment in casting their eyes upward, and reverently gazing on the "gentlemen" far skyward on the summit of Mr. Fowler's personal idea.

The gentle Izaak Walton, on whom Mr. Fowler, from his nebulous heights, bestows profound honor by a mere mention, was a bait-fisherman, and perchance something of a "plain plugger," if one may do him further honor by fitting him to the Fowler classification. Therefore he had no just right on earth to take wings into the piscatorial altitudes, and I now move you, Mr. Editor, that the name of that fishy deceiver, Izaak Walton, be crossed from the Hall of Fame, and that hereafter he be known as Ike the Plugger. A benighted world has mistakenly revered him through many generations for his heartfelt words, which he so quaintly bestowed on the gentle art, uttered for the good of all his fellows, and not for the purpose of self-glorification, a trait from which he was commendably and pleasingly free. Nor did his acts imply that by debasing the sport of his fellows he exalted his own.

Now, I have seen some fly-fishermen who were "pluggers." I have seen some who were not gentlemen. I have seen some whose fly-fishing was limited by the restrictions of the fantastically artistic—pretty rods, flies, lines, and glitter. I have seen others whose art consisted in beautiful loquacity. I have seen others whose ethics

and skill in the parlor were in the "higher piscatorial altitudes," while on the stream they had as much knowledge and skill as a mud dweller. In all cases I have observed that the beginner is always the noisiest and wisest, seeking the lime-light by words and clamor rather than by deeds.

I would have Mr. Fowler know that bait-casting requires more skill in manipulation than fly-casting. The fly-caster uses his tackle as a whip; the bait-caster has to guide his bait and manipulate his reel delicately at the same time to prevent back lashing. That is much the more difficult. He also has the same problems to solve with unresponsive fish.

The fly-caster knows nothing whatever as to what fly his fish will take, or whether they will take it at all. A "fly-fisherman" is a misnomer. In most instances he should better be designated as an owner of tackle in high-keyed color schemes festooned with some fishing ideas.

In any event, the excellence of a class which depends on self-eulogy cannot be considered as firmly secured. It would be much better if the world at large bestowed the eulogy and the recognition.

FRANCIS L. GREEN.

Fish and Fishing.

Late Ouananiche Fishing.

It is surprising how little advantage has been taken of the extension of the ouananiche fishing season from the 15th of September to the 1st of October. Hitherto anglers have complained that the open season closed too early, and just as the best of the sport was being afforded by the fish. It required considerable urging before the federal authorities consented to extend the open season, and now that the change has been made, scarcely anybody takes advantage of it. To such an extent is this the case that the hotel people stopped running the boat across Lake St. John and closed up the Island House several days before the end of the season. Unfortunately they had scarcely done so when a number of American anglers appeared on the scene at Roberval, only to find that there were no means of reaching the fishing grounds.

Many complaints are being made of the licenses for netting in Lake St. John, which are being issued by the Government of Quebec. It is true that these licenses are only to authorize fishermen to take coarse fish for commercial purposes, but nobody believes that the ouananiche found in the nets are returned to the water, and it is surmised that not a few of these gamy fish thus find their way to market. Up to 1897, when the netting in the lake was controlled by the Dominion Government, no licenses were issued. The recent granting of them has caused much adverse comment, not only among anglers, but even from some of the Government's own officers. Thus Mr. Beliveau, the Inspector of Fisheries for the Province of Quebec, says in his last report: "In Lake St. John, the general yield of fish is about the same as that of the previous year, with the exception of the famous ouananiche, which shows a slight diminution. Of recent years the provincial authorities have issued a few gill net licenses in this inland sea. Last year the activity of these fishermen was stimulated by a couple of fish traders who shipped to foreign markets. I have been informed that during the spring months over 500 pounds of fish were shipped weekly from one station alone. I do not believe in netting permits being granted at all in this beautiful lake, but at least they should be confined to settlers for their domestic consumption only. Although it is illegal to capture ouananiche with nets, it is probable that not a few of these fish are thus taken and easily disposed of."

The Sportsmen's Fish and Game Association of the Province of Quebec is taking this matter up very seriously, and will endeavor to bring about a cancellation of the existing licenses. Backed up by the inspector's opinion and by the fact that large sums of money are being spent in order to stock the lake and its tributary waters, the Association certainly ought to succeed.

The Missisquoi Bay Affair.

Nothing has yet been accomplished in the matter of the shameful netting of pike-perch in Missisquoi Bay, and there is, so far, every reason to believe that the nefarious practice will be pursued next spring as usual. The recently published report of the Marine and Fisheries Department of the Dominion of Canada, shows what the result of the netting was last year. Outside of about one thousand barrels of fresh fish—pickerel or wall-eyed pike predominating—and some \$5,000 worth of whitefish, captured by the American fishermen licensed by the State of Vermont, the Canadian catch included some 30,000 pounds of pickerel, 4,000 of pike, 25,000 of perch, and 18,000 of mixed and coarse fish. This means that in round figures there were taken in nets out of Missisquoi Bay during the year over a quarter of a million pounds of fish. It may well be asked how long these beautiful waters are to stand such a drain upon their resources. The question of an international regulation prohibiting all kinds of netting in these contiguous waters has been continually on the tapis. Missisquoi Bay is now the only sheet of water in the whole eastern townships of Canada in which the use of seines is tolerated. The State of New York has already prohibited any kind of netting on its side of the lake. The State of Vermont has given its commissioner the power to refuse or to issue netting licenses according to the action that is taken by the Canadian authorities. Last season the provincial authorities granted fourteen licenses, mostly to well-to-do farmers with a political pull. Their seines, which they set under the ice, are from 80 to 110 fathoms long, and require three men each to handle them with the aid of cranks. The chief contention of these fishermen is that if they did not catch these fish as they approach their spawning beds, they would never catch any at all, as the pickerel return to the deep water of the lake as soon as their spawning season is over. It is understood that some thirty-five seine licenses were issued by the Vermont commissioner last spring at \$20 each. Their chief fishing ground, in the vicinity of Alburg and Hog Island, should be a profitable one, as the fish are caught there, in their descent from, as well as in their ascent to, the spawning ground. In the autumn season, between sixty and seventy seining permits are also issued by the

State of Vermont. This makes a total of about a hundred Vermont licenses, which would be no longer issued if only the Canadian authorities would withhold the fourteen or thereabouts that are granted by them. Therefore, under the proposed system of mutual protection, the State of Vermont would sacrifice much more than the Canadians would. Yet the Canadian Government seems blind to the fact, notwithstanding that it is plainly urged by their own officials.

Good Fall Fishing.

Many of the fishermen returning from the Lake St. John country, report some excellent catches, though, as usual, the same good fortune has not attended everybody. Some very good three to four-pound trout have recently been taken out of the waters of the Nonantum Fish and Game Club, and even larger fish have rewarded the efforts of those who were fortunate enough to fish in the Jeanotte River during the latter part of September. From the Wayagamack Lakes, which are fished by the members of the Laurentian Club, come also interesting stories of the sport had by anglers. In the Lake Edward and neighboring waters the numbers of anglers this fall has been so large that at one time no less than 85 guides were out at the same time with them. Yet the extent of these waters is such that the different parties rarely met.

An English Angler in Maine.

English anglers and English writers on angling seem to be at present directing their attention to the fishing waters of Maine. Lieut.-Colonel Andrew Haggard, the author of "Sporting Yarns" and of the introduction to "The Ouananiche and Its Canadian Environment," and a frequent contributor to the London Field, has been for some time past in search of sport and of material for sporting articles for British publications, in the woods and on the inland waters of Maine. Some of the letters

IN THE DAYS OF OLD.
From the Woodcraft Magazine.

recently received from him tell of capital sport in the Pine Tree State, some of which he participated in, while of other he was an eye witness. He writes of two landlocked salmon (so-called) which he saw killed upon two successive days in the Moose River, one of which weighed 9 pounds and the other 7½. Then, there is a story of a third one, but with a different ending. Its weight was not ascertained, for it has not yet been got upon the scales. But it gave the Colonel lots of sport. It was not so big, he says, as either of the other two mentioned above, but a splendid fish, and behaved just like a sea salmon. It made a run of a good fifty yards down the stream before breaking water, when it came out with a splendid leap, and then turned and ran right at the angler. Of course it was difficult to keep the canoe away from him under such circumstances, and as so often happens, it appeared as if the guide paddled toward the fish instead of away from it, with the inevitable consequence that he placed the canoe directly over the fish. The difficulty of combating rapids, or even currents, has naturally to be allowed for, but the Colonel's guide seems to have been exceptionally unfortunate or exceedingly stupid, for, as he writes me, the Colonel found himself playing his fish upon one side of the canoe while it was fighting hard upon the other.

Colonel Haggard certainly seems to have been extremely lucky in the fish which he has killed in Maine, though his luck is usually well deserved, for he is one of the very best anglers that it has been my good fortune to fish with. On one day he killed two trout with a fly in Pierce Pond, weighing 4¼ pounds each, and a salmon of 5 pounds. He killed another salmon on the fly in the Belgrade lakes, and a beautiful trout of 5¾ pounds, measuring 23 inches long and 14¾ in circumference.

At Pierce Pond the Colonel found a fish which has been forwarded to Washington for the purpose of identification by the Curator of the Museum. Through Colonel Boothby, of Portland, Colonel Haggard sent the fish to Commissioner Carleton, of Maine, who expresses his opinion that it is a "quinnat" salmon.

Variation in Size of Fish.

It is not without interest to the angler to note the amazing difference in size in fishes of the same variety

inhabiting different waters of the same description and answering the same conditions. It may reasonably be asked why a large river like the Miramichi should almost invariably produce salmon of small size and weight. The Grand Cascapedia, a river of only probably about one-third the length and productive capacity of the Miramichi, yields fish of large size running from thirty to nearly fifty-five pounds. It is recorded that the catch of a well-known United States angler during a short visit to the Cascapedia in August, 1897, amounted to thirteen fish, the largest of which weighed 41, 42 and 43 pounds respectively. The average weight of his fish exceeded thirty pounds, while from ten to eighteen pounds would be a good average for the salmon of the Miramichi. A specimen of the same fish has been taken in the Scottish Tay weighing eighty-three pounds, while Irish rivers have yielded fish of sixty pounds, and some of the rivers of Norway, salmon almost as large.

As long ago as 1863, Mr. Francis Francis pointed out that in some rivers the race of salmon and trout are naturally small and without apparent reason. He says: "In Scotland, for example, there will be four rivers running into the same estuary, and the breed, shape, make, and size of the fish of every river will be distinct and different. In some the fish will be long and thin in shape; in others, short and thick. In some they will scarce ever exceed twelve or fourteen pounds in weight, and in others they will run up to twenty, thirty, and even forty pounds, if allowed to exist for a reasonable time. Now here it is evident that the rivers themselves can have little or nothing to do with the growth of the fish, since the great feeding ground wherein the fish grow and increase their weight at a rate out of all proportion to that of any other created creature, are identical, being the broad sea; since salmon never increase their weight in the fresh water after their first trip to the sea, but rather fall off and deteriorate. Why is it, then, that enjoying these feeding grounds in common, some thrive so much better and faster than others? It cannot be doubted that it is the nature of some breeds to increase more and faster than others, even as a Hereford or Norfolk steer exceeds a Welsh or Highland stot, feed him and breed him how, where, and when you will."

Professor Prince, the Dominion of Canada Fishery Commissioner, and a prominent authority in the world of science, attributes to heredity, as the main factor, the differences which distinguish the runs of salmon in different rivers, though he also makes due allowance for other conditions such as food, physical environment or physical surroundings, age, congenital variation or inherent strength or weakness, adaptability, and security from pernicious influences. But neither in food nor in environment can be found the cause for the production of such exceptionally large fish as those which are produced in the comparatively small Scotch and Norwegian rivers already referred to, or even in the Cascapedia.

In support of his plea for heredity as the most important of all the causes of corporeal magnitude, Professor Prince points out that dwarfed parents produce dwarfed progeny, while the young of large creatures are themselves almost invariably large. Like begets like, especially in regard to bodily size. When a farmer desires to raise large sized cattle he will select appropriate parents, and will thus secure, with almost absolute certainty, progeny surpassing in dimensions the average size of the stock on his farm. He does not expect animals like large Durham or Hereford cattle if the parents are of the diminutive Kerry or Scottish Highland breed. The Professor shows that it is the same with fishes, and that trout which inhabit small mountain brooks and rills are almost invariably diminutive. The parents are small, and the resulting progeny are small, too. There can be no doubt that food and external conditions, as Professor Prince himself admits, have much to do with the difference; but, to quote his own words, "heredity is one of the most potent factors, and a brood of large trout cannot be obtained if small burn trout are selected as parents. Nor will the large river trout produce diminutive mountain trout."

It has been well said that most people attribute the size of an unusually large specimen of any fish either to its favorable environment, its food, or its mature age. A large fish, in their view, must be an old fish. This is by no means the case, however. By the crossing of breeds of almost the same variety of animals we have discovered how we can get those which best carry flesh, and which grow the fastest upon a small amount of food. Why should it not be just as easy to discover the same thing with regard to fish and then to transplant and cross the salmon of different breeds or rivers, and different families of other fish as well, until we find those which are most valuable and most suitable to our various waters? It is certainly not too much to claim that this is a branch of the science of fishculture, of which but little is known, and in which there is abundant room for patient investigation and elaborate experiment.

The Effect of Food Supply upon the Growth of Fishes.

In the matter of food supply and its effect upon the growth of fishes, experiments have not been lacking. Various writers have repeated the story of the trout placed in three separate tanks and fed, respectively, with worms, minnows, and water flies, and how those fed with worms grew slowly and had a lean appearance; those nourished on minnows grew larger, while such as were fattened upon flies only attained in a short time prodigious dimensions, weighing twice as much as both the others together, although the quantity of food swallowed was in nowise so great.

It has, too, been fully ascertained that while the quality and size of fish improve under the influence of plentiful and nutritious food, they will degenerate, even in rivers and lakes of large size, if food be lacking.

The English trout, *Salmo fario*, which is considered to have attained a very good size in England when it reaches a weight of two or three pounds, accumulates bulk so rapidly when transplanted into New Zealand waters, where it finds an unlimited food supply of the most favorable kind, that it has been caught there up to 25 and even 28 pounds in weight.

So, also, Herr Jaffe, the German fishculturist, reports exceptionally rapid growth of specimens of the rainbow trout when transplanted into German waters and fed chiefly upon mollusks and small fish.

E. T. D. CHAMBERS.

Seeing Tarpon.

MR. J. C. HOPKINS, of New York, has just returned from Aransas Pass, Texas, the most enthusiastic tarpon fisherman seen this season. "I went out about 12:30 o'clock," said Mr. Hopkins. "My guide baited my hook, and then I waited—just waited until that tide turned and came up through the pass like a race horse, and with it came the tarpon." At this point I asked Mr. Hopkins to write his experience for *FOREST AND STREAM*. "Write it," said he, "Write it? Nobody could write it and have it believed. Why, say, they not only came in doubles, but in droves, just leaping bunches of them—hundreds of them; in fact, one of them just missed coming in our boat, while another one grabbed my hook, but in the excitement I forgot to strike. The next one I struck in the bony part of his jaw, and broke loose; then I got busy

and hooked one just right. That one went to the beach with us and measured 5 feet 10 inches. I am having it mounted, and it will adorn this street very shortly."

T. E. B.

The National Beagle Club of America.

CAMDEN, N. J., Sept. 28.—The Fifteenth Annual Field Trials of the National Beagle Club of America will be held at Mineola, Long Island, during the week commencing October 31, 1904.

The headquarters of the club during the trials will be at Johrens' Hotel, Mineola, L. I., the hotel rates being \$2 per day.

During the trials good stable accommodations and feed

for the beagles entered in the trials will be furnished free by the club.

It is the desire of the club that all beagles entered in the trials should arrive at Mineola not later than Saturday evening, October 29, in order that the necessary preparations may be made for an early start on Monday morning.

The club would deem it a favor if those intending to make entries would notify the secretary as soon as possible of their intention to attend the trials, and what number of beagles they will enter, so that the committee can arrange hotel accommodations for them and accommodations for their dogs.

The club has arrangements for free transportation from the club's headquarters to the field trial grounds for members of the club and those making entries.

CHARLES R. STEVENSON, Secretary.

YACHTING

Cruise of the Neptune.

BY WILLIAM H. AVIS.

Hot don't express it! Despite the fact that it was 9 A. M., the mercury stood at 90 in the shade. Perhaps my language was not any cooler than the weather! I had been stationed at the intersection of four streets for an hour and a half, vainly looking for an ice man. Major had made three or four trips to the Neptune in that time, and Sam had hoisted the mainsail and snugged the yacht's stem close up to her mooring buoy. Finally I took to chasing all kinds of wagons, in all directions, only to have them turn out to be laundry teams, butchers' carts, and even an undertaker's conveyance—which was not the kind of ice wagon I was looking for. But in the course of events the right variety of ice man finally materialized.

"Will you just drop down to the City Point Yacht Club house, and deliver 300 pounds of ice?"

"No, sir. Can't do it. It's off my route. The feller that goes down that way'll be along soon, 'n' 'll sell you the hull wagon load, if you want it."

I was mad, discouraged, and disgusted. We *must* get that ice aboard inside of another hour or the yacht would be aground. Just then a dilapidated Israelite, driving what was once a horse, which drew a wreck of a wagon, attracted my attention. A happy thought struck me. I saluted the honest dealer in cast-offs: "Hi, there, Isaac!" (that was his front name), "Would you like to earn a quarter?" He would, and as the ice man was perfectly willing to sell, if not to deliver, the venerable merchant and I were soon on our way to the club house with a cargo of provision preserver.

Neptune is 28ft. over all, and but little less on the waterline. Her beam is 14ft., and she draws 4ft. without her board. Her cabin is very roomy, with good headroom; yet her house is not out of proportion in height above the deck for a craft of her class. There are three comfortable berths, plenty of lockers, and an abundance of comfortable bedding. A small cook-stove was used for cooking purposes. And right here I wish to say that no oil-stove ever invented is the equal of an ordinary, every-day cook-stove. In her inventory the yacht contained everything necessary for cruising. The cockpit is the largest and roomiest I ever saw on a boat of Neptune's class. It contains the ice-box, which has a capacity of 500 pounds. While the boat is full sloop rigged, we used only the mainsail and jib on our three days' cruise. Halliards and sheets all lead to the cockpit, and, with the exception of reefing, the handling of sails while under way is all done from that point. Originally Neptune was built for a Noank lobster boat.

Judged from a point of beauty, Neptune is a failure. Symmetrically she is about as handsome as a bowl of mush; but for comfort, seaworthiness, and motherliness—ah! that's another story. Off the wind she can sail a good, stiff clip; and she did very well on the wind when the sea was smooth. But in a steady pound to windward in a nasty tumble, she is about as fast as a hearse. My! how she can rear, thresh, pound, and stand still under such conditions! But she is staunch and able as a light-ship, and safe as a boat can very well be.

At the time of our little cruise, Neptune belonged to Captain Geo. E. Albee, of the Regular Army, retired, and Mr. Clarence Eaton—better known as Cap Eaton. She was then enrolled in the City Point Y. C., of New Haven. Since our cruise she has been sold. Samuel Chard and I were the fortunate guests of the genial captain, whose title of Major, which will be used in this article, was gained through services in the Connecticut militia. So much for introductions.

The ice and provisions properly stored, the tender was made fast astern, mooring dropped, and the jib run up. The southwest wind necessitated a beat out of the harbor, so the yacht was headed for Morris Cove, on the starboard tack. Before reaching the cove, the wind died to a zephyr; but the tide was with us, though our progress was slow. We drifted by the bark St. Mary's, which was said to be loaded with powder. Then a sharp-visaged lady, of uncertain summers, aboard of a vessel attracted our attention. She was industriously retrieving among the frowzy curls of a red-headed girl with a fine-toothed comb.

Once by the Sperry Light, which marks the eastern end of one of the new breakwaters, we found a little more wind. Then Major decided it was about time to feed Sam and I, not to mention himself. Before starting, he had impressed it upon our minds that we were to do the work—that he wouldn't work. Before we got home he did most of the work himself, and unconsciously proved that he was not a lazy man at all. A portion of the contents of a bottle of "Hunter's," reinforced with the proper proportion of lemon, sugar, and not too much

water, added fuel to appetites already ravenous. Then Major prepared a most substantial dinner of fried steak, hardtack, and hot coffee.

After dinner—yes, while the meal was under way—there was very decided evidence of a breeze of wind in the southeast. Far down in that quarter yachts could be seen shortening sail, and the darkening hue of the sea in that direction prophesied more propelling power than we would need. It was advancing rapidly in our direction, so we tied in a reef as a precautionary measure. For a while we enjoyed a bit of snappy sailing, with just a trifle of sheet lifted. Then the wind gradually headed us, and it became a vicious pound to windward. Off the mouth of the Housatonic River we began to meet the full force of the outrunning tide, and when we made Stratford Point, it was like butting into a stone wall. This butting into wind, sea and tide, mingled with a determination to learn to smoke, which I have persistently stuck to for the past twenty-five years, compelled me to lower my colors to an uncompromising Neptune. So I reluctantly gave up my dinner.

Finally it became a hopeless game of thump, tumble and smash against an increasing tide and a diminishing wind. Long Beach was a proposition we could not overcome. Eventually, however, we began to leave it, but in the opposite direction to the one we wished. But, personally, I was feeling fine. I had paid the penalty for the full enjoyment of the good things of the sea, and was determined to get my fill. The art of learning to smoke was deferred to the future, on terra firma. The salt-seasoned oxygen was superb in quality and unlimited in quantity, and free for the taking. The sun shone with a lustre that was never surpassed. The waves flashed and sparkled like diamonds strewn over a world of fire. Distance touched the dingiest of sails with the soft tint of pearls, and graceful yachts drifted silently over the sea like zephyr-blown thistledown. Great banks of cotton-like clouds lifted out of the west, and over land and sea stretched the wings of freedom and rest.

Our intention had been to reach either Oyster Bay or Greenwich that day; but under the conditions we decided that Black Rock Harbor would be good enough for us. Late in the afternoon, when we had lost fully three miles in drifting, the tide turned in our favor and we got a nice breeze. At the same time those "cotton-like clouds" in the west began to demonstrate that they were designed for something else beside beauty. As they amalgamated into one dark mass, charged with electricity, they served indisputable evidence that it was not to be Black Rock Harbor for us that day. And for a while it was even doubtful if we would be able to reach Bridgeport before the squall. The race was a close one, and caused the sporting blood to tingle with excitement in our brush with the elements, but we were the victors by a neck! The anchor was hardly down and sails furled when the storm broke.

If one has a clear conscience, or no conscience at all, then he can thoroughly enjoy a thunderstorm. I don't know which class I'm in, but, really, I like 'em! In duration this storm was but a small matter; but it needed no reinforcement in strength. The hail and rain roared down like an express train; the lightning snapped and flashed like monster rapid-fire guns, and the thunder cracked and boomed in deafening crashes. The wind blew so hard that a small excursion steamer coming into the harbor could make no headway against it whatever for fully five minutes, and we thought she would surely go ashore. In twenty minutes, however, the storm had begun and ended; the setting sun was flashing over a newly bathed world resplendent in sparkling purity; and a great double rainbow arched the Sound from north to south in the east, and its mysterious glory faded only with the sinking of the sun and the silent advance of night.

After supper we dropped a couple of lines into the water for eels, while we talked in the cockpit. We got no eels, but there in the rays of our riding lights, surrounded by anchored vessels which looked phantom-like in the darkness, Major told us many interesting stories connected with war and the hunting trail. It was a great treat to listen to him, for his experience has been wide. Enlisting as a private in the 36th Wisconsin, in the Civil War, he followed the vocation of a soldier up to the time of his retirement from the Regular Army, a few years ago, when he was retired as brevet captain. He is the proud possessor of a medal struck by Congress for him for conspicuous gallantry in action against the Indians; and he has a valuable collection of Indian and other war relics, which it is worth while going a long way to see. A friend of Miles, Lawton, Shafter, Buffalo Bill, and many other soldiers and men whose names are connected with our nation, and especially the West, Major Albee cannot be otherwise than an interesting person to be privileged to listen to. Add to all this his

excellent qualities of hospitality as a host, and you have a combination hard to beat. Beside being a soldier, the Major is an expert shot. In 1882 he won the "Rapidity" matches for the Lorillard gold medal at Creedmore, using at the time a Hotchkiss rifle. He has also killed much large game in his time. At the present time he is connected with the Winchester Repeating Arms Company.

We were away bright and early next morning, in order to take all advantage possible of the tide. Going out of the harbor it was against us; but there was a nice breeze, with promise of more. The morning was bright and clear, and not a cloud in the sky. Once clear of the harbor, the S.-S.W. wind allowed us to head a course for Eaton's Neck Light, with sheets well in. Every indication pointed to a pleasant run at first, but as the morning advanced, the wind hauled more and more into the west, and died in strength as well. When off the Norwalk Islands, however, the wind freshened so suddenly and rapidly that we tied in a reef. Before coming up with Green's Ledge Light there was a grand lump of a sea running. The sky became overcast with swiftly scudding, fluffy clouds, and the wind came diagonally off the land in hard, spiteful puffs. One moment we would be sailing along bolt upright, to be flattened down almost rail under the next minute. But despite the fierceness and suddenness of the squalls, Neptune's ample draft and excessive beam held her lee rail above the surface. After a hard and stubborn reach right into the wind's eye, we finally anchored under the lee of Shippan Point, in Prescott's Cove, for dinner.

Before proceeding on our way, we tied another reef in the mainsail, and reefed the jib. Our delay of nearly two hours had cost us the last of the flood tide, and as the wind had steadily increased in strength, we fully realized that we were in for a good dusting before we could reach our destination—Greenwich. As we cleared Shippan Point, all hands made haste to don storm coats and oilers. The sea was one confused jumble of hard, white-crested lumps, and the way in which they jolted Neptune and caused that motherly craft to rear, plunge, and stand still, was a caution. Wind, sea and tide being against us, we were in an almost constant smother of flying spume. To beat to Stamford Light under the existing conditions seemed a hopeless proposition; so Sam, who always does the right thing in the right time aboard a boat, clawed his way out on the bowsprit and shook the reef out of the jib. We made better headway, and there is not a shadow of a doubt that we would have done better still had we shook out both reefs in the mainsail. The yacht was so short and heavy for her beam that under the conditions that existed she hadn't propelling power enough to drive her through it. She was so able that, under Sam's skillful handling, she could easily have carried full mainsail and jib and made better weather of it. But we were in no hurry, and were enjoying the fight immensely.

Greenwich Point proved a most difficult proposition. We did not average 100 yards' gain to the tack, and it seemed that we never would open up the harbor sufficiently to weather the red spar buoy at its entrance. But the job was finally done, and under the squally puffs we enjoyed an exhilarating tussle to windward in the smooth water of the harbor to the anchorage off the Greenwich Y. C. house.

After things had been made shipshape, and while Major was doing his favorite stunt of preparing supper—as Major only can—I snapped a few shots with the camera. While supper was under way, Mr. Stanley Chard, Sam's brother, who is also my brother-in-law, came aboard. Then after the dishes were washed, we visited friends and acquaintances afloat and ashore. We returned aboard early, however, and were lulled into sweet dreams by the strains of an orchestra, which was dispensing mellow music at a hop in the club house. We had worked hard, were thoroughly tired, and our comfortable berths furnished welcome relief.

Next morning found the sun streaming through the cabin windows in a flood of light. A soft westerly wind ruffled the surface of the Sound, and there was promise of an ideal day ahead. And, hard to relate, this was to be our last day, as our time would expire with its ending.

We ate breakfast in the cockpit, and watched the crews of the fleet of handsome yachts as they washed down decks, aired sails, etc. And right here, in Greenwich Harbor, is where abundant opportunity exists for a lover of yachts to feast his eyes on the best productions that exist in that line. In the yachting season there is always a big fleet here, sail and steam, and from the smallest to the largest. A 50ft. power launch, with a speed of nearly 20 knots an hour, shot by while we were eating, leaving a wake like an ocean liner. She was bound for New York with her owner, who is a business man of that city. This yacht carried its owner to and from business every busi-

ness day—quite an ideal way of going to and from work, in my estimation.

Just for a view of Belle Haven, with its handsome residences, and of the beautiful islands which lie off that place and Portchester, we sailed four or five miles off our course. This necessitated a close reach out of the harbor by the west channel, against the tide. When we finally cleared the western end of Great Captain's Island, we were able to lift sheet and run off on our course—dead to leeward. Major was in his glory. This was what he had been looking for from the start. As we were homeward bound it was, perhaps, a welcome change for us all. But for sport and excitement, I, personally, prefer a spirited dash to windward. I think, however, that most yachtsmen will agree that reaching is the most pleasant point of sailing. Running dead away from the wind, with the mercury at 90 in the shade, is a miserably hot game. But in reaching, or working out to windward, one can keep cool and get the full benefit of the wind; also an occasional taste of brine.

The breeze gradually freshened, and we were not over two hours in making the distance it had taken us eight hours to make the day before. Cokenoe Island was off our port bow by 10 o'clock. Between here and Penfield Reef Light, I snapped a handsome, three-masted schooner. There is something in the sight of a merchant vessel under full sail which, somehow, appeals to my fancy. They look different from a yacht, and, in fact, they are different. The comparison, perhaps, is like that of a frail, effeminate dude and a rugged, robust man. The merchantman looks sturdy, and fit to fight the elements to a finish in their fiercest mood. The yacht looks frail and timid, and ready to turn tail and run on the slightest provocation.

We were off Bridgeport by noon, and from here to Stratford Light the wind was very light. After passing Stratford Point, we had our last meal aboard—a good one, too. Off the Housatonic River the wind was very fickle, and caused the boom to gybe time and again, and it was hot as an oven. But a squall began to pile up in the west and work slowly in our direction. As the clouds covered the sun, the wind hauled off the land, N. of W. This was a welcome change, as we were nearly baked. The clouds were well over us when the water under the shore darkened like ink, and yachts in that quarter could be seen dousing their sails. The wind was reaching out toward us with a vengeance; but when we got it our mainsail was down, and we scudded along very comfortably under jib alone. This harmless little contretemps of the weather lasted about ten minutes. When it ended, we were inside Southwest Ledge Light bucking the tide with no wind. Finally Mr. Charles Stephens, who was knocking around the harbor in his power launch, spotted us. He very kindly took our line, and in fifteen minutes we were anchored off the City Point Y. C. house, and our delightful little cruise was ended. Neptune had covered about 50 miles in less than eight hours. But—whew! wasn't it hot ashore?

Roughing it in Newfoundland.

In the summer of '98, in company with a life-long friend of mine it was my good fortune to spend some few days in cruising and exploring one of the great northern bays of Newfoundland. I at that time owned a small yacht, in which I had sailed on many a trip such as I am describing. Twenty-three feet long by the keel, 8½ ft. wide, and drawing 6 ft. of water, we had as fine a sea boat and as good a sailer as one would wish; and both are needed in these waters, for the wind blows strongly against the current at times, and a nasty sea is the result. A small cabin in which to sleep, and a foc'sle with a "bogey" in it for cooking purposes, provided comfortable accommodation in any weather.

Leaving the south side of Trinity Bay with a fair, smart breeze, we had every hope of running across, a distance of about 16 miles, in a few hours, when to our annoyance the wind suddenly failed. We rowed the remaining distance, and about 4 o'clock one summer afternoon, in a thick fog which had come down, two weary voyageurs made out the land on the north side of the bay. Where we were we had not the faintest idea, owing to the fog, but trusting to Providence and keeping a good lookout for rocks, we ran in, under the influence of a slight breeze, and anchored inside the point of a small harbor. The scenery in this part of the island is of the most beautiful description. High precipitous cliffs run up from the water's edge in places hundreds of feet, the home of many sea birds, such as gulls and sea pigeons. At frequent intervals the shores are indented with small harbors clothed with forests of fir, spruce, and pine running down to the water's edge, and clinging to the sides of the cliffs in most fantastic shapes.

We had anchored close inshore, for the water is deep, and the fog lifting, saw some houses on the other side of the harbor which gave us a clue to our position, for there are few inhabited harbors on this particular part of the coast. Close by us we made out two boats seining caplin, a small fish about eight inches long and of delicate flavor, which abound in these waters at this time of the year, and are used extensively for bait and fertilizing purposes. While I attended to making the boat snug and shipshape for the night, my friend tackled the commissariat question. In exchange for a stick of tobacco—a never-failing medium of barter—he received a supply of fish fresh from the net, which he cooked, and on which we supped with sharpened appetites. We turned in, after a pipe, trusting to secure a night's repose untroubled by any wordly cares. But alas! Fate that day and night certainly seemed against us. In the ardor of youth, and the desire to flee from the restraining influences of civilization, we had decided to discard all such useless encumbrances as beds, contending that boughs with blankets over them would be quite sufficient. We had nailed laths on a frame over the floor of our bunks, intending to cut the boughs when we reached our first anchoring place; but we had not reckoned on the fog and wet, and this of course effectually prevented our bed-making for the night. We made the best of the circumstances with a tarpaulin, but my advice is, don't try to sleep on a lath platform; we certainly longed for the day.

However, it was the last of our troubles. The morning broke calm and bright, and after a good wash on

shore in a running brook enlivened by some very interested mosquitoes, which are a plague all over the island, we hauled up our anchor, and, with a fresh breeze, sailed up a long arm of the sea called South Sound, and again anchored for the night. The next day we reached our furthest point, called the "Box," a stretch of shoal water joining two arms of the sea. Here we spent two or three days fishing for sea trout and exploring the surrounding country. The days here were simply delightful, and the evenings perfect. Calm water—for the Atlantic swell never reaches this—makes it an ideal place for yachting. The trees ran down to the water's edge, and their reflection could be clearly seen; the stillness at times was almost oppressive. There is very little shooting, however, here; a few geese in spring or autumn, which are very difficult to approach, and an occasional sea bird and shore bird, varied by the sight of a bald-headed eagle, are the only feathered inhabitants worth mentioning.

At last one morning we very reluctantly beat the yacht back to the open sea, and finding ourselves becalmed by an island we went ashore to explore. Here we spent the greater part of the day, with the slight incident of a chase in the Rodney after the yacht, which had dragged the small anchor over a ledge and was drifting seaward. On the island were a colony of stormy petrels and puffins, and we spent most of the time watching the birds. The petrels were nesting, and we dug down into the turf to examine the eggs—the egg, rather, for there was only one in the nest we examined; it was at the end of a small tunnel, and the bird was setting; it seemed quite dazed when brought to the light, but after a while flew away. The egg was so fragile that, to our regret, it broke at the touch.

Leaving the island in the evening, we reached across the bay in the night to our port of embarkation, and once more returned to the city and its ways.

TERRA NOVA.

A South Sea Cruise.

THE American schooner yacht Lurline, owned by Captain H. H. Sinclair, of Los Angeles, California, has returned from a very successful cruise in the South Pacific. She arrived at San Pedro on September 12. Lurline was formerly the flagship of the San Francisco Y. C., and built for Mr. John D. Spreckels. She is 83 ft. over all, 75 ft. waterline, 20 ft. breadth and 10 ft. draft. She has a cabin trunk and carries on deck a round bottom boat and a dory for surf work.

Mr. Sinclair, accompanied by his wife and daughter and Mr. Lew Freeman, left San Pedro, Cal., on the 4th of February, bound for a six months' cruise in the Pacific. The first stop was made at Hilo, Hawii, 18 days after

SCHOONER LURLINE LEAVING HONOLULU.

leaving their home port. They remained in Hilo a week, visiting the great burning mountain, the volcano of Kilauea, and the sugar mills, etc. They also were dined in the ancient Hawaiian custom, where the edibles—fish, fowl, vegetables—were all cooked in the ground by the heat of red-hot stones. These feasts—"luas," as they are called—are served on ferns spread on the floor, and the guests and hosts have to sit on the floor.

The yacht arrived at Honolulu March 3, and the party were at once taken care of by the Hawaii Y. C. and their friends. They visited the famous Pearl Harbor, cruising about this beautiful lagoon in La Paloma. After a pleasant stay of three weeks they departed March 24 for the long southern cruise among islands made interesting by Stevenson.

She made an excellent run to the Marquesas, arriving at Nuka Hiva in 17 days. From there she journeyed on to Papeete, Tahiti, making the trip in 3 days 18 hours, which is said to be the best record in those far-away waters. The party remained nearly a month at this place, riding around the island and studying native life. After leaving Tahiti they sailed for Tutuila of the Samoan group, arriving at Pago Pago May 24, after a ten days' run.

Suva, Fiji, was the last place visited, and on July 2 Lurline was headed for Honolulu, where, after a pleasant voyage of twenty-eight days, she dropped her anchor in the harbor, July 29. The yachting party was again entertained by their friends. The Hawaii Y. C. gave a dinner at the Royal Hawaiian Hotel in their honor, and Mr. Sinclair was made an honorary member of the club.

On Lurline's departure from Honolulu, August 10, the local yachts Gladys and La Paloma accompanied her as far as Lahaina, Maui, 80 miles to windward. The local boats put up a \$50 cup between them to make it interesting. Steady trades had been blowing, but just before the start the weather clerk switched the circuit to the S. E., and light with very threatening weather indications. However, they all started, and experienced a very disagreeable night, owing to rain, calm, and huge sea

tumbling them about in lively fashion. At daylight next morning La Paloma and Gladys could see each other, the latter boat some eight miles ahead, near Molokai Light, having made only thirty-five miles in fifteen hours. Lurline was very unfortunate in finding all the bald places, and was some twenty-six hours reaching a point near the last named light, when he decided to put back to Honolulu and give up the Lahaina trip, owing to unfavorable weather. He would have continued on to Hilo, but he had two guests aboard for Lahaina, and wished to return them to Honolulu rather than carry them too far from home. She arrived back just as they were lighting the channel lights, having logged nearly 11 knots an hour after she got the leading wind on the down run. Gladys reached Lahaina late that afternoon, and La Paloma the next morning. The race between the local boats was off, owing to the slow trip out consuming all but 6 hours of the time limit which made it impossible to make the run home of 80 knots at a 13-knot clip. Gladys has a record of exactly ten hours for the run under favorable conditions.

Lurline left Saturday, August 13, for Hilo, and from thence to her home port, San Pedro.

Mr. Sinclair is particularly pleased with the cruise as a whole, it being his first long voyage on a yacht. He intends returning to Hawaii next year. Mr. Sinclair is his own navigator, carrying a mate and four men before the mast.

ALBERT DELMAR.

Rhode Island Letter.

PROVIDENCE, R. I., Oct. 1.—The Bristol Y. C. held its annual election of officers at its club house in Bristol last Monday evening, and besides electing Vice-Commodore Charles F. Tillinghast, owner of Little Rhody, Commodore for the ensuing year, elected Sir Thomas Lipton an honorary member of the club.

The Bristol Y. C. is now on a sound basis in many respects, especially in regard to membership, there being a total of 116 members at present. The club has a fine personnel, this being due to the careful mode of procedure followed relative to admissions. About all the members are keenly interested in yachting, and more than a few are also members of the New York and other yacht clubs, owning both steam and sailing craft. Rear-Commodore Russell Grinnell was made Vice-Commodore, and the new Rear-Commodore is Mr. William J. Aldrich, a son of Senator Nelson W. Aldrich. The other officers are the same as last year, and the complete list is as follows:

Commodore, Charles F. Tillinghast; Vice-Commodore, Russell Grinnell; Rear-Commodore, William T. Aldrich; Secretary, Frank A. Ingraham; Treasurer, Charles H. Douglas. Executive Committee—W. Fred Williams, Henry W. Hayes, Edward I. Brownell, Charles B. Rockwell, William H. Thurber, and H. H. Shepard. Regatta Committee—Edward H. Tingley, Walter H. Almy, and Wallis E. Howe. Committee on Admissions—Frank A. Ingraham, William Bradford, J. Winthrop De Wolf, Frederic Hayes, and L. S. Hoffman. House Committee—Albert S. Chesebrough, James Connery, and T. S. McKeon.

The steam yacht Little Sovereign, owned by Mr. M. C. D. Borden, of New York, was at the Herreshoff shops recently for the purpose of repainting and having a new propeller fitted.

The power yacht Coronet II., owned by ex-Commodore Joseph E. Fletcher, of the Bristol Y. C., has been sold to Mr. J. H. Nicholson, of New York, who will fit her up for a winter cruise in Florida waters. The craft, which is a very comfortable cruiser, with a large cabin, and about 60 feet in length, has been taken to New York for delivery to her new owner.

The first of a series of three special races for the 30 ft. cats of the Edgewood Y. C. was sailed last Saturday, and the second was sailed to-day, Oct. 1. The only contestants were Mblem and Elizabeth, between which the race for the club "cock of the walk" pennant has been very close through the season. At the finish of the regular season's schedule the Mblem had 45 points to her credit to 44 for Elizabeth. The latter won the first special race, sailed in a squally S.W. half-gale, thus tying the score, which gave 46 points to each boat. The defeat, by a margin of 16 m., was about the worst the fast Mblem has ever had to take, Elizabeth proving a much better sail carrier under the conditions that prevailed. The wind was even worse for the second race, coming from the N.W. in solid chunks that made hard work. Clara was entered in this race but broke her boom in gybing around the first mark and had to withdraw. Elizabeth again won by a little more than 6 m., thus putting her in the lead by one point. The last race will be sailed Saturday, Oct. 8. The summary:

	First Race—Start, 3:00—Course, 11 Miles.	Finish.	Elapsed.
Elizabeth, W. D. Wood.....	5 17 45		2 17 45
Mblem, G. E. Darling.....	5 33 50		2 33 50
	Second Race—Start, 3:12:30—Course, 7 Miles.		
Elizabeth	4 26 07		1 13 37
Mblem	4 32 24		1 19 54

F. H. YOUNG.

PASSING OF VENCEDOR.—Commodore Fred. A. Price, of the Columbia Y. C., of Chicago, has announced that his 50-footer Vencedor has probably sailed her last race, and will doubtless be dismantled at the end of the present season. It is the intention of Mr. Price to use as much as possible of the material in the construction of a new boat. The lead in the keel, sails, spars, rigging, etc., will go into what is expected to be one of the finest yachts on the Great Lakes. It is said plans for the successor to Vencedor are already under way, and that they call for an auxiliary yawl of from 75 ft. to 85 ft. over all. The new boat will be the largest of the kind on the lakes, and the hull construction will be entirely of steel. It will be built in the east during the coming winter. Commodore Price announced he was out of the racing game.

The passing of Vencedor will be much like the parting from an old and faithful friend to the yachtsmen. The yacht for several years has earned and sustained the reputation of being the crack racing craft of Lake Michigan, and has won a number of trophies for its owner and for the club under whose burgee she sailed.—Brooklyn Eagle.

Boston Letter.

THE yachting outlook in Massachusetts Bay for a coming season is much brighter than it was a year ago, and there is every reason to believe that there will be a reaction from conditions which then existed. The most popular class will still be the 18-footers. It is believed, however, that many 15-footers will be built during the coming winter and spring. There were half a dozen boats in the class during the season that has just passed and those who raced in them are satisfied with the boats. Shiverick, of Kingston, is understood to have a number of orders for 15-footers, and there will probably be others built at different places. The boats are quite large for 15ft. waterline, and the cost of construction, which is a prime consideration, is quite reasonable. The boats are as fast as they were expected to be under the rules and compare well with classes of longer waterline length.

While it is expected that a number of 18-footers will be built, it is not likely that the number will be as great as in the two previous winters. The class is very popular and has already taken root in waters outside of Massachusetts Bay. The boats are all that could be desired. They are reasonably fast and are easily handled and there is enough boat to stand considerable weather. It is believed by many of the owners of centerboard boats in the class, that the keel boats have a little the best of it, and it is said that an effort will be made to make such compensation for the centerboard boats that will put them on an equal footing with the keel boats. The majority of owners are averse to having any changes made in the rules now, and so the measure to favor the centerboards is likely to be contested. During the past season there was more than one boat on which the owner sailed very few, if any, races. This has caused a little howl to go up and a proposition to compel owners to sail on their own boats during a given number of races. Most of the owners, however, feel that if a man does not take any more interest than to be simply the owner of a boat, it is his loss, and so there is not much to be expected in the line of changes in this quarter. The rules state now that the boats must be sailed by amateurs in the races, and most of the owners are content with that.

It has been said that some new 22-footers may be looked for before the winter in over. There has certainly been good racing in the class during the past season and great interest has been manifested by the owners of the boats. It seems strange that new boats should be built for a class which has rules that do not permit of a boat remaining under 22ft. waterline for any length of time. The yachts that have been built are, with few exceptions, practically 25-footers. The object in the first place was to get as nearly the qualifications of a 25-footer as possible on a 22ft. waterline length, and the object has been attained, with the exception of the 22ft. waterline. The owners of the boats are well satisfied with them, however, and as they race under rules of their own association it makes little difference whether they call them 22-footers or any other length.

The fact that these boats are really more than 22ft. waterline, however, and that they carry the sail that would be given a normal keel 25-footer, hinders the re-establishment of a new 25ft. class, which would be likely to be very largely patronized. The yachtsmen will not accept a class that is not faster than a class of less waterline length, and a 25-footer under new rules would find it hard to get away with these boats that are called 22-footers. There was only one boat built for the 21ft. class, and it is not likely that there will be any more, as it was found that this boat was not as fast as the old raceabouts. The establishment of a good 25ft. class would be welcomed. The class of that length was very popular before the freaks got in, and it can be made so again.

At the present time there seems to be very little likelihood of any new boats being built for the new 30ft. class. There are three boats now, but as Chewink IV. had a perfect picnic with the others all through the past season, it is difficult to understand why they should want to go through the same performances another season. The yachts are not anything like what is desired by the majority of yachtsmen and, while they have shown speed, they are not likely to be popular. Even the speed question is uncertain with boats of equal length and modern design, since the visit of Chewink IV. to Bar Harbor. There Chewink IV. met Bat, one of the Bar Harbor one-design class, under the lightest and flukiest of conditions, which are considered the worst for Bat. Bat won, however, by a small margin, which would have been greater had not Chewink IV. been favored by a fluke. There has been some talk of forming a one-design class with boats of the type of the Bar Harbor class and confining the class to Marblehead, but nothing definite has been done about the matter yet. Conditions are not right for successful one-design classes in Massachusetts Bay. The interest is too general, and the minute an attempt is made to confine a class to any one place, the class becomes dead. This was shown in the raceabout class, which was really a very good class and deserved to live longer.

There is some talk of forming a class of 35-footers to race along the general circuits, and it is not impossible that this will meet with success. There are several yachts of the length which have done more or less racing during the past season, and the owners would probably welcome being put in a class by themselves. Even if no other yachts are built, it is likely that the owners would agree to race under time allowance, and the racing of the class would be good for yachting generally. The yachts already built have been intended for cruising boats and they are of good wholesome types, and they also possess a fair amount of speed. It is felt that racing among yachts of this length would gradually lead to the re-establishment of permanent racing among yachts of greater length.

JOHN B. KILLEEN.

New York Y. C.

Glen Cove, L. I. Sound—Friday, Sept. 30.

THE last race of the season for the 70-footers was sailed on Friday, Sept. 30. The race was won by Yankee, giving her the series, as she already had two races to her credit. Five races were sailed. Rainbow won two, Virginia none.

The race was sailed in a W.N.W. gale, the wind never being lighter than forty miles. The start was made off New York Y. C. Station No. 10, at Glen Cove. The first mark was off Shippan Point; thence to Parsonage Point and back to finish line, a distance of 21½ knots.

All three boats were under lower sails, and with this canvas they had more than they could carry. Faster time and better weather would have been made had all the contestants sailed with two reefs tied down.

Messrs. Eugene Lentilhon and Paul W. Stevenson managed the race in the absence of any of the regular committee. The event was admirably handled from the tug Unique by the committee, who introduced some innovations, which met with genuine approval by the racing skippers. Ten minutes after the finish a complete summary of the race was placed in the hands of the owners of the three racing boats.

Yankee was first away, followed by Rainbow and Virginia. Yankee had a good lead at the start, and she was never headed. The boats steered wildly in the heavy puffs. Yankee broke out a small jibtop sail soon after the start, but finding it useless, got it on deck. Rainbow and Virginia tried their gafftopsails, but these sails killed the boats, rather than helped them, so were dispensed with.

Virginia carried away her jib when off Rye Beach. This accident put her out of the running for good, although she was badly licked before it happened. Her mainsail was furled and she ran back to her moorings in Hempstead Harbor under head sails.

The other two boats were moving along at a 12-knot clip, and soon reached the first mark, which was turned as follows:

Yankee2 59 15 Rainbow3 03 30

On this leg Yankee gained over 3½m. on Rainbow.

It was a close reach to the second mark, 7½ miles off. The breeze hauled and freshened a little, and the two boats were sailing at a terrific angle of heel. The times at the second mark were:

Yankee3 38 00 Rainbow3 44 30

To the finish line it was a broad reach. Rainbow made a substantial gain on this leg and cut down Yankee's lead considerably. Yankee won by 4m. 36s. The summary:

	Start.	Finish.	Elapsed.
Yankee, J. Rogers Maxwell.....	2 07 45	3 59 19	1 51 34
Rainbow, Cornelius Vanderbilt.....	2 08 28	4 04 38	1 56 10
Virginia, W. K. Vanderbilt, Jr.....	2 08 33	Disabled.	

Niagara IV.—Tarantula Match Race.

Long Island Sound—Wednesday, Sept. 28.

THE twin screw steam yacht Niagara IV., owned by Mr. Howard Gould, and the turbine steam yacht Tarantula, owned by Mr. W. K. Vanderbilt, Jr., had a match race for \$5000 a side off Long Island Sound on Wednesday, Sept. 28. Niagara IV. won the race by 3m. 50s.

Niagara IV. was designed by Mr. Charles L. Seabury and built at Morris Heights in 1903. She is 110ft. over all, 104ft. waterline, 12ft. 2in. breadth and 4ft. 2in. draft. Her engines are of the Seabury type, and she burns hard coal.

Tarantula was designed by Messrs. Cox & King, and was built in London, in 1902, for the late Col. Harry MacAlmont, from whose estate she was purchased by Mr. W. K. Vanderbilt. She is 152.7ft. over all, 15ft. 3in. breadth, and 4ft. draft. She is equipped with three Parsons turbine engines and Yarrow boilers. She burned soft coal.

The race was under the auspices of the New York Y. C., and Messrs. Eugene Lentilhon and Frank Bowne Jones acted as the Regatta Committee. These gentlemen were on board Rear-Com. Cornelius Vanderbilt's steam yacht Mirage.

The course was from a line between a white flag on the steam yacht Mirage and the Stepping Stones light, to and around the outer buoy, off Eaton's Neck; turning it to port and leaving all buoys to the southward going out and on the return, 39 nautical miles, or 44.85 statute miles.

The preparatory was given at 9 o'clock, and the start was made ten minutes later. The owners of the two boats agreed to cross as nearly together as possible. Tarantula crossed slightly in the lead at 9:11:06, while Niagara IV. went over at 9:11:09.

Tarantula pulled away a little at the start, but when off Execution Light, she dropped back a little, and Niagara IV. drew up.

When off Matincock Niagara IV. was about half a length ahead. Off Oyster Bay she began to drop Tarantula astern. The boats were timed as follows at the outer mark: Niagara IV., 10:05:30; Tarantula, 10:08:15. Niagara had beaten Tarantula 2m. 49s.

On the run back to the finish line Niagara IV. increased her lead steadily, and the race lost its interest. Niagara IV. finished at 10:59:27, Tarantula 11:03:17. Niagara IV. beat Tarantula 1m. 58s. on this leg. The summary:

	Start.	Finish.	Elapsed.
Niagara IV., H. Gould.....	9 10 00	10 59 27	1 49 27
Tarantula, W. K. Vanderbilt, Jr.....	9 10 00	11 03 17	1 53 17

Niagara IV. averaged 21.58 knots, or 24.81 statute miles. Tarantula averaged 20.96 knots, or 24.10 miles.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

MINEOLA CHANGES HANDS.—The 70-footer Mineola, owned by Mr. August Belmont, has been sold to Mr. William Ross Proctor through Mr. Frank Bowne Jones' agency. Mineola has not been in commission since 1902. The schooner yacht Rosemary, formerly the Elsiemarie, has been sold by Mr. John B. Dennis, to Mr. Converse D. Marsh, through the same agency.

DEATH OF F. W. OLDFELDT.—Frank W. Oldfeldt, a well-known yacht builder, died at his home in Brooklyn on September 30. He was 69 years old.

AUXILIARY YAWL MARGUERITE SOLD.—Hon. Geo. Grime, Mayor of Fall River, Mass., has purchased the auxiliary yawl Marguerite from Mr. D. A. Richardson, Hartford, Conn., through the agency of Stanley M. Seamans, New York. She is 45ft. over all, 31ft. waterline, 14ft. beam, 4ft. draft, built in 1902 by Higgins & Gifford, Gloucester, Mass., from designs of W. Starling Burgess. She was taken from Norwich, Conn., two weeks ago, to Fall River where she will be laid up and extensive alterations made for next season's use.

ISLAND HEIGHTS Y. C. OFFICERS.—At the annual meeting of the Island Heights Y. C., the following officers and committees were elected: Com., Frederick A. Downes; Vice-Com., Warren Webster; Rear-Com., Alexander Rennick; Sec'y, Cheston M. Bryant; Treas., Charles E. McKaig; Fleet Captain, Christopher S. Street; Fleet Surgeon, Dr. Henry H. Davis. Executive Committee—Frederick A. Downes, Warren Webster, Alexander Ren-

nick, Charles E. McKaig, Theodore J. R. Brown, G. Harvey Gillingham, Edwin J. Schoettle.

House Committee—Warren Webster, G. Hilton Gantert, William J. Brown, Jr., Charles S. Gardner, George Roden. Membership Committee—Cheston M. Bryant, Charles I. Clegg, Charles W. Allen, Alfred L. Mulford, D.D.S., John Moeller. Regatta Committee—Herbert M. Harlan, Frank Bement, T. R. Coggeshall, Charles H. Stoutenberg, Horace N. Tuttle. Entertainment Committee—S. Stewart Carpenter, A. J. Toulon, Daniel Eagan, Jr., Sidney Conwell, Leon Beck.

NEW RACING BOAT FOR GRAVESEND BAY.—Mr. W. H. Childs, owner of the sloop Medric, has commissioned Mr. Charles D. Mower to design for him a class Q boat for racing on Gravesend Bay. The boat will be in the neighborhood of 22ft. waterline.

CANADA CUP TRIAL RACES.—In order to induce the other Canadian Clubs to enter boats in the trial races for the selection of a Canada Cup challenger, Secretary Porter, of the Royal Canadian Y. C., has written the several Canadian organizations, inviting them to participate. Fifteen hundred dollars has been offered as prize money. The only condition of the trial competition is that all boats must be placed at the disposal of the Selection Committee and be amenable to their orders during the competition. In the event of an outside boat being selected, the craft is to be at the disposal of the Royal Canadian Y. C. until after the race for the cup, which means that the club is at liberty to name both her skipper and her crew.

Canoing.

Officers of A. C. A., 1904.

Commodore—C. F. Wolters, 14 Main St. E., Rochester, N. Y.
Secretary-Treasurer—John Sears Wright, 519 West Ave., Rochester, N. Y.

ATLANTIC DIVISION.

Vice-Commodore—L. C. Kretzmer, L. C. Schepp Building, New York.
Rear-Commodore—W. A. Furman, 846 Berkeley Ave., Trenton, N.J.
Purser—M. Ohlmeyer, Jr., 201 Palisade Ave., West Hoboken, N.J.
Executive Committee—H. L. Pollard, 133 Front St., New York; N. S. Hyatt, Ossining, N. Y.; H. C. Allen, 64 Prospect St., Trenton, N. J.
Board of Governors—R. J. Wilkin, 164 Montague St., Brooklyn, N. Y.
Racing Board—H. L. Quick, Yonkers, N. Y.

CENTRAL DIVISION.

Vice-Commodore—H. W. Breitenstein, 511 Market St., Pittsburg, Pa.
Rear-Commodore—Frank D. Wood, Buffalo, N. Y.
Purser—Frank C. Demmler, 526 Smithfield St., Pittsburg, Pa.
Executive Committee—Jesse J. Armstrong, Rome, N. Y.; H. C. Hoyt, 26 S. Goodman St., Rochester, N. Y.
Board of Governors—C. F. Forbush, 164 Crescent Ave., Buffalo, N. Y.
Racing Board—Harry M. Stewart, 85 Main St., East, Rochester, N. Y.

EASTERN DIVISION.

Vice-Commodore—Henri Schaeffer, Manchester, N. H.
Rear-Commodore—H. M. S. Aiken, 45 Milk St., Boston, Mass.
Purser—Edw. B. Stearns, Manchester, N. H.
Executive Committee—B. F. Jacobs, Jr., West Medford, Mass.; D. S. Pratt, Jr., Wellesley Hills, Mass.; Marcus Butler, Lawrence, Mass.; William W. Crosby, Woburn, Mass.
Board of Governors—Paul Butler, U. S. Cartridge Co., Lowell, Mass.
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; H. D. Murphy, alternate.

NORTHERN DIVISION.

Vice-Commodore—Chas. W. McLean, 303 St. James St., Montreal, Canada.
Rear-Commodore—J. W. Sparrow, Toronto.
Purser—J. V. Nutter, Montreal, Canada.
Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto.
Board of Governors—J. N. MacKendrick, Galt, Ont.
Racing Board—E. J. Minet, 125 Vitre St., Montreal, Canada.

WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, O.
Rear-Commodore—Chas. J. Stedman, National Lafayette Bank, Cincinnati, O.
Purser—Geo. A. Hall, care of Bank of Commerce, Cleveland, O.
Executive Committee—Thos. P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.
Board of Governors—Henry C. Morse, Peoria, Ill.

How to Join the A. C. A.

From Chapter I, Section 1, of the by-laws of the A. C. A.: "Application for membership shall be made to the Secretary, and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

Rifle Range and Gallery.

Zettler Rifle Club.

NEW YORK.—The Zettler Rifle Club held its thirtieth annual shoot at Union Hill Schuetzen Park, on Sept. 26 and 27. Shooters from several states participated.

Mr. T. R. Geisel, of Springfield, Mass., was high man on the ring target. L. P. Hansen, of Jersey City, led by a comfortable margin on the target of honor, and also on the bullseye target. Scores follow: Bullseye target, open to all, best bullseye by measurement to count. The figures indicate degrees: L. P. Hansen 7, Gus Zimmermann 8, M. Dorrier 9, F. C. Ross 12½, H. M. Pope 14, R. Gute 19, G. Schlicht 22, G. Ludwig 25, T. R. Geisel 27½, W. A. Tewes 32, J. Facklam 36, H. Koster 37½, E. C. Maurer 43½, A. Kronsberg 47, C. Smith 49½, P. Donovan 52½, G. Purkes 67½, B. Zettler 67½.

Most bullseyes during the shoot: F. C. Ross 50, H. M. Pope 46, G. Schlicht 38, Gus Zimmermann 36, L. P. Hansen 27.

Zettler trophy target, open to all, three shots free; only one ticket allowed each shooter. A fine trophy presented by the Zettler Brothers: F. C. Ross 72, H. M. Pope 72, A. Hubaleck 68, W. A. Tewes 67, R. Gute 67.

Ring target, open to all, three best tickets to count, for first five prizes. Two best tickets for next five prizes. One ticket for the balance: T. R. Geisel 72, 71, 71-214; M. Dorrier 72, 71, 71-214; H. M. Pope 71, 71, 71-213; O. Smith 74, 71, 68-213; Gus Zimmermann 72, 70, 69-211; G. Schlicht 72, 70, 69-211; F. C. Ross 70, 70-140; W. A. Tewes 70, 70-140; R. Busse 73, 66-139; A. Kronsberg 70, 69-139; C. G. Zettler 71; C. Meyer 70; A. Begerow 69; R. Gute 69; A. Hubaleck 69; J. T. Humphrey 68; L. P. Hansen 67; E. C. Maurer 65; B. Zettler 62; P. Donovan 62; P. F. Schmitt 62; F. E. Chase 62.

Premiums for best five tickets: M. Dorrier 355, T. R. Geisel 354, H. M. Pope 352, F. C. Ross 247, G. Schlicht 247.

Target of honor, open to members only, for prizes presented by the judges and members and \$150 donated by the club: L. P. Hansen 69, H. M. Pope 66, R. Gute 66, F. C. Ross 65, M. Dorrier 65, C. G. Zettler 65, A. Kronsberg 65, T. R. Geisel 64, A. Begerow 64, E. C. Maurer 63, W. Hayes 63, G. Schlicht 63, W. A. Tewes 62, B. Zettler 61, G. Ludwig 61, G. Purkess 61, F. E. Chase 59, C. J. Watson 59, H. C. Zettler 59, W. A. Hicks 58, Gus Zimmermann 58, C. Zettler, Jr., 57, H. Koster 56, O. C. Boyce 53, R. Busse 53, P. F. Schmitt 49, T. H. Keller 38, G. Zimmermann 33, F. Fabarius 19.

Cincinnati Rifle Association.

CINCINNATI, O.—The annual prize shoot of the Cincinnati Rifle Association was held at Four-Mile House, Reading road, Sept. 25, and while the attendance did not come up to its usual standard, it was fairly successful. The day was cloudy and a gray light prevailed throughout the entire shoot. Conditions, 200yds., offhand and rest, at the Standard target, and the results of the day's shoot are summed up as follows:

Offhand, three best tickets to count for the first four prizes and the two best thereafter: Roberts 30, 29, 28; Payne 30, 28, 28; Dodge 29, 28, 27; Odell 29, 28, 27; Gindele 29, 28; Hofer 27, 27; Nestler 27, 26; Lux 29, 23; Drube 27, 25; Hofman 28, 24; Freitag 25, 25; Trounstone 22, 21; Topf 19, 18, Cantzler 16, 8; Gabelman 9; Honart 4.

Rest, conditions same as off-hand: Nestler 30, 30, 30; Hofman 30, 30, 30; Gindele 30, 30, 30; Hofer 30, 30, 30; Payne 29, 28; Odell 29, 28; Topf 29, 28; Dodge 29, 27; Freitag 28, 27; Trounstone, 28; Crantzler 29, 25; Lux 25, 20; Drube 24, 17; Honart 20, 19.

Most points—Offhand: Roberts 1667; Dodge 1048; Payne 808. Rest: Hofman 1468, Nestler 1268; Gindele 527.

Best single ticket—Offhand: Roberts 30. Rest: Nestler 30. Most Flags—Offhand: Roberts 43. Rest: Hofman 63.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

- Oct. 6-7.—Dalton, O., Gun sixth annual tournament. Ernest F. Scott, Capt.
- Oct. 6-7.—St. Marys, Pa.—Two-day shoot.
- Oct. 10-11.—Baltimore, Md.—Baltimore Shooting Association tournament. J. W. Chew, Sec'y.
- Oct. 10-11.—Carthage, Mo.—Seventh tournament of the Missouri League of Trapshooters. Dr. C. B. Clapp, Sec'y.
- Oct. 11.—Batavia, N. Y., second annual fall tournament of the Holland Gun Club.
- Oct. 12-13.—Sistersville, W. Va., Gun Club fall tournament. Added money to all events, and prizes. Ed. O. Bower, Sec'y.
- Oct. 12-13.—Indianapolis, Ind., Gun Club fall tournament. James W. Bell, Sec'y.
- Oct. 15.—Poughkeepsie, N. Y.—Poughkeepsie-Ossining team match.
- Oct. 18-19.—Litchfield, Ill.—Consolidated Trapshooters' Congress.
- Oct. 18-20.—New London, Ia., Gun Club tournament. Dr. E. C. Cook, Sec'y.
- Oct. 20.—Poughkeepsie, N. Y., Gun Club fall tournament.
- Oct. 26.—Concord, Staten Island.—All-day target shoot of the Mullerite Gun Club, on the grounds of the Richmond Gun Club. A. A. Schoverling, Mgr.
- Oct. 26-28.—Blackwell, Okla., Gun Club tournament. Chas. Cornelius, Mgr.
- Nov. 1-3.—St. Louis Mo.—World's Fair shoot; live birds and targets. Alec D. Mermod, Mgr., 620 Locust street.
- Nov. 8.—Bound Brook, N. J., Gun Club all-day shoot; merchandise prizes. F. K. Stelle, Sec'y.
- Nov. 17-19.—Tampa, Fla.—Tampa Bay Rod and Gun Club, \$400 added. J. A. Hansbrough, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The Bound Brook, N. J., Gun Club announces an all-day shoot for Election Day, Nov. 8. Merchandise prizes will reward those who do well.

Mr. Fred Coleman, at the Point Breeze racetrack, Oct. 1, scored 94 in a programme of 100 targets, and in an extra event scored 25 straight, thus breaking 119 out of 125. Sanford was second with 92, Buckwalter third, 87.

The manager, Mr. Chas. Cornelius, writes as that "the Blackwell, Okla., Gun Club claims the following dates for a shoot: Oct. 26, 27 and 28. This is our first effort, and we wish to make it a grand success. We will have \$250 of added money."

Messrs. Schoverling, Daly & Gales, 302-304 Broadway, New York, announce that they have engaged the famous trap and rifle shot, Mr. S. M. Van Allen, to teach ladies and gentlemen who desire to learn how to shoot inanimate targets, and how to shoot in the field.

The tournament of the Recreation Rod and Gun Club, of Morgantown, W. Va., Sept. 27, was a great success. Mr. L. Z. Lawrence made an average of 96.4 per cent. at 140 targets. He gave an exhibition shoot on the club grounds Sept. 30, and broke 97 per cent.

The scores of the contestants in the 50 target races for gold and silver prizes, the fourth of which was held at Brockton, Mass., recently, are as follows, in the total of 200 targets: Dunham 175, Worthing 171, Churchill 164, F. Cavichie 163, Hammond 155, Windle 154. Three more contests were at that time still to be shot to complete the programme. The Montello Club purposes to close the season with a team contest with Harvard.

There is a probability that the Riverton Gun Club, of Philadelphia, will join issue with the State of New Jersey on the constitutionality of the law which in New Jersey prohibits the shooting of live birds at the traps. The first gun has been fired, the pigeon has been killed, and now comes the test case. Our sympathies are with the Riverton Gun Club, but, as a precaution, we commend the study of the strategy displayed by Kuropatkin in making home runs.

Honeybrook and West Chester joined issue in a thirteen-man team race Oct. 1 on the grounds of the latter at West Chester, Pa. Each man shot at 25 targets. The scores were: West Chester—Ferguson 13, Torpy 14, Holland 14, Register 17, G. Smith 13, Farr 15, Young 11, Haines 17, Gill 16, Harvey 18, Long 20, Bennett 20, J. Roberts 22; total 210. Honeybrook—Irwin 21, Hess 12, Pim 9, E. Moore 16, Whiteman 12, Bull 17, Minker 21, Bare 13, Wornert 11, Martin 8, F. Moore 16, Ludwick 15, Ewing 13; total 181.

At the Bloomsburg, Pa., live-bird shoot last week, 12 birds was the number of the main event. The contest is described as exciting, but the inferences as to whether on account of the birds which were missed or otherwise is left to the perspicuous discretion of the reader. Mr. John Fidler lost one out of bounds, and scored 11. The others who "faced the traps" turned their backs on the cashier, as follows: Hagenbuch 6, F. Derr 7, Mercer 7, Harman 6, H. Derr 7, Snyder 5, McKelvy 5, Dent 4, W. Derr 4, Smith 6, Brown 9, Menzbach 6, Moyer 8, Quick 5, W. Snyder 5.

In the series of seven gold medal contests held by the Golden Gate Gun Club, of San Francisco, and which was concluded last month, the winners in the different classes, two high scores in each class, were as follows: Champion class, M. O. Feudner and A. J. Webb; first class, George Sylvester and E. Klevesahl; second class, H. P. Jacobsen and H. Klevesahl. The Bekeart challenge cup contest had a remarkable tie between Messrs. Emil Holling, C. C. Nauman and A. J. Webb, on 92 out of 100. In the shoot-off at 50 targets, Nauman won by a score of 49 out of 50.

Mr. H. W. Bissing, under date of Oct. 1, writes us that "a few shooters appeared on the grounds of the Poughkeepsie Gun Club on Sept. 22, and Hans won both the Condit medal and the 1,000 Peters shells. The scores on Sept. 28 show up very well. Mr. W. A. Adriance secured a win on both the above prizes. Mr. Adriance shot at 100 targets and broke 89. Mr. A. L. Traver and Hans shot at 125 targets each, Traver breaking 87 per cent. and Hans 84. The club grounds are in elegant condition, and the club looks for a large attendance at their fall tournament, Thursday, Oct. 20."

The second annual fall tournament of the Holland Gun Club will be held in Agricultural Park, Batavia, N. Y., Oct. 11. The programme contains seven events, 15, 20 and 25 targets, entrance \$1.50, 2 and \$2.50; like amounts to be added. Totals, 120 targets, entrance \$12; added money, \$12. Shooting commences at 10 o'clock, rain or shine. Targets 2 cents. Experts may shoot for targets only. Event No. 7, club handicap; members only who have shot at least 50 per cent. of the above programme are eligible to enter; 25 targets; entrance \$2.50; added money \$5. Rose system, 8, 6, 4, 3, 2. More events will be added if the shooters desire and time will allow.

At the closing 1904 tournament of the Interstate Association, held under the auspices of the Concordia, Kans., Blue Ribbon Club, Sept. 28-29, Messrs. Heer and Spencer were first and second respectively in the professional high averages of the two days. On the first day they tied on 185 out of 200. Messrs. Marshall and Money were second and third respectively with 180 and 179. On the second day the high averages were Messrs. Heer, 195; Spencer, 191; third, Marshall, 189. Amateur high averages were: First day, Messrs. Geo. Maxwell, 181; E. Arnold, 172; J. L. Jones and Geo. Lewis, 170. Second day: Amateur, Messrs. E. Arnold, 189; E. L. Wetzig 184; H. Anderson, 182. The total target programme each day consisted of 200 targets.

The programme of the Poughkeepsie, N. Y., Gun Club, provided for the club's fall tournament, Oct. 20, consists of eight events: four at 15, two at 20 and one at 25 targets; entrance \$1.30, \$1.60 and \$2. No. 8, 25 targets, is the merchandise event, open to all. It has ten valuable prizes. Lunch and refreshments. Purses divided Rose system. Targets, 2 cents. Manufacturers' agents, professionals and others who desire, may shoot for targets only, at 2 cents each. Shooting begins at 1 o'clock. Hourly trains from New York and Albany. Electric cars (Vassar College) from railroad station stop close to shooting grounds. High average for the programme, professionals or amateurs, first, \$5; second, \$3; third, \$2. Ship cartridges to H. W. Bissing. Free delivery to grounds.

Mr. C. G. Blandford, Captain of the Ossining Gun Club, is well and favorably known among his associates, socially, in business and in sport. His high standing requires no indorsement. Elsewhere in our columns we publish a circular letter from him concerning the organization of a new trapshooting organization, the Gun Bugs' Association of the United States and Canada. The purposes are to promote acquaintance and good-fellowship. The circular explains in detail the advantages of membership. Mr. Blandford informs us that he corresponded extensively with trapshooters, of whom 600 were gun club secretaries, concerning their opinions, and he met with such a responsive approval that he felt that success was assured. Mr. Blandford will be pleased to give full information to all applicants.

The programme of the eleventh annual fall tournament of the Baltimore Shooting Association, to be held on Oct. 11, is for amateurs. In purses and prizes, \$200 added. The events will be at targets and live birds. On the first day ten target events are provided, at 15, 20 and 25 targets, entrance \$1.30 and \$1.40, and \$5 and \$6 added. Events 9 and 10 are merchandise, 25 targets, \$1 entrance, high guns, twenty prizes in each event. There are eight target events on the second day's programme, of which seven are at 20 targets, \$1.40 entrance, \$5 added, and one at 25

targets, merchandise, entrance \$1.50. These are followed by two live-bird events, one of which, the Maryland Handicap, will be at 15 birds, entrance \$10, silver cup to the winner; class shooting, 50, 30 and 20 per cent.; handicaps 25 to 32yds. Event 2 will be at 10 birds, \$5 entrance. A handsome gold medal, donated by Mr. A. R. Middleton, will be given to the winner. Targets 2 cents. Sliding handicap to prevail. Purses divided old system, 40, 30, 20 and 10 per cent. Paid representatives shoot for targets only. The merchandise event each day will be handicap, distance 16 to 20yds. Three high average moneys will be given to the amateurs shooting the two days' programme; \$6 to first, \$5 to second, and \$4 to third. First class loaded shells will be for sale on the grounds. Shooting to commence promptly at 9:30 A. M. each day. Ship shells in care of J. R. Malone, 2671 Pennsylvania avenue, Baltimore, Md. Five dollars will be given to the paid representative making the high average for the two days. A gold medal, value \$15, for high average for two days, on targets, for amateurs. Handicap committee: Dr. H. E. Lupus, J. R. Malone, J. W. Chew, H. E. Chelf.

BERNARD WATERS.

Riverton Test Case.

THE New York Times of Oct. 1 published the following concerning the matter of the New Jersey State law which prohibits the shooting of birds at the traps:

Riverton, N. J., Sept. 30.—The test shoot to determine the constitutionality of the law passed by the New Jersey Legislature last winter prohibiting the shooting of live pigeons from traps, was held at the Riverton Gun Club this afternoon. The shooting was done by R. F. Harned, of Merchantville, and Charles W. Davis, of Philadelphia, in the presence of Constable Anderson Shinn, of Burlington, who represented Prosecutor Atkinson, and officer J. J. Tomes, of Palmyra, who were there as witnesses. Owing to the high wind, Harned missed his bird, but Davis killed his.

After the shooting the party left for Philadelphia. When interviewed, Mr. Harned said: "There is nothing to say. The test shoot has been made, and the law will now take its course. We don't want a lot of publicity about this matter, which is done solely to determine whether or not the members of this club can be prevented from using live pigeons in its shooting matches."

The Riverton Gun Club is represented by the law firm of Lindley, Depew & Folks, of Jersey City. Attorney Samuel P. Rotan, of Philadelphia, was with the party to-day. The matter will be brought to the attention of the Grand Jury of Burlington county at the October term of court, which convenes next week. After the jury has found a bill, the club men will be cited to appear for trial. If the decision in the county court is adverse to the club an appeal will be made to the New Jersey State Supreme Court.

Springfield, Mass., Shooting Club.

SPRINGFIELD, Mass.—This club closed the trapshooting season by holding a practice shoot on their grounds at Red House Crossing on the afternoon of Sept. 28. This was the last shoot of the club until Christmas, when they will hold their annual turkey shoot.

The past season has been a very prosperous one for the club, and a great deal of interest has been taken in shooting by members and their shooting friends. The club have been running a badge contest during the season, and the badge was awarded to Douglass, as his average for shooting throughout the season has been the highest of any of the members who completed the ten shoots called for in badge contest. His average for the ten shoots was 66 per cent., shooting from the different marks between 16 and 25 yards. Kites came second, and W. H. Snow third.

Scores by events follow:										
Events:	1	2	3	4	5	6	7	8	9	10
Targets:	10	10	10	10	10	10	10	10	10	10
Kites	5	8	10	5	7	7	6	9	8	8
Snow	3	8	7	8	5	5	5	10	9	6
P. Lathrop	5	5	6	5	6	7	5	6	4	5

*Varela. †Judd.

Indianapolis Gun Club.

INDIANAPOLIS, Ind., Sept. 24.—In the practice events, the totals shot at and broken are appended:

Shot at.		Broke.		Shot at.		Broke.	
Morris	50	42	Moore	80	59		
Dickman	150	125	Gregory	115	105		
Medico	105	90	Moller	155	131		
Finley	80	66	Robison	110	46		
Armstrong	100	58	C. Henry	50	27		
Anderson	95	74	Hice	65	30		
Goodrich	60	33	Bell	90	73		

For Morrison cup, 50 targets, distance handicap: Gregory (17) 46, Finley (18) 43, Moller (18) 40, Bell (18) 39, Medico (17) 39, Moore (17) 38, Dickman (18) 37, Anderson (16) 36, Armstrong (16) 29, Robison (14) 22, Hice (14) 22.

Strong wind and cloudy, making targets very hard.

Team shoot, Sept. 20, 50 targets:

Indianapolis—Michaelis 38, Britton 42, Cooper 46, Wands 39, Parry 39, Tripp 38; total 242.

Crawfordsville—Snyder 34, Cook 31, Long 42, Stillwell 43, Voris 41, Deitrich 45; total 236.

WESTERN TRAP.

Lincoln Tournament.

LINCOLN, Ill., Sept. 27.—The two-day tournament held here last week was fairly well patronized by a true lot of stickers, and with the special matches, the total of 500 shots was registered for the two days.

The weather was not the best, rather windy, which handicapped all but Gilbert. He came in the day before, and got a line on the targets by smashing 100 straights, and the streak followed him during the tournament days. Crosby only fell behind two the first day. John Boa closed up on the leaders the second day. Frank Riehl has not fully recovered from his Southern trip. Then there were Young, Vietmeyer and Cadwallader, each having some bad half hours.

Wiggins and Powers, from the 19yd. line, had a hot race for the high average, with Wiggins the winner by four targets. Others shot well, especially A. Lawrence on the second day, when he changed his loads as to powder.

The Lincoln Club, with Dr. Lawrence as head pusher, can command the attention of all the shooters whenever they send out invitations for a shoot. Yes, they will come, all in a body. Scores:

Sept. 20, First Day.

Shot at.	Broke.	Shot at.	Broke.
Riehl, 16.....	250	Haws, 16.....	200
Young, 16.....	250	Bockwitz, 17.....	211

At Evansville.

Evansville, Ind., Sept. 25.—The gun club of this city experienced a busy day Saturday, when a tournament was held. The attendance was fair, yet most of the shooters were rather outclassed. Al. Wellerding, the president of the club, forged to the front, and was the surprise of the meeting, while Chris. Heuer shot finely for a new man at the traps.

The professionals came well to the front, John Boa, of the Winchester, leading with 185 out of 200. C. O. Le Compte with 179 was second; Dell Grass third with 170. Many were quite taken up with the exhibition of Mrs. Theodore Pfeiffer, who in two events made an excellent record. James Winston, of Sturgis, Ky., took part in some of the events.

At Lomax.

Lomax, Ill., Sept. 30.—There was something doing yesterday when the boys gathered at the traps. Not a large attendance, yet there was some fine shooting done by Mr. Rambo from Knoxville, Ill., who lost but 9 out of 215. Smith, Gibson, Wagener and Cook were all about on a par.

Mr. Wagener is a well-known trap promoter, and here proved a good manager. The wind was strong enough to boost the targets during the forenoon, but in the afternoon it was perfect. Dr. C. E. Cook, the New London, Ia., tournament promoter, was present, taking advantage of the opportunity to interest all in his fall tournament. He shot well, and interested all in the line of fancy shooting. C. D. Baxter, of Warsaw, Ill., was present, and he got several in line for his shoot, to come off Oct. 12. Shooting at 215 targets, Rambo broke 206, Smith 193, Gibson 192, Wagener 189, Cook 188.

In Other Places.

Oct. 1.—By breaking 24 out of 25, Wolf won the trophy at the Pastime Gun Club, of Detroit, Mich., Saturday last. The medals went to Tolsma, Class A; Whitmore, Class B; White, Class C; Hannebauer, Class D.

The Arcola, Ill., Gun Club held their banquet at Schneider Hotel Saturday last. After the feast considerable speech-making was indulged in, followed with a resolution to increase the membership.

The Bristol, Conn., Gun Club held a shoot and barbecue on last Friday, same being well attended. Shooters came from Hartford, Willimantic, Waterbury and New Britain. The weather was cold, wind strong, yet two made straight scores, viz., Dr. Morse, of Waterbury, and Burk, of Rockville. It was a strange sight to see shooters, at this time of the year, gathering around a warm stove to be comfortable. Ezra Norton was the manager. E. R. Burwell, one of the enthusiasts, was not present owing to the doctor's orders to remain abed.

The wind caused the targets to zig-zag at the ocean side on Sunday last, when the Bluerock Shooting Club, of Riverside, Cal., met. Shooting for a \$50 cup, was a hot race. J. M. Kolb and Melville Goetz, for the Oceanside team won with 42. Frank S. Ecker, of San Diego, took away the principal merchandise event on 24 out of 25.

The Sparta, Tenn., Gun Club last Friday, after a hot contest with the Nashville team, won the loving cup with 523 out of 625. Sparta and Tracy tied for the second prize, and on the shoot-off there was a disagreement as to the score. The scorer made Tracy win. A. Meaders was high gun, getting 107 out of 125. At the last meeting of the club the gold medal went to Mr. Attie Kinsley, who scored 97 out of 125.

Genoa, O., Gun Club had a tilt with Toledo on Sept. 24, and came out ahead by 6 targets. Volk, for Toledo, was high man with 42 out of 50, and yet two of his associates went as low as 32.

F. H. Shearer is proving too strong for the Bay Cityites, Mich., as he has won the medal four times. Though the wind was strong, Shearer, Bradfield, Merrill and Maxson made a tie on 36. Shooting off, Shearer won.

The secretary at Bloomington, where the club takes in the whole county, writes that advices have been received that it was not against the law to shoot live birds in Illinois. It may occur to some interested people that because live birds are not shot in Chicago, that same are not permitted in the State. The opposition and the activity of the Humane Society has almost prohibited large shoots.

Now and then the Atchinson, Kans., trapshots take up the sport; so Oct. 2 and 3 was selected for a shoot, and with valuable prizes, the Missouri Valley shooters surely appreciated same by their presence.

There is a movement, with every prospect of success, now being pushed by the noted Sam S. Young, of Toronto, O., whereby the members of the Ohio Valley Rod and Gun Club will have a home that will be second to none. The club will be an exclusive one, and will be fitted up so that those who desire may take up a permanent residence. The home will overlook the Ohio River, and is located at Jeddo.

On last Saturday hunter's licenses were issued at Springfield, Ill., as follows: Bert Dressendorfer, T. J. Dunn, Joseph Radske, George Streibel, Sherman Brown, W. D. Edwards, Bud, Brandon, H. S. Castle, Jr., and Col. J. R. B. Van Cleve.

The Manning, Ia., Gun Club held a tournament Sept. 27 and 28. Fred Whitney was selected as cashier, as the club is composed of business men, and they believe in doing business in a business-like manner.

Trapshooting at Colorado Springs, Colo., has been quiet, though late advices are that same will be revived with the opening of October.

The Valley Beagle Gun Club, of Martin's Ferry, Va., held a prize shoot Saturday last.

The Meriden, Miss., Gun Club members must content themselves with target shooting, as their time on game has not arrived yet.

Hugh M. Clark, of Wabash, Ind., writes that he will be at Fort Wayne, Ind., Oct. 2, and shoot the live-bird match with Max Witz. This will decide the championship, and a \$100 bet, being one of the few live-bird matches pulled off in the State.

E. G. Wallace, secretary of the Marshalltown, Ia., Gun Club, writes that he just got home from the St. Louis World's Fair, to find that the club is ripe for a tournament, and though notice is short, will hold same Oct. 13 and 14.

O. N. Ford, secretary of the Wapsie Gun Club, at Central City, Ia., has written that a tournament is to be held at their grounds Oct. 25. This will give the Iowa boys a chance to get in form before coming to the World's Fair Handicap.

Ed. Dorman, of Cookeville, Tenn., won the lamp that fell to the lot of the Algood Club, when they held the team contest. In doing this, he outshot Samuel Powell, of Algood.

Hartman is now wearing the badge of the Bridge City Gun Club, that he won at their last meeting, at Logansport, Ind. He scored 22 out of 25 targets.

The Franklin, Tenn., Gun Club, through its president, W. J. Polk, has challenged the Hermitage Club to a contest for the Peters cup. They stack evenly up on their past scores, shooting in all at 1,250 targets, Franklin leads now by just one small target. The next shoot is set for Nashville, Oct. 4.

C. E. Doolittle did something Saturday, as he won the Upson medal for keeps at the shoot held by the Cleveland, O., Gun Club. Though the rain fell and the weather was bad, he broke 35 out of his 40 targets, and that was high score.

At the regular shoot of the Tipp, O., Gun Club, C. O. King won the medal with 20 out of 25. S. C. Hawyer, shooting at 5 targets as fast as they came from the trap, using a pump, broke 30 out of 35.

The Ewell Gun Club, of Spring Hill, Tenn., is right in line for steady shooting. The Saturday shoot found W. E. Babb on top.

The Jackson Gun Club, of Jackson, Miss., held a tournament Sept. 27. There were representatives present from Vicksburg, Greenville, Natchez, Hazelhurst and Rolling Fork, but up to this writing the scores have not reached the office.

When the Paducah, Ky., Gun Club tournament closed there were 400 live birds remaining in the coops, and it is proposed to hold a shoot open to all. This should be a drawing card, and add another interesting page in the history of the famous Paducah Club.

The Le Mars, Ia., Gun Club last week completed its series of shoots for the prizes hung up for the season. W. C. Kern, with 184; won first prize; L. L. Jones, 165, second; H. J. Fuller, 164, third; H. N. Kern 162; E. W. Edgington 162, Herman Prust 158; C. W. Cunningham 147; Theo. Love 146; L. Hearling 143; J. Eilenbecker 122. The membership was large, and the interest great throughout the season of 1904.

The fourth annual shoot held by the Evansville, Ind., Gun Club brought J. Boa to the front as winner with 185 out of 200. C. O. Le Compte scored 176.

The farmers at Runge, Karnes county, Tex., have organized the Farmers' Shooting Club, the incorporators being Chas. F. Grosse, William J. Schorre and Charles F. Schrode.

The quail season, which opens in the Oklahoma Territory Oct. 16, promises well. The plover and duck shooting is reported good. Reports from Alvin, Tex., convey the impression that there is much enthusiasm shown by the citizens as to target shooting. W. W. Browning wears the medal until defeated.

At the last meeting of the Janesville, Wis., Gun Club until the game season is over, held Friday, J. H. McVicar, W. McVicar and A. Kineow were tied with 41 each out of 50.

The regular monthly shoot of the Illinois Gun Club, held last Friday, brought out Tom Hall, of Loami, as the winner. Can't beat a man who kills them all. John H. Caldwell killed 23, W. H. Masters, of Jacksonville, 23; John H. Sikes, 22. After the live-bird contest, all engaged in some practice at clay targets. It should be remembered that Springfield has one of the finest shooting parks in the whole country. No finer grounds could be selected for the holding of a national event similar to the G. A. H. The last large gathering of the Illinois sportsmen was held on these grounds.

The Opolis, Kans., Gun Club, will soon start up by reorganizing.

The race at Sandusky, O., between Schnaitter, Jr., and Deist was a hot one for the season's average. If Diest had run his last 25 straight he would have tied. The scores of 178 and 175 out of 200, considering that only 25 targets were shot on each of eight different days, was very good.

The new officers of the Waverly Gun Club, Lansing, Mich., which were elected last week, are James R. Elliott, President; Frank G. Row, Secretary; E. C. Ewer, Treasurer; Fred J. Hopkins, Captain.

A shoot was announced for Atlantic, Mich., on live birds, but the officers turned up and showed that the laws of Michigan do not permit of pigeon shooting. At least that was the law of 1897. Possibly times and dates have changed the law.

A charter has been granted to the Toronto Rod and Gun Club, of Toronto, O.

The shooters of Massillon, O., are a little languid about getting out to the trap, as some of them prefer hunting the lively squirrels at the present time of the year.

The match between the Kenosha Gun Club and the Waukegan, Ill., Gun Club, which was to have taken place last Saturday, was postponed, as the Kenosha boys could not get away in a body.

Cincinnati Gun Club.

Cincinnati.—October 1 was an ideal day for the sport, but only a limited number availed themselves of the opportunity for a pleasant outing.

This is the last shoot in the series.

Oct. 7, the ten men who are in the tie will have their handicaps revised and shoot off at 50 targets. Fifty-six members have shot in one or more of the series, twenty-five of them in the required fifteen. Of these, ten are credited with ten or more straight scores, including their handicaps.

The table below shows the number shot at and actually broken, and also the ten best scores of the tie men. Gambell made over 91 per cent. in his ten best scores, but missed being in the tie by 1 target, having only nine straights, including his handicap.

George McDuff, one of the old-timers, took part in the sport to-day. John Penn, the first secretary of the club, always gets out to the grounds, if he is within any reasonable distance.

There were three scores shot in the cup race to-day: Harig 22, 23 and Medico 23. There are now sixty-one entries.

Ackley did fine work to-day, shooting an 80 per cent. clip, and he was congratulated by all the boys. It is a pleasure to see him do well. Maynard has returned from his trip to Minnesota. He reported having had a good time, but he missed the cream of the chicken shooting.

Medico and a friend had some good-dove shooting the other evening along the Miami River, about two miles east of Plainville. They got the full limit.

Mr. Le Roy Leach, of Omaha, has been spending a few days in the city. He states that he may take a trip to England and give an exhibition of his skill at rifle shooting, as he has been asked to do so by several Englishmen who have seen him shoot. He is 32 years old, a civil engineer by profession, and has not been in the shooting game many years.

Parker prize gun contest, 100 targets, handicap of added targets: Penn (10) 100, Randall (15) 100, Maynard (18) 100, Harig (40) 100, Peters (20) 100, Ackley (35) 100, Roberts (25) 100, Boeh (40) 100, Pfeiffer (40) 100, Kramer (40) 100, Wallace (40) 100, Tuttle (40) 100, Keplinger (40) 100, Kenan (60) 100, Jay Bee (25) 98.

Scores made by those who have shot in the required number of events in the Parker gun series:

	Shot at.	Broke.	Av.		Shot at.	Broke.	Av.

 Boeh.....77 74 73 71 68 68 66 65 64 61—687

A match was shot on Sept. 23 between four-man teams of the Genoa, O., Gun Club and the Toledo Consolidated Gun Club, at 50 targets per man, resulting in a victory for the former by a score of 149 to 143.

Henry Clay Culbertson, a well-known sportsman of Cincinnati, passed away on Sept. 27. He had been in poor health for over two years, but was able to be around until last March. Since then he has been confined to his bed. He was a member of one of Cincinnati's pioneer families. His death is the twelfth which has occurred among the members of the Cuvier Club since Jan. 1, of this year. The list includes James Heekin, Gov. Asa S. Bushnell, Joseph Zanoni, A. J. Thorpe, John L. Stettinius, Robert Allison, John B. Bobe, O. B. Farrelly, John H. Hibben, Judge Carl Nippert and Col. T. W. Paxton.

The Dayton Gun Club held a meeting on Sept. 29. There was a full representation of the stockholders, and much enthusiasm was manifested in the plans for the future growth of the club. The club was incorporated recently, and has been formed into a permanent organization. The grounds have been paid for, and many improvements will be made in the near future. The officers elected were: John L. Theobald, President; Andrew Kempert, Vice-President; O. H. Bailey, Secretary; J. L. Curphey, Treasurer. Executive Board: Zenas Craig, Chas. W. Sanders, C. H. Cord.

Five-man teams of the Silver Lake Gun Club, Bellefontaine, and the Urbana Gun Club, shot on the former's grounds for the Silver Lake trophy. The match was at 25 targets per man, and was won by Urbana by 8 targets, 100 to 92.

The "Debut" tournament of the Trenton, O., Gun Club, on Sept. 28, was enjoyed by all present. The attendance was very good, there being quite a number from nearby towns, and among them the two well-known lady shots, Mrs. Ayres, of Hamilton, and Mrs. Evans, of Dayton. The trade was represented by Ralph Trimble, who was high gun with 164.

After the hardest fight he ever put up, H. Oswald won the medal race of the Rohrer's Island Gun Club, Dayton, on Sept. 28. The last shoot in the series of thirty-five for the handicap medal will take place on Oct. 26, and the member who has won it the greatest number of times will be presented with a handsome loving cup. Miller has led in the race since May 18 and has six wins to his credit. P. Hanauer is second with five.

On Sept. 24 an interesting match was shot on the Dayton Gun Club's grounds between the fat and lean men of the club, six on each team, 50 targets per man. A good crowd assembled to see the sport. At the close of the first round the heavy-weights were 12 targets ahead; score, 116 to 104, Schwind making a straight, and Capt. Craig losing but 2 targets. The extreme heat of the day seemed to have an exhausting effect on the fat men, and they did not do so well in the second round, losing by a score of 107 to 104, leaving their total lead 9 targets, the scores being: Fats, 220; Leans, 211. Fat team—Schwind 46, Capt. Craig 43, Leseur 37, Sandusky 33, La Rue 31, Clark 30; total 220. Lean team—Capt. Lindemuth 40, Tibbals 39, Whitacre 37, Cord 37, Brandenburg 34, Strausburg 24; total 211.

Ossining Gun Club.

OSSINING, N. Y., Oct. 1.—Am inclosing scores of the Ossining Gun Club, made to-day. A high wind, blowing directly across the trap, made shooting exceedingly difficult. Ray Hendricks, of Rye, N. Y., did the best work, breaking his targets close to the traps.

C. G. B.

Interstate Association at Concordia.

CONCORDIA, Kans., Sept. 30.—The closing tournament of the Interstate Association series for 1904 was held at Concordia, Kans., Sept. 28 and 29, under the auspices of the Concordia Blue Ribbon Gun Club.

Rain frequently plays havoc with baseball, football and other sports, but it will not stop a shooting tournament. It dampens enthusiasm, but the various events go on just the same. Such was the case the opening day of this tournament. The wind blew a gale while the earlier events were being shot, and the contestants had many disadvantages to contend with. In the afternoon it rained furiously for a short time, and Manager Shaner was wishing for a "cyclone cellar" for his trapper boys and traps before the storm was over. The scores will show, better than can be told, how hard the shooting was.

Twenty-six contestants took part in the first day's events and of this number sixteen shot in every event.

Among the manufacturers' agents, Messrs. Heer and Spencer tied for first place with 185 out of the 200 shot at; Mr. Marshall was in second place with 180, and Mr. Money third with 179.

Among the amateurs Mr. Geo. Maxwell was easily in first place with 181 out of the 200. This is more remarkable from the fact that Mr. Maxwell has but one arm. Mr. Ed. Arnold was in second place with 172, and Messrs. J. L. Jones and Geo. Lewis were tied for third with 170.

The second day was a perfect day for trapshooting, and there was a general improvement in the individual scores made.

Mr. Heer was again high man among the manufacturers' agents with the fine score of 195 out of the 200 shot at; Mr. Spencer was second with 191, and Mr. Marshall third with 189.

Among the amateurs Mr. Ed. Arnold was first with 189; Mr. E. L. Wetzig was second with 184, and Mr. H. Anderson third with 182.

For general average, Mr. Heer was first among the manufacturers' agents with a score of 380 out of the 400; Mr. Spencer was second with 376, and Mr. Marshall third with 369.

For general average among the amateurs, Mr. Ed. Arnold was in first place with 361, Mr. Geo. Maxwell second with 360, and Mr. Geo. Lewis third with 347. The scores of both days follow:

Sept. 28, First Day.

Events:	1	2	3	4	5	6	7	8	9	10	11	12	Shot

Norton	22	3	Clark	17	1
Weller	21	4			18

Waterloo Gun Club.

WATERLOO, Ia.—The two-day shoot of the Waterloo Gun Club, Sept. 22 and 23, had a number of famous trapshooters in the competition. There were Messrs. Fred Gilbert, C. W. Budd, Fred Whitney, F. C. Walker, and C. Freed, of Jesup; O. N. Ford, of Central City; L. M. Howell, of Dows; E. M. Russell, of Union, Ia.; W. S. Hoon, of Jewell, Ia.; R. L. Slimmer, of Clarksville; J. H. Ransom, of Mason City; Ed. Frees and Frank Burkhardt, of Boies; F. H. Lord, of Chicago; Clarence Wise, of Cedar Falls; J. F. Duis, of Des Moines; Guy Burnside, of Knoxville, Ill.; Fred Shafer, of Waverly.

The home shooters were E. E. Hageman, J. C. Hartman, Ralph Storm, Ed Storm, Rob Jackson, Carl White and Henry Steege.

Sept. 22, First Day.

The programme events numbered fourteen. Each event was at 15 targets, a total of 210:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	Total.

FOREST AND STREAM

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, OCTOBER 15, 1904.

VOL. LXIII.—No. 16.
No. 846 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iii.

THE WATER POLLUTION PROBLEM.

THE members of the Altoona Rod and Gun Club and Fish and Game Protective Association, in a letter printed elsewhere, announce their purpose of endeavoring to suppress the pollution which is filling their streams with dead fish. They have set out to accomplish this end by friendly conference with the proprietors of the offending establishments. This is most commendable in spirit; but the experience of those who have had to do with attempts to abate such nuisances does not warrant a belief that substantial results are to be looked for from the friendly conference. A manufacturer finds it much cheaper to drain the factory waste into a stream which will carry it away, than to provide for the disposition of the refuse on the premises. The destruction of the fish, the pollution of the water, the creation and maintenance of what is in fact, if not in law, a public nuisance, all these are secondary and minor considerations which have no weight as against the one item of avoiding expense. This has been the history of stream pollution in Pennsylvania as elsewhere.

For years the successive boards of fish commissioners of Pennsylvania have sought some practicable means of ending the destruction of fish by the waste from tanneries and other manufacturing establishments. Mr. Henry C. Ford, well remembered for his long and public spirited service in a former commission, once wrote to the FOREST AND STREAM, in response to complaints from afflicted districts on the Youghiogheny River:

"I am in receipt of many communications of similar import from other parts of the State, and regret to say that we have no law in Pennsylvania that will prevent such pollutions of our streams. This has not been the fault of the Commissioners of Fisheries, for at the last two sessions of our Legislature we introduced an act to prevent the discharge of refuse of tanneries, wood acids, etc., into the waters of the commonwealth. It was defeated each time by the efforts of members of the Legislature from the very districts affected by such nuisances. It is the intention of the commission to introduce a similar act at the next session of the Legislature."

The new measure referred to met the fate of the others. There is in Pennsylvania to-day no law which can be enforced to remedy the evil of water pollution.

Nor is there any probability that a perfect anti-pollution measure could ever pass the Legislature. The Supreme Court of Pennsylvania some years ago made a ruling on *ex post facto* laws, which presumably would defeat legislation designed to affect established industries. Moreover, a drastic measure would wipe out of existence several small towns which are dependent upon industries involving water pollution, as well as the industries themselves, which represent millions of invested capital. These conditions have prevailed against legislative action in the past, and would continue to prevail against any future efforts along this line.

Cognizant of the perplexities of the problem, and of the apparently insuperable obstacles to a full remedy, the present Commissioner of Fisheries, Mr. W. E. Meehan, is preparing a bill which is a compromise measure. It aims to prevent any new pollution of the streams, and the gradual extinction of the pollution which now exists. Under the provisions of the rough draft now prepared, it is proposed to make it illegal for any person or corporation to build a new industry to empty any waste deleterious to fish life into any streams of the Commonwealth; and wherever the State Board of Health and the Department of Fisheries unite in declaring that any existing pollution by establishments erected before the passage of the act is deleterious to both human health and fish life, the nuisance shall be abated at the expense of the State. The question as to whether it shall be at the joint expense of the State and the owners of the

establishment is yet under consideration and not decided. A number of newspapers in the State have discussed the proposed bill approvingly without exception, and many of the established industries declare they will not oppose its passage.

The compromise measure here outlined is the most promising movement we have yet recorded for Pennsylvania public water reform. Commissioner Meehan should have the hearty support and cordial, active co-operation of all associations like the Altoona Rod and Gun Club. By uniting forces and working in unison for the common cause, individuals and clubs may find in this law proposed by Mr. Meehan the best attainable solution of what has so long been a vexatious problem.

The evil, and the powerlessness of the representatives of the people to remedy it, are by no means peculiar to Pennsylvania. There is perhaps no single State where in greater or less degree the small streams and the rivers are not in an abominable condition because made sewers for factory waste. If the most we can hope for is, as in Pennsylvania, a compromise and a partial remedy of the evil, let us have at least that. The outcome of the campaign projected for Harrisburg next winter will be looked for with much interest.

GREECE AND ITALY.

OUR Boston correspondent records another personal encounter between a game warden and a foreign shooter. The warden came upon two Greeks killing song birds, and when he undertook to arrest them, received into his body a charge of bird shot, and was removed to the hospital. These Greek and Italian and other foreign-born shooters have become an unmitigated nuisance, a peril to life and a very considerable factor in the destruction of song and insectivorous and game birds. They are found all over the country. New England is full of them. New York has an army of them. New York city is the fourth city of the world in its Italian population, only Rome, Naples and Milan are larger. All about the city, in outlying districts of Westchester county and on Long Island, the roads and fields and woodlands are infested with Italian bird shooters, both week days and Sundays. New Jersey has its quota. In Pennsylvania they have given so much trouble that the Legislature has sought to check the evil by requiring the unnaturalized gunner to take out a gun license, for which he must pay a fee of \$10. But in Pennsylvania, as elsewhere, because of inadequate execution of the law, the evil has been but partially checked. Secretary Kalbfus, of the Game Commission, relates a characteristic incident illustrating the lawless, wanton, and murderous nature of this class:

We have in this office information showing the shooting of five citizens during the past fall by these people, and for no other reason—all of them deliberate and willful. One gentleman living near, if not quite, inside the city limits of Pittsburg, saw three Italians shooting song and insectivorous birds in his orchard and ordered them off his land. One of the foreigners said: "This is a free country; we don't have to go." To this the owner replied: "Yes, you do," and thereupon received two loads of shot in his stomach and legs; fortunately, not killing him, although he was compelled to stay in the hospital for many weeks.

In another Pennsylvania case a deputy game warden of Pittston, who undertook to arrest three Italians found killing birds on a Sunday afternoon, was fired upon by them, and saved his life only because he was quicker than his antagonists, and "got the drop" on them. The story might be repeated again and again. The Italian immigration is bringing to us hordes of people who dream that America is a free country, which means to them in this particular respect a country where every mother's son of them is free to carry a gun anywhere and at any time, and to shoot anything that flies, without let or hindrance.

It would be a great mistake to imagine that these foreign-born shooters and bird snarers are confined to the neighborhoods of the large towns. On the contrary, they are scattered over the country, and their destructive work is not confined to any one climatic zone. The South as well as the North has its Italians; and the killing of small birds there in the winter is on a greater scale than in the North, because certain birds which in the North are separated, in the South are congregated in flocks, and are more easily killed because in multitudes.

How shall we control this pernicious element in its relation to the life of the field? Manifestly the remedy may be found in abridging the privileges of the man with the

gun. The time will shortly come—if it is not already here—when the old-time freedom of carrying a gun must give place to such a system of licensing, regulation, and control as will first keep out of the fields the irresponsible and lawless; and second, secure to the responsible and the law-abiding the fullest privilege compatible with public interest. In short, we are reaching a point where shooting and the carrying of guns must be classed as privileges accorded under restriction, and not as rights exercised without leave asked of anyone.

THE Association for the Protection of the Adirondacks is doing a good work in distributing the report of H. M. Suter, agent of the Bureau of Forestry, on the "Forest Fires of 1903 in the Adirondacks." As will be remembered, the fires of that year were of the most serious nature, entailing a loss exceeding \$1,000,000. They were far beyond the power of the fire warden service, as then constituted, to cope with. And the serious aspect of the subject, which makes worth while this distribution of the report of the Association, is that under like conditions of a protracted drouth, the State would now be no better fitted to cope with Adirondack forest fires than it was in 1903. New York suffered its loss then; but it has not profited by the lesson. The Legislature of last winter was not equal to the demand upon it to provide for a competent study of Adirondack conditions, which might furnish a basis for an adequate scheme of fire protection. The Legislature, for session after session, is content to intrust its forestry affairs to junketing commissions who are not fitted by technical education and training to investigate the Adirondacks intelligently and to report upon them in a way to merit public confidence. So long as the penny wise and pound foolish policy of Governor Odell shall prevail, with respect to the forests of the North Woods, we may not look for any radical betterment. The only hope for a change is in an enlightened and aroused public sentiment; and this must be created by such associations as that for the protection of the Adirondacks.

THE winter feeding trough for quail, described by Mr. Taft as employed by Massachusetts sportsmen, is a practicable and profitable device, which, for the amount of time and money expended, yields good returns. It should be copied generally, where a food supply in the hard winters means so much in carrying the birds through. Effort directed to saving the native game is much more profitable than attempts to introduce foreign species. Although the imported pheasants have been extensively cultivated, they have not, except in the Northwest, become an appreciable factor of the game supply. New Jersey, New York and Ohio have abandoned the breeding of them. Massachusetts still carries on the work, but the results are not commensurate with the effort put forth, nor is there promise that it will be. On various private estates the birds have been established, at no little cost, and in some instances the country immediately adjacent has shared in the stocking; but here the conditions are local, and probably not permanent.

AFTER a service of nine years as president of the Cuvier Club, of Cincinnati, Mr. Alex. Starbuck has retired on the eve of his eightieth birthday. The term of Mr. Starbuck's office has been a notable period of its history. Under his administration the membership has increased from 180 to 500, and the activities of the organization have been broadened. Vitalized by his energy, the club has become a most important and efficient factor in all good works looking to the protection of birds and game and fish in Ohio. In the Cuvier service President Starbuck was untiring; in furthering its interests he spent more than \$5,000 from his own purse; and it is owing to his enthusiastic, devoted, and untiring labors that the club has won its wide popularity and achieved its enviable position. Mr. Starbuck will be succeeded by Judge P. S. Swing.

THE most characteristic up-to-date hunting expedition is reported from the vicinity of Boston, whence a party of three men and two bird dogs have set out in an automobile for a shooting trip through New Hampshire and into Maine. The touring machine is fitted with beds; the expedition will camp by the roadside where night may fall or fancy dictate; and the dependence upon hotels will be for meals only.

THE SPORTSMAN TOURIST

Inns.

THE subject of inns has always been a fascinating one. There are very few writers of fiction who have not had something to say about it. But we must go back to the old writers—Cervantes, Fielding, Le Sage—to find it treated as it deserves. Who that has dipped into literature does not hold in fond remembrance the inns in which the gallant Don Quixote and his trusty squire, Sancho Panza, sojourned—that is, when they were not sojourning under the roof of heaven; or those in which the rakish Tom Jones pursued his gallantries; or again those in which the ingenious Gil Blas met with so many adventures? Was it the touch of the master hand which made those inns interesting for all time? Perhaps it was. But we may also surmise that they were in themselves intrinsically interesting. Ah, yes! The spirit of romance, of adventure, was still in the world when they or their prototypes existed. That spirit has largely, if not wholly, departed. The railroad, the telegraph and the telephone have been too much for it. We have fallen upon dull, prosaic times, and the average inn of to-day is as tame and uninteresting as a place of business. It is all routine—all machine-like regularity—all stiffness and formality. What man who has lived habitually in hotels has not at times felt himself grow desperate—consumed by the devouring monotony? You never have to puff and labor going upstairs, nor call for hot water or coal and be kept waiting, nor ask for something special to eat and not be able to get it. With melancholy irony it seems that the more the modern hotel has been improved, the less interesting it is to live in. Elevators, electric bells, hot and cold water, telephones, radiators, etc., everything you want, in fact, forthcoming almost before you ask for it—all this has only tended to destroy a man's interest in life, and fill him with an unspeakable ennui.

What shall he do, then? Is there no balm in Gilead? There is, if he will only seek it. Let him, I say, turn sportsman—leaving the fashionable hostelry to the voluptuous or degenerate—and hie him to the little rustic inns in the nooks and corners of the country. There, I warrant, his interest in life will revive, for there he will encounter things which will make him realize that he is not a mere plant or vegetable, but a sentient being.

Let us suppose him, then, taking my advice. Here we find him on a cold, bleak November evening arrived at the Pine Log Inn in Dewville Centre. He has driven ten miles from the railway station, and is shivering like a dog in a wet sack. How grateful and suggestive, therefore, the name of the inn appears to him as he enters. He meets old Noah Noakes, the proprietor, and immediately asks for the fire. "Wal," replies Noah, "I reckon there ain't none except in the kitchen."

"What! No fire in the parlor in such weather as this?"

"Huh! You don't call this weather! Wait 'till the rocks begin to crack, mister."

"Well, I'm chilled almost to death, and I must get warm. Which is the way to the kitchen?"

"I reckon it ain't no use goin' there, as the ole woman is busy about the stove. But, say, mebbe it might do you good to see the pine log."

He leads the way into the parlor and shows the shivering traveler the pine log, beautifully painted to represent leaping flames!

Our friend has received his first delightful shock.

Again we find him at the sign of the Groaning Board in the quail fields of Dixie. He has returned from hunting all day, hungry as famine itself. Dinner being at length announced by the tinkling of a cow bell, he reaches the board in two strides.

"What's this?" he says, addressing the attendant negro boy. "Pork and beans—again?" (He has already had this dish six times in succession.)

"Yaas, suh."

"Anything else?"

"No, suh."

"What! No beef, or mutton, or veal, or turkey, or goose, or 'possum, or dead dog?"

"No, suh—but there's pickles!"

"Well, say—!" And our friend leans back reflectively in his chair with his hands in his pockets.

He has received his second delightful sensation.

Again we find him in midwinter at Hiram Hoag's Cosy Cottage up in Passaquagamay country. He has retired for the night—that is to say, he has made one wild rush from the stove, which he has been hugging all the evening, to his room in the second story. A little 25-cent kerosene lamp casts its dim, religious light about the room and perfumes the atmosphere. Wildly still our friend throws off his clothes, but, ere jumping into bed, he takes up an earthenware pitcher and attempts to pour out a glass of water. The water is frozen! With an exclamation of panic, he then jumps into bed, but no sooner has he pulled the covering over him—to wit, a blanket and a feather "cosy"—than he raises a terrible outcry. This brings Hiram puffing and inquiring to the door.

"More covering—more covering!" shouts our friend.

"Oh-a! Be that all?" quoth Hiram. "You kind o' skeert us. We thought you seed a ghost. Wal, I guess you'll have to mak' aout with the coverin' you've got fer t'night. Marthy's gone to bed and I dassn't disturb her. But you'll be warm enough afore mornin'. Good night."

And so Hiram takes his departure, leaving our friend

to his thoughts. The chattering of his teeth for a while echoes through his chamber, but soon this noise gives place to a measured snore. (Oh, the advantage of a hunter's life when he can go to sleep even under such circumstances!) During the night he is conscious of a rising storm and a crash of some sort, but he does not open his eyes until the dawn. Then in the dim, uncertain light as he surveys the scene from his pillow, he thinks that someone has spread an extra blanket over him while he slept, but presently he discovers that the window has blown in and it has snowed all over him!

He experiences his third delightful sensation.

I might conclude here, for I think I have sufficiently indicated what possibilities of novel sensation there are in the rural inns for the blasé dweller in a fashionable hotel, but I am tempted to mention one more experience of our friend by way of climax.

Once again, then, we find him at the Halcyon Home on the seashore in the season of high tides and early fishing. The Home is erected upon piles, having somewhat the appearance of a man on stilts, and stands alone on a lonely beach. Its rickety build and air of desolation has interested our friend, but why, he asks himself, has it been called the Halcyon Home? He can't answer the question, and he doesn't dare ask the proprietor, who has all the appearance of a pirate retired from business. However, he has come there for fishing, and so long as he gets that he isn't going to bother himself about any abstruse questions of nomenclature.

Well, at 9 o'clock he takes a candle, and ascending a ladder seeks his couch. This he finds is in the form of a bunk, such as the pirate (if he had been one) must have often lain in and naturally selected when he set up his house on shore. Our friend, being now a good deal of a philosopher, turns in without grumbling. But not to sleep. The wind, which has been freshening all the evening, has now assumed the proportions of a gale, and the tide has gradually risen until it is raging around and beneath the Halcyon Home. Our friend is almost deafened with the din, and he is swaying in his bunk almost as if he were on board a ship, but he calmly smokes his pipe and thinks. He is trying, in fact, to resolve that question in regard to the naming of his temporary abode. Suddenly he remembers that "halcyon" is the name the ancient Greeks gave to the kingfisher, which in serene weather built its nest (or was supposed to build it) on the bosom of the ocean; hence, by analogy, halcyon, or happy days, or happy anything. No sooner has our friend remembered this than a fierce gust of wind, accompanied by a tremendous wave, strikes the Halcyon Home and actually raises it off its foundations. Our friend is thrown from his bunk, but he gathers himself up and cries in triumph, his voice rising above the shrieking of the gale:

"I have it—I have it! We are afloat like the kingfisher. It is indeed a halcyon home!"

NEW YORK, October.

FRANCIS MOONAN.

Bird Catching in the Faroe Islands.

BIRD catching as it is carried on in the Faroe Islands may be said to be absolutely unique. On some of the islands it constitutes, even at the present day, a principal source of living for the people. Such, for instance, is the case on Dimurr and on Mikines, where some thirty families dwell; 80,000 puffins besides other birds, and many hundreds of gannets are annually taken.

Of the twenty-four islands of which Faroe consists only those as a rule which have one or more sides facing the open sea possess perpendicular cliffs. Some of these are barren and useless, there being no shelves and ledges upon which the birds can lay their eggs; others are more or less so from having been severely harried. But the real bird cliff swarms with life from top to bottom, and with their grand surroundings and their myriads of inhabitants filling the air they present an attractive spectacle.

Often they assume the most remarkable forms and configurations; and although it does not possess a very large bird population, one of the most extraordinary in this respect is Vestmannabjörg, a spot well worth visiting.

What may be described as real bird cliffs are the precipitous rocks interspersed with steep slopes of greensward, lundaland, as it is called, where the puffins build.

One cannot but admire the daring and courage of the islanders, when, hanging by a rope, they carry on their work on the face of the precipices; and again when, having unfastened the line from the body, they climb from ledge to ledge over intervening spaces where there is barely foothold. To this apparently somewhat foolhardy mode of procedure, however, comparatively few accidents by falling are due, and especially is this the case in connection with *faste*, that is, firm rock, or cliff of a secure character. The *löse* is, of course, less reliable, but the accomplished cragsman, when being let down by the rope, will always note the more uncertain protuberances and stones, and kick them away on his downward progress. Should he not take this precaution, there is always the danger that the friction of the line, after he has passed, may have the effect, and he may be killed by the falling debris. And so when clambering without a rope, he must advance with the

greatest circumspection. An entirely different matter are disruptions arising from natural causes. A portion of rock may be looked upon with suspicion and avoided in consequence, but it may nevertheless remain in its place for hundreds of years; while on the other hand, a mass considered perfectly safe may come away any day without warning.

A few years ago a very extensive slip took place. The rock on the upper part of the bird cliff came away, 150 fathoms from the foot, and fell into the water below with a sound that was heard by the fishermen many miles out at sea. Besides destroying human life, such occurrences cause considerable economic loss to the owners of the bird colonies, as the smooth face of rock which is left cannot again be inhabited. By courage and presence of mind the cragsman overcomes many dangers, but even these qualities cannot protect him against such treacherous surprises, and the most experienced may fall a victim. The loose rock is treacherous enough, but most treacherous of all is the so-called lundaland, which has slipped away into the abyss with many a fine fellow.

On the bird cliffs the grass quickly takes root on the slopes which diverge slightly from the perpendicular, and soil accumulates rapidly around it. When this has attained a certain depth, the puffins come, make their holes and take up their abodes in it. When these have entered into complete possession, the cragsmen come, one or more in company. Quietly they set about their work, capturing one bird after the other by thrusting their arms into the holes, seizing them upon the nests and pulling them forth. This loosens the soil and puts it in motion, and instinctively the men seize hold of the grass; but if the whole mass has been detached, they are hopelessly lost—a whizz through the air and the brave cragsmen have performed their last journey. Again the soil accumulates in the same spot, again come the puffins and build, and again come the cragsmen, and again the same story of disaster and death is repeated. The more uneven such a place and the greater the number of irregularities which it possesses, the better of course is the hold which the soil takes, and the safer the lundaland becomes.

Before describing the various methods of capture, it may be well to examine the bird cliff and its inhabitants. We begin from the foot, where the cormorants, the shags, the black guillemots and the auks sit; only the two last named really belong to the cliff, the others have their nests elsewhere. Ten or fifteen fathoms above the water and upward—well, clear at any rate of the seas, which in summer even in stormy weather never attain the height they do in winter—there are the breeding places of the guillemots, the most important and characteristic of the Faroe cliff birds. They take up their abodes in hundreds of thousands upon the ledges of rock, and there each lays its single egg, with the pretty green ground color and the black spots. The eggs, of which two are never found together, are exactly alike, and according to the cragsmen they are so strong that if one falls sharp end first from the cliff into a boat, it will make a hole in the boat rather than break. The guillemots place their eggs far back on the ledge, close to the perpendicular rock, and they sit with their backs toward the sea, thus presenting the appearance of a black line. The younger and non-breeding individuals on the other hand sit further out on the ledge, facing seaward, and forming a white line. Upon small and narrow shelves amid the guillemot colonies are the breeding places of the kittiwake. It is not much sought after on the real bird cliffs, where it does not occur in such large numbers as on a tract of rock inhabited by this species of gull only. Its edible qualities, moreover, are not good; and it builds singly, which renders its capture troublesome. Neither is it a welcome guest on the bird rock, where it has a tendency to expel the guillemots by taking possession of their breeding places. Then there are the auks, building singly all about the cliff in holes and depressions; along with the guillemots they belong to the black-footed kind, and are not included in the division of the spoil, becoming, according to ancient custom, the property of the individual captor. The fulmar, which is a comparatively new visitor to these parts, as it only put in an appearance about a generation ago, has its breeding places on the upper part of the cliff, which was formerly unoccupied by the other birds, on account, no doubt, of the inconvenience attaching to ascending so high. When the fulmars came they found the lower portions of the rock occupied, and they were therefore obliged to be content with the upper story, so to speak. They are abomination to the original inhabitants, over whom they cast quantities of filthy oily matter to their great discomfort and inconvenience. There would appear to be a continuous immigration of these birds, as, although each lays only one egg, they are increasing rapidly in numbers, and in all likelihood they will shortly dispossess the guillemots to a great extent of their breeding places—to the disgust of the owners of the cliffs.

We now leave the rocky cliff in order to investigate lundaland. It gleams white everywhere, as if strewn with snowballs; and this effect is produced by the white breasts of the puffins that sit there looking out to the sea. Everywhere the greensward is pierced with their holes—furnished most frequently with two openings,

some of them as much as six feet deep. At the bottom of the hole in a nest, constructed of a little dry grass and a few old feathers, the puffin lays its single insignificant looking egg, grayish-white in color. It is about as big as a hen's, although the bird itself is little larger than a pigeon. The guillemots and auks, too, both of which lay on the bare rock without making any attempt at a nest, have comparatively large eggs, about the size of a goose's. The puffin is an interesting bird to watch, with its disproportionately large, black and red striped bill, in which it can, according to the cragsmen, stow away as many as sixty of the small herring on which it feeds its young. These it arranges with the heads inside its bill and the rest hanging out, so that when they come flying home with the thin bodies of the herring fluttering in the wind, they look from a distance as if they wore beards. They can walk with difficulty only. In their gait they resemble a drunken man, or a child that cannot get along without its mother's dress to hold on to; but in this respect they are better than the guillemots, which are even more helpless.

Then there come the shearwaters, which build in the same way as the other puffins, and whose eggs are so like those of the latter that the cragsmen only can distinguish between them. The young ones are very fat and are considered a great delicacy.

How near to death the Faroese cragsmen knows himself to be when engaged in his dangerous employment, appears from the fact that it used to be the custom—and in some places remains so still—for him, before starting on an expedition, to bid farewell to all his friends.

When preparations are being made for such an excursion, which may entail a stay among the cliffs of some fourteen days, it is interesting to observe with what keenness the boys who are going for the first time enter into all the details, seeing carefully to their poles, nets, etc. Where the bird rock is on the same island and not at any very great distance from the village, a boat is not usually employed, but as a rule it is necessary. Among the methods for capturing the sea-fowl, there are three more particularly which may be described; namely, *Drottur*, *Flyging* and *Fygling*. The first of these is employed only in regard to the puffins, and consists simply in taking the birds as they sit on their nests in the deep holes they dig with their sharp claws. Sometimes they are so far in that they cannot be reached, in which case a stick with a hook attached used to be had recourse to; now, however, this cruel method has been given up, and the fowler instead widens the mouth of the hole until he can lay hands on the occupant. When captured the puffins are very savage, and bite and scratch with a will; and the unpracticed hand can generally show a good many scars got in this way.

Flyging is more interesting and distinctly more sporting, the birds being taken when on the wing; and in this connection there are some curious features. While the laying birds are on the nests, the younger guillemots and puffins not thus occupied spend time at sea; but when the eggs have been hatched, they return to the cliff in huge flocks. But this land-coming, as it is called, proceeds in a particular manner as if in accordance with a pre-arranged plan, the birds remaining away and returning upon certain days. While on one day the rock will appear comparatively deserted, only resident birds coming with food for their young and going again, the next it will be swarming with life. It is marvelous to observe what order prevails in this seeming chaos. When a brood strikes the cliff, then flying begins at once; all the thousand upon thousands of birds must out for exercise. No irregularity, however, is permitted; all goes with military precision. If, for instance, the wind came from the east the flighting commences toward the west close along the face of the rock, after which, when the water end has been reached, the birds fly outward, then to the east, in again, and so along the face of the rock once more. The complete circle always progresses in the same direction. If this order were not maintained, incessant collisions would be the result. Occasionally a giddy youngster tries flying in the opposite direction to his fellows, but hardly has he started when he comes into violent contact with one of these, and both fall into the sea. The fulmars are a great nuisance to the circling birds; they seem incapable of discipline. Each rushes about in accordance with its own good will and pleasure; disorder prevails wherever they go, and collisions are frequent in consequence.

As already remarked, the guillemots have their habitations on the rocky cliff itself, while the puffins live upon the other slopes of greensward above that occur here and there upon its face. It is interesting to observe the circle when it comes to the line of demarkation between these two kinds of birds. Looking up to and toward the advancing puffins, it appears as if a sea of snowballs were coming on, and the rapid wing strokes only dispel the illusion; but seen from behind there is no trace of white and a black cloud only is visible. Looking down on the gyrating guillemots, nothing but dark forms are to be seen, the black backs only being apparent.

Throughout the performance single birds may be observed leaving the main body in order to rest on the rock, rejoining the circle after a brief space. It is when the birds thus flight that the method of capture, known as *flyging*, yields good results and becomes interesting. With the assistance of a net attached to two arms at the end of a twelve-foot pole the fowler takes the birds as, in the course of their circular journey, they pass close to the cliff; and in this manner it is no difficult matter for a single cragsman to capture from 500 to 600 birds in a day, while as many as a thousand have been thus taken.

The third method of capture, called *fyglingar*, is employed only for guillemots and auks. The instrument used resembles the one above referred to, but the pole is shorter and thicker, and the net is bigger and has larger meshes. To *fygla* is to capture the guillemot either while sitting upon its ledge, or when it flies from thence, by holding the net at the outer edge. The Faroese bird cliffs average from 800 to 1,000 feet, and

in some cases they attain a height of 2,000 feet. In connection with the method last referred to the "bjerg line" is invariably used, and to swing by this in mid-air on the face of a precipice swarming with the birds, and with a thundering surf underneath, is the ambition of every plucky Faroese boy. To see an accomplished cragsman swing himself in on to one of the terraces beneath some huge overhanging mass, when the line has been paid out some 120 fathoms or more, is a wonderful sight. With the mighty precipice overhead, and the roar of the turbulent waters beneath, surrounded by thousands of birds all uttering their wild cries, he swings in toward the rock and out again, without once revolving, until he can reach and throw himself on to the ledge. When he has obtained foothold, he gives his companions on the edge of the cliff above notice to ease off by jerking at the thin cord which connects him with them; then he detaches the rope from his body, hauls in a lot of slack, and makes the end fast. After that he sets to work upon the ledge, which is often very narrow and contracted. Time after time the rut is filled with birds, and both hands not being always available to apply the fatal squeeze, his teeth sometimes come in handy. If the weather permit, a boat lies beneath ready to pick up the victims as they are thrown over, or the cragsman attaches them to his person, and takes them with him when he leaves. When ready to ascend he gives another jerk or two to the thin cord; a few pulls from above and the rope is drawn tight; another, and the cragsman is again swinging out in mid-air on his way to the brink of the precipice above.

As an example of the foolhardiness which is sometimes shown by the bird catchers, the following may be told: A cragsman had swung off, had landed upon a ledge, and was busily employed with his net, when, to his horror, he saw the rope, his only means of escape, hanging out beyond the reach of his pole; by some mischance his end had become detached. After a moment's thought he concluded to chance it, bounded off the ledge, and was fortunate enough to regain hold of the rope; up this he swarmed until he reached the face of the cliff, by thrusting his feet against which he obtained the impetus necessary for swinging; then he descended again, and finally succeeded in re-landing on the ledge!

To ascend the high isolated rocks, both daring and dexterity are needful. Two men, attached to one another by a rope, share the labor and danger. The first who goes up is assisted by his companion, who thrusts the end of his pole into his belt; when he has attained foothold, he helps up the second man with the line. In a similar manner the next ledge is attained, and so, climbing higher and higher, they take the birds on either side. This method, however, is a dangerous one, and it has happened several times that both men have fallen over, being fastened together.

As the population of the islands increases and extends, the inhabitants of the cliffs diminish in numbers; and although the use of fire-arms within a couple of miles of one of the latter is forbidden by law, the birds have become more shy and difficult to take. Although slowly, the guillemots are steadily decreasing; but the shearwaters, which for a long time were falling off, are again on the increase, as the result of a more careful method of capture.

It is said that in some places the puffins are not so numerous as they used to be; but as a matter of fact, by making holes in places formerly inhabited by them, they have been induced to come in large numbers. The kittiwakes, of which quantities used to be shot from the fishing boats for bait, will no doubt recover, as, thanks to the ice houses, there is always plenty of herring now to be had for that purpose. The fulmars, as already stated, are increasing rapidly in numbers, at the expense, unfortunately, of more valuable fowl.

Bird catching, however, is not of the same consequence to the inhabitants of Faroe as it used to be—not so much on account of the falling off of the stock of fowl, as in the improvement in other means of livelihood. Thus the fishing, which has of late years made great strides, employs nearly all the men and yields excellent results; the fleet consists now of about 100 cutters, with crews amounting to 1,200 men, and 1,500 open boats with crews of 2,000 men. Nevertheless, a very large number of birds are still captured annually, and, as before remarked, they constitute on some of the islands a highly important article of food.

A Veteran Oak.

Editor *Forest and Stream*:

A gigantic white oak stands on Oakledge Tract, some sixty yards north of the "Bresh Hut," the cabin of which a description has been given in *FOREST AND STREAM*. The tree is one of the largest in northeastern Connecticut. It is 15 feet around the trunk, with branches extending nearly a hundred feet, and the whole tree is "as sound as a nut." As it has a very heavy leafage every year, thus giving a perfect shade, and many of the branches spreading very low, it makes a capital place for hammocks, which can be easily suspended, and also for swings on one side where the branches are higher.

The tree must be several hundred years old, as I have not seen any perceptible difference in its growth since my boyhood; and I remember then hearing some very aged people say that when they were children, the tree seemingly was but a little smaller. So in the whole time covering considerably more than a century, there has not been apparently any great difference in its size. Truly it is a magnificent tree; and at this time, when about all of the old forest growth and nearly every large scattering tree in the well settled parts of the Eastern States have been cut off, with nothing left but a few ill-shaped and inferior looking ones, or a growth of sprouts and bushes, a well formed tree of the huge dimensions of this one is a pleasing sight to everyone, and especially to a true lover of nature.

Many of the neighboring people have picnics beneath its branches. Last Fourth of July about a dozen fellow sportsmen, with their families—in all forty or more persons, including myself and daughter—had a "big eat" there. Most of the food was prepared in the big roughly built oven near the old oak. Then the whole party sat down to the feast under the widespread branches.

During the day several tried their skill at both rifle and trapshooting, as I have a 100-yard range near the oak for rifle practice; also bluerock traps for the use of my sportsmen friends, as well as for my own.

Speaking of shooting, there is plenty of game on the tract—partridges, quail, rabbits, and gray squirrels; also last fall two fawns were seen near the "Bresh" by different persons at several different times.

A. L. L.

Denuding the Mountains.

Editor *Forest and Stream*:

Indignation has been burning within me these many years, and the flame has been fanned to increasing heat by the article in October 1 issue on "Denuding the Mountains," by A. D. McCandless. Having been for some years a resident of the mountain regions of Colorado and Wyoming, I have tried to study the situation as it has been, and now is, in regard to the destruction of timber on Government lands.

Like Mr. McCandless, I am not familiar with the laws governing such operations, but I am sure that one of three things is a fact—either the makers of the laws controlling Government timber lands are ignorant of the results which must follow the removal of the timber which has been and is being removed, or they have caused such laws to exist because of some personal advantage, and regardless of the general public good, or else this timber is being removed contrary to existing laws.

The public press is supposed to voice the sentiment of the people, and to it we look to cry out against a public wrong, and yet in some of the very districts where this devastation is going on the papers are loud in their approval of that which they choose to call industries which bring money and prosperity into their districts.

They speak of the business sagacity of the men who conceived the idea of despoiling the mountains of their timber, of the increased demand for hay to feed the horses used in hauling out the timber, and the employment given to men in cutting and floating the timber out of the country, but not one word do we see in these same papers about the probable condition of the country a few years hence.

It might well be likened to a man who takes into his system strong and injurious stimulants for the purpose of creating an abnormal activity of mind or body in order that he may do work beyond his capacity, without considering the reduced condition of his forces which must follow such a course. The section of country to which I refer particularly is northern Colorado and southern Wyoming, and the papers of the towns of Saratoga and Encampment, Wyo., and Pearl, Colo., are the organs which should be, and are not, sounding the warning note.

The agriculture of these sections is entirely dependent upon irrigation, and in the past a great abundance of water has come down from these grand old wooded mountains during all the irrigating season.

Until a few years ago all the timber was standing untouched on the great slopes which furnish the water to the Platte River and its tributaries, but now the tie choppers are at work by the hundreds, and timber is being cut even down to mining props; then after that, the fire; and last, unless I may fortunately be wrong in my prediction, will come the desolation which a lack of water would inevitably bring.

No spot on this great earth is so dear to me as that mountain country referred to, and it may be because of an undue love for the woods themselves, rather than the good purposes they serve in conserving the water supply, that I am jealous of their destruction; but surely the few paltry dollars which our great Government gets from the sale of such timber cannot justify the converting of these beautiful wooded mountains, the sight of which is a joy, into barren wastes, the sight of which would make any lover of nature want to get out of the country.

Of course there are saw mills in these mountains also, but the lumber obtained is used in the building up and improvement of the immediate neighborhood from which it is taken, and should not be condemned; but the great destruction, to which it is hard to become reconciled, is that of taking off the timber and floating it out to the railroad for shipment. When I think of the great silent wooded mountains where I pitched my tent in years gone by, where not a sight nor sound indicated the presence of civilized man, and then read of the throng of men laying waste the silent places, which seemed almost too sacred to mar by even chopping wood for the camp-fire, I think, "What will not man do for gain in dollars?" With Mr. McCandless, I would raise my voice against this destruction, and hope that the citizens and ranch owners of the localities named especially may realize the importance of the woods to their future welfare, and work as one man for the suppression of their destruction, while there may yet remain enough to hold their water supply.

MORGANTOWN, W. Va.

EMERSON CARNEY.

Flying Squirrels in Mexico.

In 1651 Hernandez recorded the presence of flying squirrels in Mexico. The next record south of the United States was in 1861, when Tones included it in his list of mammals taken by Salvin at Dueñas, Guatemala (P. Z. S., 1861, p. 281). In 1892 I saw a pair of mounted specimens in the museum of the State College at the city of San Luis Potosi. These were recorded as having been taken near Jilitla, in San Luis Potosi. During all of our subsequent work in Mexico, until the present season, whenever in suitable country, both Goldman and I have kept a constant but unsuccessful lookout for these animals. During April, 1904, while in the high lands of Chiapas, near the Guatemala border, Goldman was fortunate enough to secure a good pair of adult flying squirrels with skulls. In view of the striking differences between the Mexican and United States species of *Sciurus* it was a great surprise to find this isolated representative of *Sciuropterus* very closely related to forms found in the United States.—E. W. Nelson in Proceedings Biological Society of Washington.

All the game laws and fish laws of the United States and Canada are given in the "Game Laws in Brief."

NATURAL HISTORY

Some Animals I Have Studied.

XI.—Birds with Odd Characters.

Not only does the hen possess an eloquent language, but she is quick to learn the signification of many sounds among her near associates, both biped and quadruped, and especially the most familiar human words. On the farm the greedy creature eagerly comes whenever any other grain-eating animal is called, no matter what sound is used. Any noise that is used to signal the hogs, cattle or horses, or any loud din that habitually accompanies their feeding, is soon learned by this truly versatile bird. And she eventually loses all fear of any animal with which she is daily associated. A good dog finds that after a time he can no longer drive her away from the hogs without actual injury to her; she can't be "bluffed," and he quits in unmistakable disgust. Literally, to the hen, does "familiarity breed contempt." She will poke her head into a hog's mouth after the corn he is chewing, unless he tosses her aside with his snout; and if he happens to be a habitual "chicken eater" and has just beheld one, she will still defy him, after cackling a little at the other hen's flapping. She would do the same with a lion, and also with the largest owl, hawk or eagle, if it had been walking about on the ground before her, day after day, for a week. After numerous retreats from a vigorous dog (who may be such a good actor that even a man—if a stranger—would feel sure he meant to demolish the hen), she concludes that surrender is better than flight, so she will simply sit down and humbly wait to be seized, instead of wildly flying. If some nervous woman is near and scolds the dog for "mussing" the hen at this juncture—though she, perhaps, had previously ordered him to drive the hen—he will likely sneak off and refuse thereafter to have anything to do with hens—at least unless in the effort to please some other person. That woman will have lost his respect, if he is a proud dog, and great care will be needed to win it back.

The right way is never to ask a dog to drive any animal that is likely either to resist or balk, unless you are willing to allow him to conquer the culprit at any cost. For the sake of his future usefulness, and for your own self-respect, never allow any brute to conquer him when he is serving you.

But the hen is remarkable in other ways than merely learning sounds. While at times one of the most greedy, heedless and unrestrained of all things, she can be taught just the opposite qualities. She may be easily trained to affect an utter disregard for food; to appear patient and submissive; and to exhibit a degree of self-control that might well shame man or dog. All this, too, while in perfect health. When a boy I had a fat, lively hen so educated that at my bidding she would lie on her back and slide head first down an inclined plane two or three feet in length without the slightest effort to turn upright or stop herself; and at the bottom she would remain just as she landed until I touched her or spoke to her—unless interfered with by some other person or animal. Incredible as this may seem, it is a trick easily taught any gentle, affectionate hen. I taught her to submit to many postures that hens naturally object to—such as balancing on her back, on the top of a slender post, and remaining so until disturbed or removed, or being "buried alive," all but her head, in any position I wished. Be it understood, she did not place herself in any of these positions, but merely submitted to being so placed.

I taught a duck to roost on a platform high above the ground (eight or nine feet) with an old hen and a few grown turkeys. But an even more remarkable thing was that the old hen would not permit the turkeys to fight the duck, though any one of those large birds could have conquered her and the duck combined. It was simply a case of respect for parental authority—"Old Muff" had been "the only mother they ever knew."

Two of the same turkeys were trained to perch quietly on a slender cross-piece at the top of a tall pole while I carried it around, or juggled with it. One of them was gray, the other yellow. If I dropped a red handkerchief on the ground, the yellow one would dart down and tramp and toss it about in an apparent frenzy of rage for a long while. The other would merely look on in mild surprise, or come calmly down and stand by idly.

I once brought home a strange gobbler, a large old fellow. When I dropped him, our old rooster gave a scream of rage and hurled himself at me! Although a man "and a voter," I had to exert myself not a little in self-defense with fist and foot. I never found out the cause of his attack, nor what he was mad about; but I did find, afterward, that a bond of union had been formed between the two haughty birds, for whoever touched either was compelled to defend himself immediately from a savage attack by the other, or run away.

I once knew two young roosters who formed a regular "David and Jonathan" attachment for each other which continued unbroken all their lives. If there was ever a blow or a cross word between 'em, I never knew of it. Nor did I ever see or hear of any bird treating another with such polite consideration as they constantly showed each other. Indeed, their mutual favorings were excessive—they were the "Alphonse and Gaston" of birddom.

Only one other case within my knowledge at all approaches this. A couple of chicks of opposite sexes, when about the size of quail, formed such a romantic, and at the same time platonic, regard for each other that they withdrew not only from their own family, but from all other birds, and, without showing fear of any, carefully avoided all. I don't think I ever saw them twenty feet apart while they both lived. They did not stray far away nor become wild, but behaved as if they each desired no other society. They sought the most secluded and unpopular resorts, gathered bugs and berries, and were

happy. Their favorite bower was a tiny hazel grove near the shingle mill; but if they saw other birds wandering thitherward, they got up and strolled further. They were both very beautiful, very quiet and dignified, very gentle; with soft, loving voices, expressive eyes, and altogether charming manners. But one day, when they were nearly mature size, a hawk swooped down among the hazels and caught the male bird. The hen, in her uncontrollable fear, fled. But love was powerful, and soon drew her back. Something had driven the enemy away, and he had left most of her friend's body, or else he had set a trap for her, so that he might claim her also. Now, if she had been an ordinary chicken, she would have begun to eat her dead companion without any compunction. But instead she screamed with horror, and when I went down there, taking along my .22 rifle, she was slowly walking round and round the silent remains, calling out to him in the most pitiable tones of grief I ever thought it possible for any bird to utter. She paid little attention to me or to my heartfelt words of sympathy, but continued her walkings and lamentations.

Hoping the hawk might come again at once (I didn't know much about hawks then), I left the dead bird and the living one, and retired some distance to watch for it as long as my patience and other duties would permit. Needless to say, my vigilance was in vain. For several days I visited the spot, filled with a wicked desire toward that hawk, or any other that might come near. Every day I saw the little hen, wandering sad and alone in the vicinity, and listened to her plaintive voice, much like a young girl's whose vocal organs are changing, until I was too much wrought upon to bear it longer. She now gave no heed to any bird flying over, no matter how large, and refused all food. I feared she desired to die—if a bird ever thinks of death—or to have the same destroyer of her loved brother take her also away. If so, fate must have turned kind to her, for she suddenly disappeared, and I saw her no more. I found a bunch of her exceedingly beautiful feathers near her friend's—that was all.

The wild turkey mentioned in a former chapter deserves mention here, not merely because he was a peacemaker, but for other reasons. He became more affectionate toward me than any of our tame ones ever did, although he would never allow me to handle him. As I once remarked to a visitor who was admiring him, "He's like the average pet deer—it's all right for him to touch me anywhere, any time; but I musn't touch him." He would eat out of my hand, and did so to the last, though he grew to be a great, independent gobbler, and leader of the flock. And wherever I slept, as soon as he found it out, he would soar up to the roof, as nearly over me as possible. This was more remarkable than at first appears, for I slept on porches wherever I thought I could get the best air, winter or summer, and in different rooms; and while he remained with us we built a new house in the yard and moved into it, and again he flew to the roof of my bedroom. If I went out, even at midnight, and the darkest midnight, and spoke to him ("Hello, Turk!" being my usual greeting), he would reply, either with a plaintive chirp or a most startling gobble. He went to roost much later than the other birds, and often frightened them into an unearthly uproar by sailing majestically out of the woods in the gathering gloom of night, perhaps at a great height, and coming down violently with his great weight upon the side of the roof, causing a thump that could have been heard an eighth of a mile. He generally struck the chicken-house first, removing a few minutes later to the roof over my bed, no matter where that might be. It was a thrilling sight to see him flying, he looked so large and magnificent, yet moved as swiftly and gracefully as a partridge. Unlike most game birds, he never seemed to tire of flying. I believe he could have flown ten miles without a rest. And his strength of wing was prodigious. Now that there are "myth-busters" who deny that any eagle ever carried off a child, and declare that no eagle could do so, let me tempt their ridicule by saying that this turkey once came very near flying away with me, and with one wing handicapped, too, and my weight varies from 150 to 165 pounds; a little greater than the average weight of a small child!

We had, early in his life, tied a strip of bright red flannel around the scapular part of one wing to cause him to be a little less likely to fall a victim to the heedless, hasty hunter; but the feathers had at last grown over so as to entirely conceal his "safety badge" most of the time; and he kept ranging further and further away, though he still came home every night, and always flew straight home when frightened by hounds or hunters. We frequently got reports of his being seen a mile or more from home. So, being anxious about him now, I resolved to catch him and rearrange his badge, adding another ribbon to it. He was valuable and worth taking trouble to preserve, for, in addition to giving strength and vigor to our domestic flock, he caused divers of the wild turkeys to stray within gunshot of Uncle Tom—my father-in-law, who is an unquenchable sportsman, but never a pot-hunter, let me add.

Turk came and ate from my hand, as usual, but seemed suspicious, for he kept his neck stretched and stood back as far as possible, and kept watching my eye as a trained boxer might. No living thing is more alert than the wild turkeys of this region. Seeing there wasn't the ghost of a chance to seize a leg, I suddenly threw myself bodily upon him, and snatched the scapular joint of the nearer wing just as he turned to fly. There was a very large, heavy gate right between him and the woods. The gate was 16 feet long and 6 feet or more in height. There was a jump and a wild flutter, and in a moment I let go—perhaps to save my face from being beaten to a jelly—and dropped right across the sharp top of that gate on my ribs. Oo-oo-oo! I can almost feel it yet, though it happened five or six years ago. Turk flew across the road

into the bushes, but as soon as I could recover sufficiently to call him, he returned, looking as if he thought I had entangled with him by accident. But I never caught him, and when he was about two years old the long-feared thing came to pass—a hunter shot him, and was honest enough to own to it, though he would never have known him to be other than legitimate prey had he not found the badge, which he did, of course, after it was too late.

None of Turk's descendants were ever as tame or intelligent as he; yet one—a gobbler of the third generation—was even more remarkable in one respect. He was as cross and selfish as his grandsire was gentle and chivalrous. Our turkeys and chickens always ran out mornings and evenings to wrestle with the hogs when the latter were fed. In the confusion and struggling one would have doubted the ability of any bird to escape alive. The turkeys, however, were more cunning and cautious than even a wild chicken. Instead of dashing into the midst of the herd, as did the chickens, they would dodge warily around the outer edges, snatching up a stray grain here and there, until the gobbler would at last grab a whole ear—he'd always take the largest he could find—and run with it. He would rush down toward the brook, followed by all the turkeys. He would double here, and dodge there, for a time, until most of his pursuers had despaired. Two or three old hens, however, would usually keep up the chase until they reached the stream. This was done, with but slight variations, once or twice every day. Once I followed the very last and most determined of the gobbler's pursuers. The brook is about 100 yards south of the corner. Now, a turkey is not considered a water fowl. But that gobbler waded into the shallow water (it was at the ford), holding the big ear of corn as high as he could stretch his neck. I supposed he intended to cross; but, while the other turkeys hesitated, he laid the ear down in the water and began picking at it. It floated away, although his mighty blows retarded it somewhat, sending it to the bottom every time. Sometimes his huge head went under with it, but he cared no more for that than a duck might, or at any rate showed no sign of chagrin. The hens then waded in and grabbed at the elusive prize. He caught it up and went rapidly down stream toward deeper water. They followed until it was deep enough to wet their breasts, then stopped, dismayed. Deeper, deeper went the gobbler, until the ear was dropped in a swift current which quickly hurled it into a corner of a comparatively calm pool. Here he stood, in water almost over his back (deep enough for a small boy to swim in), and calmly pecked away at the bobbing ear, apparently as unconcerned as if alone and on dry ground. It was an amazing spectacle, and at the same time a comical one. How long it lasted I cannot tell, but too long for me to see the end.

[TO BE CONTINUED.]

Insect Tenacity of Life.

LITTLE ROCK, Ark., July 23.—*Editor Forest and Stream:* I was very much interested in an article in a recent issue on the tenacity of insect life. I have often noticed the same thing. Some experiments on wasps which I once made, however, led to results which were surprising, and, to say the least, anomalous. Mr. Chapman says that he was surprised to see that the insect did not die when he cut it in two between the thorax and abdomen. I experienced the same surprise once, but I determined to see how far the thing could be carried. There was a wasp's nest just outside my window and a number of wasps were usually in the room. One day I cut one of them in two at the waist. This small loss did not seem to worry the wasp at all. He fluttered against the window pane just as he did before. This surprised me so much that I wanted to see how long one would live thus. There were a number of them on the window, and I severed them all. After the operation both halves of the wasp were still alive. The head, thorax, and wings flew about just as the insect had; only the flight was manifestly weaker. The next day this fore part of all of them was still able to walk, and most of them to fly. On the second day about half of them were dead, and but few of them lived till the third day, although a few of them were able to crawl then. The abdomens of the insects showed unmistakable signs of life after being cut off for several hours. This was manifested in the movement of the sting. Now for the most remarkable result of these crude experiments. Although the wasps would live when cut at the point of articulation of abdomen and thorax, if they were cut in two further back—i. e., if the abdomen were cut in two, the animal died instantly. Can anyone explain why? I once asked a professor of biology about it, but he was unable to explain; in fact, the phenomena was unknown to him till I told him of it. Now, obviously, there is nothing in the abdomen so vital to the life of the insect, because the whole thing can be cut off. Why, then, can it not be cut in two? Does it die of pain or nervous shock?

LEWIS H. ROSE.

A Snake-Hunting Dog.

MR. L. R. MORPHEW's story of "Coallie, the Snake Dog," reminds me of Lulu, who was my constant companion for about six weeks two years ago in Florida. She was a cross between the fox terrier and pug. She would hunt for and find snakes much as a good setter would find quail. She killed all she found, till, much to the disgust of my friends who owned chickens, I told her she musn't. I have the skin of a 6-foot chicken snake which she detained for me till I took it with a forked stick. She one day, at my command, held at bay by barking, a 9-foot king snake for about half an hour, till I had studied it all I wished, and called her off. Much to my regret, I learned that she was recently bitten by a rattler and died.

MARK E. NOBLE.

GAME BAG AND GUN

Red Letter Days with the Deer.

BY HORACE KENT TENNEY.

I do not know the origin of the expression "red letter days," nor whether it really implies that certain days are rubricated on the pages of memory like some of those delightful old vellum books over which the monks used to work with the pen of nature's providing in the exercise of an art which was truly "scriptural." The old fellows who made the rubrics certainly had no "red letter days," as we understand the expression. Theirs were days of quiet monotony passed apart from the world—

"Where storied windows, richly dight,
Let in a dim, religious light;"

and where time was marked by a round of duties from lauds to matins, and from matins to lauds. Perhaps they colored a little more brightly the initials of the songs for festival days, but they could not give the color of the page to the day itself, nor find in the dull round of monastic routine the counterpart of those glowing days which come to the Disciple of the Out of Doors. For to those who

"Hear the call, good hunting all,"

the Red Gods bring now and then days the color of whose illuminations is never fading.

These days are not always—and most happily is this so—those which, tested by the weight of creel or game bag, are most successful. But there are many who know and assert that the successful sportsman is not alone he who at the end of the day can show fur, feather or fin. And I am the more anxious to support this doctrine, as without it I cannot hope to be classed with the successful hunters. But it does sometimes happen that success in its most material form attends the efforts of the hunter whose game bag is habitually as light as his heart. It is of such a day that I write.

The time was in the open season of November, when the deer hunter can say—

"Here is no law in good green shaw,"

and can carry a rifle with a clear conscience. The place is immaterial, though it is perhaps proper to say that the broad expanse of Lake Superior, all blue and white like a Delft tile, lay only a few hundred yards to the north of the cabin where we spent the hours between dark and dawn. The day—from a still-hunter's standpoint—left everything to be desired. There was no snow, the woods were dry, so that everything crackled under foot and against the sides of your legs, and heralded your progress like that of "an army with banners." And there was the wind—not a steady, straight-blowing breeze, whose course you could note and make it an aid in your lethal purpose; but a lusty, gusty tempest, which came and went from all quarters at once and whirled around in such varying courses that if a deer was to avoid scenting you, he would have to be very lively about it, and spend most of his time running in a circle.

I had been out at daybreak and hunted industriously along an old logging road which ran—or would you say lumbered—through the woods along the course of a small inland lake. It was a fine place for deer, was that road, and the deer knew it as well as we did. It went straight into the heart of the forest, was far enough from the lake shore to leave good cover between it and the water, was wholly deserted, and scattered along it were numerous small choppings abounding in grass and "browse." To the north of it in the two-mile stretch to Lake Superior was good ranging ground, a true forest according to the definition which dear old John Manwood wrote in 1615 in his "Forest Laws":

A Forest is a certain Territorie of woody grounds and fruitful pastures, priviledged for wild beasts and fowles of Forest, Chase and Warren, to rest and abide in, in the safe protection of the King, for his princely delight and pleasure, which Territorie of ground so priviledged, is meered and bounded with unremovable marks, meeres and boundaries either known by matter of record or by prescription; and also replenished by wilde beasts of venerie or chase, and with great covertes of Vert for the succour of the said wilde beasts to have their abode in."

Into this "Territorie of woody ground" I entered with a stealthy step and a .38-55 Winchester, when the tree-tops were beginning to brighten with that pervading suggestion of light which is seen only at dawn. When the sun was throwing his long javelins of light between the trunks of the Norways I emerged at the other end, without having seen anything but a glimpse of a flashing white tail which reminded me of Burns' line—

"Like the snowfall in the river,
A moment white—then melts forever."

Probably some mighty still-hunter will say, "If the woods were noisy you ought to have sat on a log and watched." Well, I have done that in my time, and—but that is another story.

So I went back to breakfast. This sounds like a commonplace statement of a very ordinary event, and suggests the idea of pork and potatoes served from a rusty frying pan and accompanied by that mess of hell-broth which the lumbering jack has been schooled to regard as coffee. But the fact was far otherwise. Our breakfasts and dinners were cooked by one who understood all the niceties of that noble art, and they appealed and ministered to the higher and better parts of our nature.

It was our custom—and I commend it to others—to hunt from dawn until about nine o'clock; then return for breakfast, and after a slight interval of profitable idleness take to the woods again and hunt until dark, dining late in the evening. By this method we economized time when hunting was best, and took our meals in ease and comfort.

In pursuance of this custom I started off in the middle

of the morning intending to scout around some likely ground lying east of the camp, find a good place and watch during the latter part of the day. The wind was still of the eccentric and concentric character which I have described, and the time of day, the impossibility of moving quietly, and all the circumstances were so unfavorable that I had very little idea of seeing a deer, much less of getting a shot, though feeling pretty sure that several would probably see and hear me. So I proceeded somewhat carelessly. (*Nota bene:* Never proceed somewhat carelessly; act as if you knew he was there all the time.) A mile or so of walking or strolling brought me to the end of a wide open space, which fronted on the big lake. On the south side of this was a jack pine thicket with an old road leading into it. Partly to get out of the wind and into the shelter of the jack pines, I took this road, which, as it left the clearing, went up the side of a short ridge. As I started up the slope it occurred to me that the hunting rules laid down by Mr. Van Dyke required that I should crawl up to the top and peek over the ridge and not stalk up like a grenadier on a forlorn hope. I was about to follow this course when a beautiful pair of horns seemed suddenly to grow out of the top of the ridge. They remained there motionless, with nothing else showing, and looking very much as if they were stuck in the sand. I realized that the buck and I were in about the same physical and mental situation: He could see enough of my cap to wonder what on earth it was, and I could see enough of his horns to make me wish he would raise his head about two inches. But he would not do it, and fearing that he would jump into the jack pines before I could "rush" him, I did a very foolish thing. The top of the ridge seemed to be pine needles and light stuff through which a ball would pass without serious deflection, so I figured that there was a chance of shooting through it, and taking him at the base of the horns. Well, I tried it. The pine needles flew into the air, the horns disappeared, and when I reached the ridge, which required only about three jumps, the buck was at the latter end of a beautiful leap which took him out of sight. Then I sat down and berated myself soundly for my carelessness, and vowed always to hunt, as the Spaniards say, "with beard on shoulder."

After waiting for things to quiet down a bit, I started ahead, keeping that preternaturally sharp lookout which comes with the freshness of a good resolution. The road dipped down into a sort of amphitheater, with a steep hill on the opposite side, covered with thick second growth. A suspicious appearance in a maple thicket near the top of the hill made me stop, and I soon made out the outline of a doe's head and shoulders. The situation did not require any tangent firing, and I dropped her in her tracks the first shot.

This revived my spirits, which had been a good deal depressed by the incident of the horns on the ridge. I slid the doe down the hill to the roadway, where the team could reach her, and pushed on with fresh energy and an increased confidence in my ability to encompass the death of any deer who would give me half a chance. I started for the place where I had seen the buck's tail patterned against the underbrush, hoping for a chance to line the ivory sight upon some portion of his framework, instead of shooting by calculation at a place where he wasn't.

A few steps brought me through the jackpines to a large plain which had been burned over about a year before, and there, under a tree a couple of hundred yards away, stood the biggest buck I expect to see this side of the happy hunting grounds. Of course all the bucks you see alone are big fellows, but this was really one of nature's noblemen. He stood up like the traditional buck on an old powder flask, or like one of Landseer's stags, thick-necked, with wide, branching antlers. He was watching me in a stolid sort of fashion, not seeming half as interested as I was, but I realized that he was not a permanent fixture in the landscape, and that it behooved me to act quickly. So I drew for his shoulder, and cut loose. He gave a sort of lurch, whirled and jumped behind some fallen tree-tops, reappeared on the other side, headed for the sheltering jackpines and going like a torpedo boat. I pumped in another shot without apparent effect, and he was soon out of sight.

The ground where he stood was covered with ashes, and I could find no blood, and I could not tell whether he was wounded or not. It was useless to follow him, so I went back out of sight and waited the better part of an hour and then started to circle around the edge of the plain. Before long I jumped him in some poplars, and then into a brief minute was crowded all the emotions and experiences which I had imagined since I read "Deer-slayer" as a boy. The exact order of events is not clear in my mind even now. I know only that he started like a whirlwind; that I had him down at the second shot; that he got up and I knocked him over four times, each shot on the jump; that when it was over and his antlers were on the ground, I uncovered,

"Took with forehead bare,
The benediction of the air,"

and rejoiced aloud. For had I not killed a masterful buck, and killed him on the run?

Truly that day was one to be marked with rubrics.

As I sit by the fire-place on this day in February I can see the buck's head hanging on the wall. But I can also see the jackpine thicket and hear the wind from off Superior roaring in the tree-tops.

Another day well worthy of the place which it holds in memory, may be called a red letter day, although its dominant color was white. We were in the same belt of

woodland, and had been hunting about ten days. Rarely, indeed, do the fallen sons of Adam receive the blessing of such weather as we enjoyed on that trip. The temperature was just right. Not the

"Dull, hard bitterness of cold,
That checked mid-vein the quickened race
Of life-blood in the sharpened face;"

but the keen-edged air which keys a man up to the full enjoyment of all that it brings to him. And over all was the glory of the snow. It fell every night; and each morning when we stepped out in the quiet starlight, the tracks of yesterday were obliterated, and we knew that every trace and track we saw was only a few hours old. To one whose skill in woodcraft is not equal to following the trail of a serpent on a rock, it brings a great and abiding sense of comfort to know, when he finds a track, that it is not prehistoric. We had made good use of the advantage thus given us, and had a respectable show of bucks and does hanging up in that outstretched attitude which a deer exhibits when hung up by the gambrel joints. This gave us a placid feeling of contentment; for we knew that our stay-at-home friends could not rail at us as unskillful hunters, nor the envious critic assert that we had exceeded the limits of fair sport. And with this feeling we began to range the woods in rather a careless fashion, by the strict code of the still-hunter, keeping together that we might enjoy together our love of the woods, whose beauty was changing and increasing with each new fall of snow. Our enjoyment was the keener that it was our first experience with heavy snow in the deep woods, though I am sure that for each of us

"Age cannot wither, nor custom stale its infinite variety."

As the end of our stay drew near, there was about ten inches of snow on the ground, and to be sure of getting the full enjoyment of it, we decided to leave the snug cabin where we were housed and spend our last night in the woods. There was underlying this plan a sort of pretense that by camping near a famous runway some three miles from the cabin we would have a better chance of securing a mighty buck. But we both understood that the real purpose was the fun of building the camp, and I think that a buck—unless perhaps he was "a stag of ten"—could have walked past our fire with impunity.

We rolled up our blankets and a small assortment of provisions and utensils which I venture to think would not have provoked a derisive sniff from old Nessmuk himself. For shelter we took the fly of my Protean tent. (Those who do not know the Protean tent, made by a genius in Evanston, Ill., have lost much of the joy which this life holds for the initiated.) With the assistance of a tall Swede, whose courtesy was severely strained in keeping back the explosive expression of his opinion of our plan, we transported the outfit to the selected spot, and set to work making a local habitation.

The spot which we had chosen was specially adapted to the purposes of a small camp. Indeed, the silent forces of nature had evidently been working for ages with a view to that final consummation. It was in a wide, high valley which ran along between the shore of a lake and the shoulder of a hill which would have been a mountain if it had been large enough. A trail led through the valley from the lake to a rocky spur which was well called by the descriptive name of The Fortress; from there it went onward to yet other regions of delight. Criss-crossing the trail about a mile from the lake was a little runlet not large enough to brawl noisily over its stones, but just large enough to make a sort of subdued "sussurus," which was clearly for the exclusive benefit of the man who slept with his ear to the ground.

A little to one side of this rill was an out-cropping of rock, one side of which was straight and about four feet high—a ready-made back for a woodland fire-place. Opposite this, and at a distance nicely calculated to be within proper range of the firing line, we cleared away the snow to make a place for the tent. This tent was a small affair, seven feet square on the ground, open toward the fire, and tapering up from three sides to the top of the single pole which supported it. With the snow banked up around the bottom it blended in with the general white of the landscape, seeming a part of the wilderness, and not an outpost of civilization.

The setting of the tent was a small matter, and soon accomplished, but the building of the fire was one of more serious moment, involving not only the use of ax and muscle, but a nice and judicious discrimination in the choice of wood and the arrangement of logs. For this was to be not a little "friendship fire," nor yet a conical pile of sticks, like that over which an Indian cowers, receiving that subtle aroma which gives to the gentle red man one of his most noticeable characteristics. We planned a white man's fire—a noble array of logs piled with that spendthrift prodigality impossible except in the forest; one which would last throughout the night, and in the cold gray of the dawn still glow and radiate a genial warmth. So with the help of our friendly Swede we cut down a stately birch and a couple of hemlocks, the latter yielding both fuel and bedding. The first blow of the ax gave me a new experience.

The steady snowfall of the past week had covered the trees, and as there had been very little wind, every branch drooped with its accumulated burden. An ax stroke on the trunk of a tree whose limbs are waiting a chance to dislodge their covering of snow produces an immediate result quite surprising until you have tried it. When you have tried it once you do not try it again; you stand discreetly to one side and throw sticks at the lower branches until they are cleared. Then you sneak up and hit the trunk a good lusty thwack with the ax, and stand quickly from under. After that you can chop in comfort.

The fire was an artistic creation, in the building of which was much joy. We laid a couple of stout birch logs

on the ground with their ends against the rock; across these we piled other logs,

"The knotty forestock laid apart,
And filled between with curious art,"

until we had a substantial structure containing enough wood to build a farmhouse of modest proportions.

With the hemlock boughs we covered the floor of the tent, making a fine springy couch of generous thickness, and with the head scientifically arranged at the proper height to enable you to lie in bed and watch the fire. For that is one of the highest forms of bliss to which poor weak humanity attains. If you do not enjoy lying under a blanket and watching a fire through the opening of the tent flaps, it is either because you lack experience and are therefore ignorant, or because your nature is base and sordid. If the former is the reason, there is hope for you; if the latter, there is none; you are of the mud muddy.

When the substantial part of the home building was completed, we made a sort of pretense of watching the runway for deer. But we both appreciated—though perhaps neither would have acknowledged it—that it was a mere pretense, and that it would have been a real disappointment to wound a buck and have to trail him far from our comfortable camp. So we both returned at about the same time, each pretending that he had come back to start supper in order that the other might be free to hunt.

The birch logs, though covered with snow, took kindly to the idea of fire, and when

"By punctual eve the stars were lit,"

our log pile was crackling and sputtering in a most cheery and companionable fashion.

Our supper was, in its materials and construction, one of extreme simplicity; it did not begin with caviar and end with creme de menthe; but let those who think they can surpass it try—and fail. In a kettle whose size was nicely adjusted to the requirements of two competent appetites, we prepared a mixture of venison, pork, potatoes, and onions, justly proportioned so that each should give the essential part of its better nature to the creation of a noble result. This sacred vessel we placed between the ends of two logs in the fire-place, where the strong, clear, clean heat of hard wood coals would strike it, and begin that transmuting process in which the camp kettle of the forester is so much more successful than the alembic of the alchemist. With this savor rising from our plates, we sat by the fire and watched the shadows of the night stalk out from among the trees and silently invest our camp. And if you know of anything more beautiful than the on-coming of night in the woods, I wish you would share the knowledge with me, for I would go far to see it.

The bed proved all that a sleeper or a sleepless man could wish; and sleeping and lying awake were equally pleasant. The only trouble about sleeping was that it benumbed one's faculties so that he lost something of that keen enjoyment of the time and the place. I remember getting up about two o'clock to replenish the fire which had burned down to a glowing mass of coals whose rosy radiance was reflected on the snowy tree-tops above the tent. The sky was of that dark, steely blue, like the color of a rifle barrel, and the stars gave just the kind of light which was most fitting.

"As the white stars shine
On the dark Norway pine."

I stood by the fire for a while, enjoying the night, and then crept back into the tent, hoping not to disturb the counselor. But that matchless forest comrade was wide awake, and with full appreciation queried:

"Isn't it great?"

And it was.

HORACE KENT TENNEY.

Days with the Wildfowl.—II.

"WELL you are certainly a duck hunter from away back, Pop," remarked the boy as he reached over and lifted in one of the defunct baldpates. "There isn't one hunter in one thousand that would ever have secured that old hen. But aren't they foxy?"

"They are, indeed; much more so than the drakes."

"How do you account for that?"

"Simply because the mother birds, in the breeding season, have to depend much more on their wits and caution, in caring for their little ones. Whenever a wounded mallard dives, hurry and get as near the spot as you can. Then remain as still as death and keep your eyes open. Sometimes they get entangled among the submarine vegetation and drown and are never found, and I have heard old duckers say that they will purposely cling to the weeds and grasses under the water with their bills and deliberately commit suicide rather than come to the surface and fall into the hands of their dreaded foe. This they will do, it is said, when they can see you waiting near by the spot where they lie concealed. This, however, is a trick of the hen birds only. When I am looking for a bird that has dove in a place like this, I generally watch for bubbles or the tendrils of the under weeds and grasses that have been forced to the surface when the bird went down, just as I did with your bird. If you go thrashing around in a boat or in your waders your success will be very problematical. Once off your bearings as to where the duck disappeared, and you might as well give up the hunt."

By this time we had retrieved the last of our dead birds, and as dotted lines were seen in several directions along the distant horizon, we hurriedly pushed back into our blind and made ready for the sport I felt confident was coming ere many more moments had rolled by.

Hurrying back to our blind, Gerard and I arranged things as conveniently as possible, with my open shell-case on the center seat between us, and then kneeling down on the freshly rumped hay, we patiently awaited the evening flight.

"I say, Dad," remarked Gerard, "did you ever see handsomer birds than these?" and he picked up a nice, plump mallard drake and tossed it over to me.

"No, I can't say that I have, but they always look the same to me, especially on a day like this, with its sunshine and fresh, bracing air, and a genial shooting companion in a blind with me."

"Ah, there! now, no nosegays, Pop," replied the boy and before I had an opportunity to continue he added: "Now I want to ask what kind of bird these are, local or fresh arrivals from the polar regions?"

"What is your opinion?"

"Well, from what you have told me about this matter to-day, I would judge that these mallards, anyway, are almost all northern birds."

"You are correct, and I am pleased to see that you have made a practical application of the knowledge I have imparted to you. But look here"—and I selected an unusually fat hen from among the mallards—"here is a bird that has probably been here through the summer, and as she is an old bird, has probably raised a brood here. This is a sure sign that she is a local bird," and with my finger and thumb I forced a dozen grains of corn or more out of her crop, up through the neck and out of her bill. "You see she has been off in one of the few small patches of corn to be found in this neighborhood and has gorged herself on the grain."

"Yes, I can see, too, that she has a different look from the rest of the birds. She looks bulkier and her plumage is soiled and duller in color."

"Good. Those are both infallible indications. When I am able to recognize the birds in the air, I can tell, almost to a certainty, the nature of the grounds where they feed without going to them."

"How's that?"

"Mallards, teal, widgeon, pintails and spoonbills invariably use the shallow waters where they can reach the muddy bottom with their bills by tipping up on end, as you have seen tame ducks do in a roadside pond. They resort to deep water only for rest and to quench their thirst after their hunger has been satisfied. Canvasbacks, redheads, bluebills and blackjacks work only on the deep waters, because they are divers and gather their food from the bottom of a lake from ten to thirty feet in depth. Of course, there are exceptional cases, in both instances, cases in which the non-divers will prosecute their search for food, floating seeds, mollusks, or the refuse left by the canvasbacks and redheads, the stems of wild clery, bits of wapoto, umbellaria and such, and the divers to the shallows, when an abundance of their particular food, such as rice, nut grass and aquatic delicacies, is to be found there. But both prefer their natural grounds, the first named, low mucky ponds, and the latter the broad expanses of deep water, clear, rushing rivers or inland lakes. So you see, my boy, if you can identify the birds readily in flight you can tell where they are bound for, and if you can line them correctly you will have little trouble in finding great shooting."

"Well, Pop," interjected Gerard, "this is all mighty interesting, and I will always cherish this day's shoot with you—but look! look off there! isn't that a line of mallards for you!"

Sure enough, a flock of perhaps sixty birds, had swept down from the hills and were sweeping across the lake diagonally from us, and while I didn't have much hope of attracting their attention, I seized my caller and sounded the quick shrill cry of the hen bird when suddenly disturbed at the sudden arrival of a bunch of strange birds.

The whole flock, which were flying on a line like a detachment of infantry, swept up into the air as the imitated notes of the female bird struck their acute hearing, and when at a sufficient altitude to insure safety from the long, glistening steel tubes of any hunters who might be lurking in the bordering rice or tules, they swerved around and came our way, evidently bent on learning the cause of the sudden outcry of their relative.

Fatal curiosity.

Once up in the air and turned our way, their sloe-like eyes quickly discovered our decoys bobbing and glistening in the open waters just off the tule-shrouded point where we crouched in breathless expectancy, and, taking them for a feeding flock, they came sliding down the air toward us.

"Ready, Gerard?" I whispered, peering out through the interstices in the rushes at the swiftly advancing birds, and thrusting my gun out for quick action.

"All ready!" echoed the boy, cautiously.

Heralded by that mellow cackle, which invariably signaled the descent of a flock of hungry mallards, the long line came swiftly on, growing rapidly larger as the line widened out; for the mallard, though seeming a slow flyer compared with the teal or redhead, is really a bird of swift flight. On they came, with that cackle increasing and becoming clearer, until it was hard to resist the impulse to rise up and peer over the tule tops. But neither of us did any such foolish thing, but we grasped our guns a little tighter, to be sure, and shifted a bit, to have them in the right position for speedy and certain work when the supreme moment should arrive.

Alas, me! Tom and Scrib and Bill and Judge, how often have you and I crouched just so before; what tingling, thrilling moments we have known in the golden past, in our tule blind, at break of day or set of night, in those wild sandhills?

"Sh!" and Gerard's dove-colored corduroy cap protruded slightly, like a miniature sand dune, above the arrowy line of vegetation, and I, too, straightened up a little, then we lowered carefully again.

And such had been my experience hundreds of times before. A lack of patience has many a time proved the undoing of the oldest and best skilled wildfowler, even when the birds seemed within easy killing distance, and when we saw the long line, with a confused cracking of swerving wings, and a querulous volley of squawks, swing off just enough to carry the nearest bird safely beyond all reach of the threatened danger, we realized that there are some things in duck shooting that always repay their cost, and the foremost of these is patience.

No time for vain regrets or criminations, for where the yellow of the rice fields joins the blue of sky, another feathered cloud is rising into view. Along the sky the mass is widening out, and again coming straight for us. This time there is no use to resort to the call, which is too often done by inexperienced shooters, for the birds were on the course they had instinctively selected, and all we had to do was to lay low, and stay low, until the time to crack away arrived. No danger

of another mistake on our part. We were as chagrined as we were disappointed, and even more so, but not a word of reproof did either of us utter. We were equally to blame, and silence was discretionary.

So quickly did the birds come that I fancied shortly that I could hear the hiss of their pinions as they set them ready to slide down in to our decoys, with their green necks and white collars almost over us. But not yet, not yet. It is the critical time at which we lost before, and the time when more shots are thrown away than at any other. If you show the top of your head or crook an elbow, you will probably see the line turn away just comfortably out of the reach of your gun—the hardest and longest killing gun in your set, of course. Wait one moment more, and you will hear the tips of their ashen wings fanning the golden air, and feel an intense tone in that loud quack of the leader that stirs a tumult in your blood. And seldom do you see such excitement condensed into so short a space as when you rise to see the air filled with dismayed and affrighted ducks.

Gerard and I poked out our guns at exactly the proper time this time, and at the combined explosion five birds dropped dead or wounded among their wooden prototypes, while the rest created a very medley of wildly flapping and climbing dark-gray and blue-banded wings, with quacking throats outstretched toward all the points of the compass.

By the grace of good luck, both the Kid and I got in an additional pair of shells before the consternated birds could get their bearings, and each got down another; in fact, I got down two, one, a hen with a badly shattered wing. She was curling back over the blind, and, when she fell, it was in the narrow strip of water between us and the decoys, and seeing that she was so hampered by the surrounding weeds and tules as to be unable to move any great distance, we concluded not to overshoot her, but let her be where she would assist in decoying other birds.

"You don't think she can get away?" asked Gerard.

"No," I replied. "You see she is right in a sort of a little weedy coop, and in her desperate condition, she'll be pretty apt to lie still, until she finally keels over dead. Anyway, should she attempt to get away, either of us can get her before she can make a yard."

At this juncture the hen lifted up her uninjured wing and flapping it spasmodically, she began to quack softly to a bunch of birds hurrying across, far above us, toward Hackberry. They failed to respond, and whirling round and round in her narrow confines, she began to signal at every bird she saw, even calling vigorously to a passing flock of "chucking" blackbirds. Presently, a pair of her own kind came down to her entreaties and we killed them both, and finally the evening flight having set in earnest, they came in to her beseeching cries so fast that the youth and I had our hands full. Once, just as the sun was blinking at the rim of the western sandhills and a dreamy purplish light began to mantle the distant plain, she scrambled about madly, and squawked shrilly, until seemingly exhausted, she flattened herself out on the water, and lay as dead, apparently, as any of her ill-fated relatives about her.

"What is the matter with her?" inquired Gerard.

"She has doubtless seen a hawk," I answered, and then, true enough, both at once, we caught sight of a red-tailed hawk coming straight down the other side of the channel, just skimming the tule tops. We stooped down behind the covert of the reeds, and watched the marsh harrier as it came straight on, across the open water and straight for the spot where we crouched.

Gerard shot it as it dipped closer and it fell so close to the wounded hen that she actually tore through the smart weed barriers, and was flapping away desperately with her one good wing, when I keeled her over.

Instantaneously almost with the fall of the red-tail, a flock of bluewings whirled over our heads, but they were going with the wind, and try as hard as I might to lead them, I couldn't do it, and the shot from both barrels whistled harmlessly behind them. Then, another flock of mallards dipped down behind the rushes to the west of us, and knowing that they had not settled in the water, I gave a running call and was answered by a laconic quack. I called again, and a splash, followed by another and another, told us that the birds had lighted just round the point within easy gun shot had there been no intervening tules. As Gerard and I arose and peered intently toward the spot, as if we would penetrate the rushy labyrinth, four redheads came whizzing over the decoys. Two quick reports were followed by two splashes, for each of us killed our bird, but the mallards flushing with raucous cries from around the point, distracted our attention sufficiently to cause us both to miss with our second barrels.

Way down the lake the birds were weaving a veritable net-work in the air, but for some reason or other, only fragments of the flight had thus far found its way up in our direction.

"If we were down there," remarked the boy, with evident disgust, "the birds would be up here."

"Sure," I rejoined, "that is the way it always looks when you are duck shooting. And it is not chance either. We've been popping away here pretty regularly all day and there are a whole lot of the birds that know we are here."

"Yes, and when strangers come in I actually believe they warn them."

"That may be, but—mark! off there to your right, a lone bird. You kill it."

It was a cock pintail and he was high in the air, reconnoitering. He lowered, then rose again, just skirting our line of decoys out of range; but in answer to a soft, trilling whistle, the spike stretched his long sinuous neck, cocked his head and poised himself on fluttering wing, as if debating whether to come closer or retreat. He chose the latter course, but too late, for, as he slanted his white sides toward our hiding place, Gerard cracked away at him, and to our surprise the long neck wilted, and with folded wings the bird came down like a chunk of lead.

"A good long shot!" I exclaimed, as the pintail hit the water.

"A beaut."

"And you killed him dead, too—must have centered him?"

There was a sudden mighty uprising of ducks far down the lake just at this juncture, and as the air kept filling with interlacing streams, three quick faint reports came to us on the soft evening air.

"Ho, ho! We're going to have company. I thought I saw a wagon crawling down the north side of the hills a few moments ago, and I shouldn't wonder but it is the Judge and Charlie. But, get ready; they are coming our way this time good and plenty."

And so they were.

And it was as grand a flight as I had seen in years, and my blood tingles now as I recall the glories of the next half hour. It was a veritable cloud of ducks, canvasbacks, redheads, mallard, teal, widgeon, bluebill, butterball and ruddy, with wisps of jacksnipe, scattering yellowlegs and here and there a snowy avocet.

This advance guard, however, showed no inclination to decoy. They were evidently bound for other diggings and realizing this, the Kid and I made up our minds to get a little sport out of it anyway. And we began to pour it into them. Our first fusilade filled the air with flying feathers, and sent one old russet-hooded canvas sagging earthward off over the reeds, but that was all.

"Too high," I said.

Bang! bang! bang! High or low, we were there for a purpose and that was to shoot. We had plenty of shells and were really indifferent whether we killed many more birds or not. Now and then we would get one down, but they were generally only crippled and we finally agreed to wait until they came within fair range, and settling back, we idly watched the feathered hosts high in the air, hurrying by.

And a wild and wondrous scene it was, and one that I have often pictured before and one I expect to photograph many times in the future, for next to shooting ducks and viewing the scenes surrounding, I love best to tell about them. I have seen many flights of ducks at Currituck and along the famous Atlantic seaboard haunts in the old days, on the Kankakee and the Illinois, but none that equals those I have witnessed regularly every fall and spring for fifteen years in our desolate but majestic sandhills. Incredible, indeed, are the myriads of water fowl that swarm these sand-bound lakes and marshes at nightfall in the seasons of migration.

All at once, after the first big issue of birds from down the lake had passed over us, high in the air, and receded into faint lines in the hazy south, Gerard and I found ourselves the converging point of innumerable birds. Nerves that felt only a slight tremor at the incoming of a single flock now fairly quaked beneath the storm that seemed to break away from every point of the compass. Bunches, lines and strings of feathered rockets rushed toward us at different rates of speed, even the slowest fearfully fast. There we stood plugging away at them with all the eagerness of a couple of novices who had never seen a flying duck, and the consequence was that we were doing little execution. But we didn't care. We had already accumulated enough to make as creditable a showing as had yet been made, and we were simply enjoying ourselves. And we shot till our heads ached; and as flock after flock swooped by unscathed, we registered countless vows on high to hold a rod or two ahead of the next bunch, only to cut loose again and again far behind the whizzing birds.

By this time we hardly made any pretext at hiding. Gerard stood in his end of the boat and I in mine, and if the birds wanted to come we let them come, and if they didn't, ditto.

Wondrous evening!

On the sky the light of the dying day was shattered into countless tints, with everything above the rush line in clear and distinct silhouette, while over all below lay a misty blue haze that but intensified the brilliant colors in the over-arching dome. From the sunken sun a delicate rose light radiated to the meridian, while the upper heavens to the east merged into pale gold and purplish black, fringed with green. North and south the cerulean of the skies shaded into delicate olive tints, shifting into orange immediately overhead. Lower down, toward the dropping orb, towered castles of rich umber, steeped and spired with crimson fire, while under these rolled waves of coppery gold and fleecy streams of pearl and lemon-colored vapor. Over the glittering stage we watched the pouring of a troupe of actors that made the usual scenes of the kind at evening in other localities a show of the Lilliputs.

The ducks were now coming in to roost, and they seemed to come up out of the horizon, from the burning clouds and with a rushing, tearing sound, like the sudden burst of escaping steam, whirling through the darkening air as if they would rend the very earth in their descent. But you old wildfowlers have all seen the birds coming in at this chilly and uncertain hour, and you know what it is. Down they swoop out of the maw of the night. Dense masses of bluebills and black-jacks with wings set in rigid curves, come shooting swiftly by, while long lines of mallards wound out of the depths, their stiffened wings making the air hiss beneath them. On long inclines and sweeping curves pintails and widgeon rode down the gloomy air, while, speedy and accurate as minie balls, blue and green-wing teal pitched from the now glowing zenith, while ruddies, mergansers and butterballs shot by in volleys.

High up, so high we could hardly trace the outlines of their bulky bodies, but plainly hear the sonorous auh-unk! auh-unk! as it fell from their black bills, Canada geese trooped by, while the speckled fronts and white geese filled the air with their clamorous cackle. Hundreds of flocks, traveling from the arctics, swept by with unslack speed. Black in the falling night, the chestnut helmet of the canvasback and the emerald coiffure of the mallard were outstretched for the tow-heads of the distant Platte, and no inducement, unless it was a good load of No. 6s, was sufficient to stop them. Darkly outlined against the topaz sky was the forked tail of the sprig, steering for more salubrious climes, dropping as they went their farewell plaintive cry. Far, far above all these, still bathed in the warm, bright

glow of the sunken sun, floating southward, soft as bits of gossamer, a long line of sandhill cranes, sending earthward through miles of darkening space their strangely penetrating bugle calls.

And what a time we did have in gathering our dead that night. Gerard and I had been so engrossed with the wonders of the evening flight that we never thought of retrieving until the hoo-hooooooo! of the floating crane brought us to a realizing sense of the increasing darkness, then we got about it quickly enough. But work as hard as we did, it was almost plumb dark before we got out of the blind and literally so when we finally got really at work. However, by extreme care and by the light of the torches, made from the hay in the bottom of our boat, we succeeded in recovering about all we got down, and rest assured it was a healthy boat full we labored through the smart weeds and clinging flags to shore with. We did not forget the dead hawk, even.

And what a joyous night we all did have in Francke's old sod lodge that night! A bountiful supper stowed away, every one felt good and every one was at his best, when it came to relating the incidents of the day. When we finally did retire, the coyote was tuning up on the distant hillside, and the south wind was moaning down the valley in a way that told of a change in the weather.

SANDY GRISWOLD.

A Phantom Elk.

Editor Forest and Stream:

I read with a great deal of interest the report of Mr. Wadsworth in the number for October. Many years ago I saw my first elk in what is now South Dakota and Wyoming. That country then was full of elk; I do not suppose that there are many in it now, though it was here that the skin hunters killed them by dozens a few years ago for the sake of two teeth. When we were there in 1856, our party would seldom kill one. The men I was with were from the East, but they were neither tourists nor dudes, but were sportsmen all days in the year, and they gave me orders not to shoot these elk; we could not use them. We had a small party of Dakota Indians with us when we first came into the elk country; they had joined us in Minnesota and kept us camping all winter, until the cavalry met us and sent them off home again. While they were with us, we would shoot a few elk for their use, but always shot the bull elk, never a cow. It was the leader of this party—Charles Remington, from New York State—who taught me never to shoot a doe. We had the muzzleloaders then, but he would never allow us to use a shotgun on deer or on any animal that we could use a rifle on.

I played what I have since considered to be a fool trick on a bull elk while we were in their country; but then I was only a boy of 17, and I have since seen boys of that age do as fool tricks as mine was.

We were in camp on a branch of what was afterwards named Antelope Creek, Wyoming. Our camp was up in the timber in one of the foothills—one of the Black Hills I suppose it was—and at the foot of the hill across the creek was an open prairie that ran away to the south. I came down out of camp one morning carrying a Hall's carbine. There was at least one animal here that Mr. Remington's law was not on, the big timber wolf. I might shoot him, I was told, "He is here looking for the young elk calves the cows are dropping now. You kill him every chance you get," Mr. Remington told me, and I did.

While I was coming down off the hill, I noticed a bull elk all alone was coming in slowly off the prairie after either water or fresh grass. It was still early in May, and while the grass close to the creek here was green, that on the prairie was rather dry eating. I got across the creek without the elk seeing me; he was still a good ways off, then just at the creek bank I found a low shallow place, a buffalo wallow, no doubt, and here I lay down, taking my hat off and keeping the most of my head below the bank, but with an eye on the elk all the time. I meant to let that elk walk up almost on top of me, then jump up and scare the life out of him. That would be all I dare do, for if I shot him I would get a raking down for it.

The elk came on slowly until he came to the green grass, then began to eat, but kept on coming right toward me. The elk kept on until he had got to within six feet of where I lay. I had thought that he would wind me long before this, but the air was very still, and I kept just as still. I thought he was close enough now, and suddenly raising my head above the bank, I sent a mouthful of tobacco juice right at him. I meant to land it in his face, but missed it by about a foot; it was probably lucky for me that I did. The tobacco fell on the grass in front of him, and jerking up his head he gave a snort, then wheeling around, made off, running about 100 yards, stopped, and stood looking at me. I have seen a doe do this more than once when she found that I did not fire at her. It is curiosity that makes them do it, I guess. They want to see what it is that has frightened them, and these elk always seemed to me to be stupid animals, anyhow, far more so than a deer. I stood perfectly still, and the elk began to come back again, taking a few steps at a time, then stopping to look again.

He had left his horns at home, and I did not think him dangerous; so at first I thought to let him come on; but after he had taken a few more of these steps and stops, I began to think that one of his punches given with that big head of his might be about all the horns I would want; and jumping toward him, I gave a yell. He whirled about and left.

I gave Mr. Remington an account of this affair, and he told me that I might have let the elk come up if he wanted to come. "He probably would not have tried to hurt you," he said, "he has no horns and knows it; and they are not at all dangerous at any time unless you do something to make them angry. I have never heard of those bull elks making an attack on anyone; and you seem to be able to get on the right side of animals somehow, however you do it."

I had made pets of my two big team horses, and had them following me around like two dogs; and while the Indians were with us I had made friends with their ponies and could go and catch any one of them when

I wanted him; they would not let one of the other white men go near them, though. But I think if that tobacco had struck where I aimed it, that elk would have been about angry enough to have killed me, if I had not killed him first.

The last elk I have ever seen I found in a country where I had not supposed there had ever been any elk. I should have thought it was too far to the south; but the Comanches afterward told me that years before this there were elk there. I was riding along one afternoon about the first of November up near the northwest corner of what is now Beaver county, Oklahoma (it was "no man's land" then), not very far south of where the Cinnamon River cuts across Beaver county; and while passing through some bushes, the most of them were spruce pine, and grew close to both sides of a trail that was seldom used, a bull elk dashed across the trail not ten feet from my horse's nose, and disappeared in the bushes on my right.

I rode a horse that was not easily scared at anything. I could ride him up on top of a buffalo, but he reared up now and came very near throwing me, and by the time I had him quiet again, the elk was clear off, of course, and there would be little use for me to follow him; but I did follow in the way he had gone for several miles; and though I had no trouble keeping his trail, I never saw him again.

I camped that night with a white wolf hunter named Black. He was a squaw man, but was one of the better class of these men. He earned his own living, and did not depend on the agent for it; in fact, never went near the agent. His squaw was a Wichita. He had a better education than most men of his class have, but had curious notions about some things, ghosts among others.

I told him about having seen the elk, and how sorry I was about not having been able to get him.

"You could not have got him had you shot at him all day. Do you really think you saw an elk—that is, a real elk?"

"Of course I did. I have seen them often enough to know them now."

"Yes, but the one you saw to-day is not a live elk. He is a phantom. I am sorry you did see him; you will meet with some misfortune from having seen him. Everyone who does see one of these phantom elk comes to grief."

"Does your phantom elk knock down the bushes ahead of him, and leave a trail behind him?" I asked.

"No, of course he does not."

"Well, this one did, and if I had been on foot, or had seen him sooner, you would be eating a part of him now. Don't worry; I won't meet with a sudden death in consequence of having seen that elk. There was no phantom about him."

CABIA BLANCO.

How Not to Have a Successful Hunt

Editor Forest and Stream:

Generally it is the successful hunt which is described in glowing colors by your correspondents. Who can blame them? It is more pleasant, and usually more profitable, to tell how a thing is done than to tell how not to do it. However, I propose to illustrate the negative side from actual experience; it may serve a double purpose—to introduce another element of variety into your columns, so teeming with variety and interest, and to help some others to avoid the negative side and win positive success in hunting.

Our party was hastily made up from different hotels and private camps in the Adirondacks. We were four, representing as many different callings. All had a little experience (some more) in deer hunting. All wanted more. A non-professional guide and his son were engaged with a team; duffle was packed into a lumber wagon, and we were ready. No, not quite. The bottom of the wagon-box was nearly covered with guns. Too many; some must sit there, and guns are not easy cushions. Besides, the team is going but three miles, and then twice three must be covered with every man carrying all he is able to camp. The number of guns is cut down to one apiece, and we are off.

The writer had said to his family, "I should be far more likely to get a deer to go alone to my old hunting grounds; but these friends want me to go with them, so I am going for the fun of it." Fun was plenty. The Doctor had never carried a heavy pack; the early September day was hot, the pace was rapid, for the distance was long, and though stripped as for a race, the Doctor sweat as never before. A Turkish bath wasn't a circumstance in comparison. The Doctor's appearance was very laughable; but he was game, and arrived in camp in good condition, though undoubtedly several pounds lighter than when he started.

One of the first news items published in camp was, "the spring is dry." This was not so funny. It meant going nearly a quarter of a mile for water. But enthusiasm was not to be dampened by trifles like that; so after a late dinner, some fixed camp, including new bough beds, and stretched the A tent over the camp, for the roof was old and the storm was threatening; others went hunting. The tired ones watched a pond near camp. B. went into some burned timber and nearly forgot to come back. As night came on, we became anxious about him. He had never been in that region before, and on a previous tramp in another part of the woods he had missed his way to a pond only two miles off, and traveled eight miles before he stumbled into a lumber camp. There he inquired his way to the pond, and was asked, "What pond do you want to go to?"

"I don't know."

"Where did you come from?"

"I don't know."

He had started from another pond and had forgotten the name of each—so he said.

No wonder we were anxious about him when approaching night did not bring him out of the burned timber. We shouted and fired a signal shot. Then, while it was yet light enough to distinguish him from a deer, he appeared, leisurely, but exultant, saying, "I've shot a deer."

"Where is it?"

"I don't know. It fell at the shot, but jumped up and ran like a streak, and it was so near dark I could not get another shot."

We thought it could be found in the morning. Some things were found out before morning. One of them was this—that five men (and some of them large) could not be comfortable in a camp only big enough for three. But you say there were six of us. Yes, but the boy took the best blanket and stretched himself across the foot of the bough bed. He slept so soundly that walking on him as late retirers crawled into bed did not waken him, but in the morning he was completely wound around the post which supported one end of the ridge-pole for the tent. He said he rested well. As for the rest of us—well, it reminded me of the prison ships where men were packed spoon fashion, and not one could turn over unless all did at the same time. And yet at times somebody in camp snored!

After a late breakfast, hunting was resumed. Some looked for the wounded deer, some for others; neither were found. Then B. and the Doctor had a plan of their own. About a quarter of a mile from camp the log walls of an old lumber shanty were still standing. Within easy range a muddy space near a brook looked like a much-used sheep yard. They would go there that night and kill a deer. So before dark a flooring of old boards was loosely laid on the joists in one corner, and at nine o'clock, with the boy carrying a big lantern, they went there. Deer were there before them, and of course retired before the advancing light. But the deer were not frightened, nor the hunters discouraged. Climbing to their perch, they lay down, the Doctor—who weighs nearly 200 pounds—in the middle. He affirms the other two snored. They as stoutly maintained that he lay there laughing, and shook the floor boards so that they rattled. At any rate, although they heard deer near them, they got no shot. But it was a funny contest—men snoring and deer whistling. It puzzled the Doctor to decide which was the louder. At length they gave it up and returned to camp. The weather being fine, the tent had been pitched on the ground, and a bed prepared for two in the hut. So all got some sleep and rest, and were ready for the homeward journey next day.

Deer tracks, elk tracks, and bear tracks, were seen, but the track makers very prudently kept out of sight. Home was reached safely, and two purposes with which we set out had been realized—we had no accident, and we had lots of fun. But we got no game. Why? Lack of work, poor method, and too much noise, are sufficient explanation. The writer has had far more than average success during many years, but seldom when out with so large a party. But, after all, it is not all of hunting to hunt, and the spirit of comradeship cultivated by the camp-fire and the camp stories, and the love of nature, and the strength developed in the woods life, are abundant compensation for all the toil.

JUVENAL.

Capercaillie in Ontario.

TORONTO, Can., Oct. 6.—Game Warden Tinsley is greatly pleased with the success of the experiment tried last year of acclimatizing in Ontario the largest and noblest of the grouse family, the fine game bird known as the capercaillie. Fifty-two of them were liberated in Algonquin Park, some 200 miles from Toronto, and not only had many of them withstood the exceedingly severe winter, but several broods of young birds have been seen. This proves conclusively that our northern country is suitable for their requirements. Some of the birds had been seen forty miles distant from the point where they had been set free at Cash Lake or Canoe Lake, the park headquarters.

Mr. Tinsley does not think they will have many enemies, as they are big, strong, powerful birds, always on the alert, and roosting in trees. They are, like domestic fowl, polygamous, the male bird mating with four or five females.

The capercaillie, in which name the *z* is usually sounded like a *y*, is the wood-grouse, *Tetrao urugallus*, and is the largest of the gallinaceous birds of Europe. The name is perhaps derived from the Gaelic *capull-coille*, meaning the "horse of the woods," or cock of the woods, as it is called, and sometimes mountain cock. In appearance it is not unlike a huge pigeon of dark plumage. The average weight is about 12 pounds, but they have been taken at 16 pounds weight. The bird has a magnificent appearance, standing erect and approaching the size of the wild turkey.

W. W. Thomas, U. S. Minister to Sweden, says the capercaillie is "pre-eminently a bird of the pine woods, or pine mixed with birch, spruce, maple, and other growths. He loves wooded hillsides better than wooded plains, and he must have fresh water near by, either a brook or a spring, or a piece of swampy ground. He is local and not migratory." Mr. Tinsley says of those in Algonquin Park that they have gone into the largest and densest pines, which appear to be their favorite haunt. The flesh of the bird is excellent for table, resembling that of prairie chicken, and it is hoped that in due course they may become plentiful among the great pines in the localities they seek. The Government will strictly preserve them for five years at least, and sportsmen are warned not to approach them with anything more deadly than a camera.

Virginia Quail Immature.

BROOKNEAL, Va., Oct. 6.—Editor *Forest and Stream*: I would advise all sportsmen who intend coming South this fall, to put their trip off as long as possible, as three-fourths of the coveys can barely fly. I saw eight coveys this morning, and none of them were more than half-grown. It is the same down on the North Carolina line.

HERR.

A Winter Feeder for Quail.

WHITINSVILLE, Mass., Oct. 1.—Editor *Forest and Stream*: I send inclosed a photo of a device which we used in this section last winter to feed quail, which I think will be of interest to some of your readers. The idea was brought here by one of our sportsmen who attended the Connecticut Field Trials last fall, and saw it in use there. We call it a feeding trough. It is made to stand on an incline by means of an upright at the rear which does not show in the picture. Being on an incline, it is necessary to have partitions in the trough which form pockets that prevent the grain from all running to the lower end. The idea of the incline is to accommodate varying depths of snow. The feeding trough has a roof also that extends quite a little over the sides to keep snow and rain out of the grain. We further protect the trough by piling pine boughs around it in the form of a brush house. The boughs are supported by steady pieces such as old fence rails or stout pieces cut from the trunks

FEEDING TROUGH FOR QUAIL.

of young trees, which also serve to brace the trough and hold it firmly in an upright position. We also try to select a place under a thick-growing pine tree, and give the whole outfit a southern exposure, so the snow will melt away quickly. The result of the brush house and the shelter of the pine tree is that very little snow ever gets on the ground under the trough, barely an inch in a storm that will show eight or ten inches just outside.

Our experience last winter shows that a trough full of grain will last two weeks without replenishing, though we intend to put in fresh grain at least once a week. The dimensions of the trough are 5 feet long, 10 inches wide, 5 inches deep, pockets spaced 8 inches; roof 21 inches wide, standing about 8 inches above the feed.

We believe we saved a good many quail by means of this device; and we are certain that quail can be carried through any cold and snow that we are likely to have in this section, if they find the feed. The main advantage of this sort of feeding box is that the grain is never covered up by snow; it is always accessible, and none is wasted.

Of course we incidentally feed many other forms of life than quail, such as crows—a little—bluejays, grosbeaks, sparrows, kinglets, chickadees, besides squirrels and mice, and even rabbits visit the grain. The tracks in the snow about the boxes are myriads of all sorts, and sometimes we see where a partridge has looked in upon the supply of feed.

As to the particular results we secured, I know of one flock of eleven or twelve quail that fed in one box all winter, and were intact after the snow was gone. This covey was easy to watch, and they would come to the feed on the fly, stay around the little cleared place for two or three hours, and then take wing again for a near-by swamp. They were seen as late as the last of April, and we have heard them whistling all summer in the open fields within less than a mile of the feeding box. Another box brought through four quail at least that were counted. These were from a flock of only seven at the start. We have reason to believe that three other boxes carried through good coveys, and one or two others showed signs of use. We have besides liberated some quail that we obtained through the Massachusetts Fish and Game Protective Association, and these, we have every reason to think, raised at least four or five broods this season.

We therefore, as a result of all this, have a number of coveys in our covers this fall that we would not have had otherwise, and while we feel we should be saving of them in shooting, we still will be able to take a few, and so help out the interest of a day's sport. We shall put out more feed boxes this coming winter, and liberate more birds next spring, if they can be obtained.

We all believe, of course, that there is no bird that can possibly take the place of the old partridge; but he is getting scarce, and we find that quail fill in a wide gap very acceptably, and it is well worth a little effort to provide means to keep them through the winter. Give the quail a chance to clear the cold and snow, and they will fully take care of themselves the rest of the year, and steadily increase in numbers.

Distinguishing Marks of Waterfowl

EACH year produces, from among the youth of the land, not only a crop of new voters, but also a crop of new shooters. The tastes or circumstances of many of these will lead them to turn their attention to the water fowl. Some of the young gunners will begin hunting without experienced company, and will find it convenient to have means of promptly identifying the species of birds they fall in with. For that purpose the following list of distinguishing marks is offered, the aim being to give for each species, in language free from the technicalities of ornithology, some characteristic point, or very simple combination, which is not found in any other species; thus furnishing a characterization so short and distinct that it can readily be produced from the young hunter's memory, if not from his pocket, and applied to the bird in hand; or, in the case of some of the marks, to the bird seen anywhere within gunshot or even further away. Increasing practice will associate with each species, in the young sportsman's observation, some trait of appearance or action that will identify it at a considerable distance; like the long neck of the pintail, the white wing-lining shown by the black duck in flight, or the erected tail of the ruddy duck as it sits on the water. To this end a knowledge of the comparative size of the different ducks is also desirable, and they are therefore named below in about that order, beginning with the largest. It should be understood, however, that two or more species may average the same size, so that the larger individuals of one kind may outweigh the smaller ones of another which would in the average be heavier. As to their plumage, the ducks vary with age and season, and the colors given here are those which prevail in the months when they are usually shot. Full-grown young drakes are apt to resemble the female rather than the male. A combination of black and white in the coloring of a duck is distinguishable at some distance, and, in connection with the bird's size, shows it to belong to one of limited number of species, and thereby helps toward its identification. In this view the eider, surf duck, old squaw, white-winged scoter, bluebill, golden-eye, ringneck, and buffhead, and the mergansers may be bunched as black and white, although not exclusively so, especially the females.

The list does not profess to name all the species, some being omitted which are unknown or rare in most parts of the country, and not likely to be seen by the reader outside of a collection.

Geese.

CANADA.—The common wild goose. Head and neck black; white patch on cheeks and throat.

HUTCHINS.—A much smaller bird, with the same coloring.

SNOW GOOSE.—All white, except black ends of wings. Two varieties, differing in size only, like the two above-named.

BRANT.—Head, neck and breast black; whitish spot each side of neck.

WHITE-FRONTED.—Chiefly brown; white around the bill in the adult; same region dark brown in the young.

BLUE GOOSE.—Head and some other parts white; otherwise mainly bluish-gray.

Ducks.

EIDER.—Drake black and white; crown black; white crescent on each side before tail. Duck brown and black speckled. In both the upper bill is forked at the base, branching toward the eyes.

MALLARD.—Drake's head green; a white collar below; breast reddish brown. Duck streaky brown. In both a broad purple stripe across the wing, bordered at each side by a narrow black and then a white one.

BLACK DUCK.—Blackish brown, lighter about head; wing-mark blue-green; wing white inside. Duck and drake similar.

SURF DUCK.—Drake black, with white on forehead and back of neck; base of bill light, with large black spot each side. Duck dark brown, whitish under eye; webs of feet black.

CANVASBACK.—Drake's head reddish or bay; breast black; eyes red. Duck mainly brown; bill black in both, and forehead low.

REDHEAD.—Colored much like canvasback, but bill bluish, forehead high, and eyes yellow.

LONGTAIL (Old Squaw).—Drake black and white, with two very long black tail feathers; face gray, darkening downward to blackish; bill black with reddish bar. Duck's head white; crown and cheek patch blackish; bill and neck short.

WHITE-WINGED SCOTER (Velvet Duck).—Drake black, with white spot under eye; bill humped, black, white and red. Duck dark brown; white before and behind eye; large white wing mark in both.

PINTAIL.—Drake's head brown, breast white, with a stripe of the same continuing up each side of the neck; two long black tail feathers. Duck buff, with spots; wing mark in both green, edged with white and black; neck long and slender.

GADWALL.—Head, in both duck and drake, gray, speckled with brown; both have the wing striped chestnut, black and white. Duck's legs yellow.

SHOVELER.—Bill very large and much widened toward end; in both duck and drake a light blue patch on the wing.

WIDGEON.—Drake's head whitish, speckled with black; on the side a strip of green; containing the eye, like the nucleus in a comet; front of the wing white. Duck mostly brown; bills and legs light bluish-gray; green-black wing mark in both.

BLUEBILL.—(Scaup, two sizes.) Drake's head, neck and breast black; belly white; duck dark brown, white around bill; wing mark white in both, and bill blue.

BLACK SCOTER.—Drake all black; bill orange and black, with hump. Duck grayish-brown; whitish about cheeks; bill black.

WOOD DUCK.—Drake's head green and purple, with long crest, traversed with two white streaks. Duck, gray-brown; eye in white patch; white line around bill. In both, lines of triangular white spots on breast.

GOLDEN EYE (Whistler).—Drake has green-black head, with oval white spot under eye; legs, orange. Duck's head dark brown; whitish ring around neck. Both white below, and have part of wing white; eyes bright yellow.

RINGNECK.—Drake has black head and neck, with brownish collar; bill striped with pale blue. Duck's face and chin whitish; both very dark above and have a gray wing mark.

CINNAMON TEAL.—Drake's head, neck and under parts clear chestnut.

RUDDY.—Duck and drake similar; bill very broad, especially at end; face light, with dark bar running back from bill; plumage reddish brown above and barred below; wings and tail brownish black.

BLUE-WINGED TEAL.—Drake has white crescent in front of eye; duck speckled brown, with white throat. In both, front of wing sky-blue.

GREEN-WINGED TEAL.—Drake's head chestnut; eye in green patch, like widgeon's; white bar before wing; duck streaky brown, wing mark green in both.

BUFFLEHEAD (Butter-ball).—Drake's head black, with large white triangle at the back, each side; duck has a white spot behind and below the eye, and white wing mark.

Mergansers.

The mergansers are somewhat indiscriminately called sheldrakes by gunners, as the scoters are called coots. They may be recognized at a glance by their slender, cylindrical bills, hooked and toothed, quite unlike the broad, flat bill of a duck. All are more or less crested. The most conspicuous features of the males are as follows:

AMERICAN MERGANSER.—Head green-black; neck, breast and lower parts white, with salmon tint.

RED-BREASTED MERGANSER.—Head like the American's; broad white collar, interrupted at the back; breast brown, streaked with black; at the front of the wing a patch of white feathers surrounded with black.

HOODED MERGANSER.—Head black, and with crest raised shows a large quarter-circle of white back of the eye.

The female mergansers show brown or gray where the males are black, and they have a strong family resemblance to each other. The hooded may be distinguished by her smaller size and brown eyes and feet. The other two are considerably alike, but the American has the nostrils about half-way down the bill, while in the redbreast they are much nearer its base. FOWLER.

Ducks on Long Island.

THERE are few sections of the country that furnish more attractions to the duck hunter than the Great South, Shinnecock and Peconic bays. It has been, however, for some few years past somewhat of a problem for many duck hunters to solve just how to get good shooting on these bays, and at the same time surround themselves with safety and economy. At best, however, it costs something to shoot ducks anywhere; it is not a cheap game, and when one reckons the short distance one has to travel from New York to get to the shooting ground, with the saving of time and money in travel, Long Island naturally becomes attractive to the duck hunter.

Safety and success in getting birds are largely due to the competency of the captain in whose hands one lands. The captain should not only be weather-wise, noting any change of, or rising of, wind, but have safe batteries, sharpies, and shooting boxes, be a good shot himself, and with it all be an honest man, giving full measure and only asking a suitable return. And this reminds me to say in behalf of these baymen, and for the benefit of those who think they have been, or may be, over-charged, that when one comes to reckon the cost of a full "outfit" for shooting ducks on the Great South Bay, it takes, even at good prices, a long time for the owners of these rigs to realize a good percentage of profit on their investment, and some years of early and late labor to get their money back.

It is not my purpose, however, to deal with investments, but tell where and how good shooting may be had on Long Island, good treatment insured, and plenty of ducks obtained, providing always, of course, the weather conditions are good and the man back of the gun can shoot well.

At Babylon it is mostly all battery shooting. There are, however, some places on the south side of the Great South Bay where some point shooting is done; but at this particular place the best results are obtained from a battery. From Babylon one can secure three different rigs, and I am informed that they are all reliable ones. Mr. Sherman Tweedy, the proprietor of the Sherman House, will secure them for his guests who write him a few days in advance.

At Bayshore there are three reliable rigs for battery shooting. One of the best on the whole bay belongs to Capt. Chas. Veltman, the owner and master of the sloop yacht Madaline, and when engaged himself he will secure the other for gunners who desire to go out from Bayshore. Captain Veltman takes his gunners aboard his boat on their arrival in the village. The yacht has four comfortable sleeping berths, and contains a galley for cooking; and he sails to, and remains on, the shooting grounds during his guests' stay. In this way the shooter steps from the breakfast table to the battery, and is ready for the early flight of birds. For this the Captain charges \$10 per day for the rig for one or more gunners, the gunners paying in addition for the food eaten.

The next interesting point going east to secure good shooting is Bayport. From here rigs can be secured covering the bay west several miles, and to the east for as many more. Mr. Henry Stokes, the proprietor of the Bayport Hotel, has made arrangements with the two reliable owners of rigs in Bayport, and with three more at Sayville (only a mile away) to accommodate his increas-

ing number of guests for this fall's shooting, and by notifying Mr. Stokes a few days in advance, one is sure of good service both afloat and ashore.

But a short mile and a half east of Bayport is Blue Point. Blue Point is small, indeed, on the map, but mighty in reputation. It is the home of the oyster and the residence of Capt. Billy Graham, the proprietor of "Ye Anchorage." This artist on canvas and bay alike needs no word of mine to say that he loves to take his guests duck hunting, and does so as often as he can. Capt. Graham assures me that he is in shape to take care of his old friends this season, and is willing to make some new ones if they come along.

Patchogue, while it has become one of the manufacturing and commercial centers of Long Island, its limitations are on land, and this once famous duck shooting resort for all time to come will afford the duck hunter a good base from which to indulge his taste of the day in the battery. One of the most enthusiastic duck hunters in Patchogue is Mr. Fred C. Thurber, the proprietor of the Central Hotel. Mr. Thurber knows personally every captain who takes gunners out, and can secure for his guests the choice of these rigs; but, as in other places, Mr. Thurber should be written to in advance in order that he may secure the right men.

Bellport, just east of Centre Moriches, has been a favorite shooting resort of a great many gunners for a number of years, but conditions there are such that the stranger is not apt to get so well cared for on account of the limitations in the way of shooting rigs. The next best place for the average hunter to go after leaving Patchogue is Centre Moriches. Here can be found a number of excellent rigs that can be chartered by the public at any time through Mr. J. W. Rose, the proprietor of the well-known Long Island Hotel. Mr. Rose is a hunter himself, and knows the Great South Bay from one end to the other, and takes great pleasure in sending sportsmen to the right points for shooting. It is a well known fact to a great many sportsmen that from Centre Moriches east for about six miles the Bay is owned by the Smith heirs under an old English grant, and this tract of bay has been leased to one man who uses it for his private shooting purposes; but lying east from Centre Moriches there is a splendid stretch of water connecting the Great South and Shinnecock bays, where both battery and point shooting may be had that is just as satisfactory as this west property. On these open grounds there were 300 ducks killed this season on the opening day. Besides having at command these desirable waters, one has the comforts of an excellent hotel in addition.

The second station east of Moriches is Eastport. Here the duck shooter can find not only good accommodations, but one or two excellent rigs. Near the station stands the Eastport Inn, and the proprietor, Mr. Westerhoff, is very fond of shooting, and often goes along with his guests. One can secure not only battery, but point shooting as well. Mr. Westerhoff can secure for his guests both sharpies, shooting boxes and shooting batteries. At this point, in addition to the accommodations that can be had at the Eastport Inn, a short half mile from the station is the Bayside Hotel. Harrison Rogers is the proprietor, and has for a great many years looked after the interests of all the shooters that come his way.

The next interesting point for the shooter to visit is East Quogue; and certainly no part of Long Island possesses more interesting sport than can be found here, or a more fitting way of indulging in it. At East Quogue one can secure the services direct of the well known hunters, Eugene Jackson, Harry Carter, and W. G. Hearne. In each instance these gunners take their guests to their own homes for living accommodations. All three of them own both sharpies and batteries and use many live decoys both of ducks and geese. East Quogue is now, and has been for a great many years, one of the most desirable places to shoot on Long Island. Just beyond East Quogue one comes to Good Ground, and unquestionably the hunter can find most excellent shooting there. At Good Ground they have a great many pleasant advantages for the visitors, because it lies in between the Shinnecock and Peconic bays. There are many of the best of the marsh ducks that come into these bays early in the fall and remain until the bay freezes over, furnishing most excellent sport. In the way of accommodations one can have the choice of two places. Right by the station is the Columbia Hotel, of which Mr. Chas. E. Rogers is the proprietor as well as one of the best known duck hunters in that section of the country. Mr. Rogers not only owns his own rig, but has at his command a number of other very reliable ones. A mile from the station can be found the Canoe Place Inn. This inn is a very pleasant hostelry, indeed. Mr. Buchmuller, the proprietor, has introduced a very pleasant café service, from which he furnishes meals at all times day and night, and is in touch with all the bay men in that section of the country. In addition to the duck hunting to be had at Good Ground, there is good quail and rabbit shooting there. Mr. Rogers, of the Columbia Hotel, has a pair of very excellent dogs, and furnishes a good guide to take field hunters out for quail and rabbits; and he informs me that the shooting for this sort of game is very good indeed.

There are, of course, other places along these bays where one can be taken out on the bay and possibly secure ducks, but a careful study of the situation from Good Ground to Babylon has convinced the writer that he has searched out and found the best places for the duck shooter to go to. In each and every one of the instances mentioned he knows positively that the visitor will secure good service, good living, and not be over-charged for the excellent service rendered him. As I have mentioned before, it is particularly desirable that the hunter, in making a visit to Long Island for the purpose of killing ducks, should write some days in advance, if possible, of his coming. In this way he will not be disappointed in finding the rig that he hoped to attain rented out to someone else. A study of the conditions for good shooting this season reveals the fact that not in some years has there been so many ducks come into these bays at this early date in October. An interesting feature connected with this early visitation of these migratory birds is that so far those killed have been in many cases young birds. The gunners say that this indicates a heavy flight during the season, showing conclusively that the breeding season was a good one. T. E. BATTEN.

Maine Deer.

BOSTON, Oct. 8.—*Editor Forest and Stream:* Several Massachusetts sportsmen have already returned from New Brunswick with moose; among them Dr. Heber Bishop, of Boston, who was accompanied by Mr. C. K. Fox, of Haverhill, and my old friend, Jack Seward. The Doctor rarely fails of finding big game. Many have already gone into Maine, where the season opened the first of this month. Mrs. C. S. Jones, of Bangor, was the fortunate huntress who sent to the wardens the first report of killing a deer since the opening of the season. Near Greenville, at the foot of Moosehead Lake, she brought down a fine buck at a range of some 300 yards with a bullet through his heart. A party of five Boston hunters shipped seven deer through Bangor on the fifth, on which day the whole number checked at that point was 19. In Weld two deer were killed on the opening day, and in Kingfield three. As usual on the opening, and for some time previous, confident predictions of "the best hunting season ever known" are circulated broadcast, backed by the statement that never before were so many deer and moose seen in the woods of Maine. The Spenser Stream region and Moose River country have furnished a number of moose every year. Deer and bears are reported numerous in the Dead River country. Farmers about Flagstaff have been forced to devise deer-scares in order to keep them from their fields of growing crops. Bears are reported very numerous in this region, as they are also about Kennebecago and in Washington county. Mr. Allan Montgomery, of Boston, made his first trip to that region this fall. In the Basswood Ridge, a few miles from Calais, he came upon a bear which he shot. While dressing it he looked up and saw two more coming toward him. He shot both, making a record as a bear hunter, having killed three within an hour.

Captain Collins tells me he has issued a dozen orders prohibiting sawdust pollution of streams this year—making about 125 such orders since his appointment on the Commission five years ago.

Mr. Charles H. Cutler, a special officer of Dracut, remonstrated with two young Greeks for shooting robins. He informed them that he was an officer, and exhibited his badge, but they continued to shoot, and he seized one of the guns. This angered the second man, who fired a charge of bird shot into the officer's body and legs, and then ran away. Mr. Cutler is reported dangerously injured, and was removed to the Lowell Hospital. George Legugos has been arrested, and four robins were found in his pockets. He is believed to be one of the culprits, and the other is known to the police. These ignorant and lawless aliens are doing much to hasten the day when a gun license may become a necessity, however objectionable it may be; there are, of course, many objections to it. It would be unpopular, I think, with the farmers, and would cause many of them to post their land and keep the gunners off.

The case of Fred. Parsons, fined \$70 for having short lobsters in September, came up again in Salem, October 4, and the fine was re-imposed. When his counsel tried to have the fine reduced, Warden W. W. Nixon urged upon the court that if changed at all it should be increased, as he had been previously fined in the Superior Court.

For shooting six robins on the shores of Wenham Lake, Frank Morale was fined \$60 this week in the Salem court. CENTRAL.

Notes From the Game Fields.

California Public Sentiment.

SAN FRANCISCO, Cal., Sept. 29.—*Editor Forest and Stream:* There has been a large increase in the number of quail in this State since the non-sale law went into effect. In fact, most all game shows an increase, except, possibly, ducks. We hope at the coming session of the Legislature to have the bag limit reduced from 50 to 25, and, if possible, prohibit the sale.

Deer have been more plentiful this year than for several years past. We are beginning to reap the benefits of the non-sale of deer hides, which has had the effect of putting the hide-hunter out of business; consequently there is no premium on a deer hide, and the animal is killed only for food and sport.

Public sentiment in this State has changed very materially for the better in the past three years. Convictions are obtained in the remote sections of the State for violations of either fish or game laws. The people seem to have become awakened to the necessity for the restrictions that are placed upon the taking of fish and game, and we are supported in a more encouraging way by bringing in convictions in jury trials. It is not many years ago since a jury trial was equivalent to an acquittal. This condition has been entirely reversed. The result is that defendants seldom stand trial but plead guilty and pay the fine, seeming to consider it is the cheaper way.

CHAS. A. VOGELSAW,
Chief Deputy Cal. Fish Commission.

Maine.

WALPOLE, Me., Oct. 2.—*Editor Forest and Stream:* I have seen deer tracks in plenty. Partridges suffered here as elsewhere from the severe snows of last winter with thick crusts. Woodcock are not here yet; I have started a few; another week or two at most will see the last of the flight. E. H. F.

Pennsylvania.

SAYRE, Pa., Oct. 8.—*Editor Forest and Stream:* The game reports agree that the crop of squirrels is pretty near, if not quite, up to the standard of recent former years. Ruffed grouse in the old-time covers are plentiful, and full of the spirit that tries the endurance of even the strenuous sportsman. On some of the local high lands, and up the Chemung River Valley, some nice bevvies of quail may be started at any time. What may develop in respect to the woodcock only the flight of these fascinating migrants will disclose. In the old secluded retreats, during July, when the law provides for the shooting of the immature and developing longbills, some nice broods were discovered, but these birds, or what were left of

them August 1, have long since vanished from the grounds then familiar to them. It is a great pity that this illogical and unwise, and unquestionably destructive enactment cannot be erased from the statute books of the State. These birds are too scarce and by far too precious to be potted in their age of helplessness. Better one October woodcock with the sport of the thoroughbred in him, than a kettle full of pin-feathered chicks served in July.

In the southern tier of New York, grouse are unusually plenty, say reports, with squirrels reported numerous in some sections and correspondingly scarce in others. A bag of six to eight grouse is said to be a matter of easy attainment for a good wing shot anywhere between West Danby and Van Etten along the line of the Lehigh Valley Railroad. Rabbits are found in force in both New York and Pennsylvania covers. M. CHILL.

North Dakota Wildfowl.

GRAND FORKS, N. D., Oct. 4.—*Editor Forest and Stream:* The conditions for game in North Dakota this season have been very favorable. Prairie chickens have been, and are, very plentiful, although comparatively few were killed the first two weeks of the open season on account of a very small percentage of the grain being cut, which gave excellent protection for the young birds from the gun, and the consequence is that there will be a good supply of birds left over for propagating next season.

North Dakota, no doubt, has more local ducks this season than usual, and this I attribute to the lateness of the spring and during the migratory season more of the birds remained here than usual, and nested, there being abundance of water in the marshes and pot holes. It is now a very easy matter for the sportsman to reach his limit on ducks during a day's shoot. The duck shooting will be improved in about ten days or two weeks, when the northern birds commence to drop in. The quality of local birds seems to be improving, and in recent years I notice quite an increase in canvasbacks and redheads, and especially so this season. In about two weeks the sportsmen will be able to wake up and have their dreams a reality by being able to look over the edge of their pit and see the big birds (the geese) setting their wings to see what is the meaning of a bunch of decoys on their feeding grounds (the stubble fields), and in the northern part of the State we have always enjoyed excellent goose

shooting, and know of no reason why this season should not be equally as good, if not better, as water and feed are in abundance. CLARENCE A. HALE.

Utah has "Much Hunting."

SALT LAKE CITY, Utah, Sept. 30.—*Editor Forest and Stream:* The outlook for hunting is about as usual. We have any amount of hunting, but not much game, with the exception of wild water fowl, which is reported more plentiful this season than usual. But to-morrow is the opening day of the season, and as hundreds have gone out this evening to take advantage of the first flight, I expect that in a few days there will be no birds to be seen. JOHN SHARP, Commissioner.

Deer Abundant in Arizona.

PHOENIX, Ariz., Oct. 11.—*Editor Forest and Stream:* Our deer are more plentiful than for years, and in fine condition, owing to heavy rains all over Arizona the past two and a half months, causing abundance of feed in the mountains. Several hunting parties have gone out prepared to stay two or three weeks, and have returned in five days with the limit. Several deer have been killed this year within twelve miles of Phoenix. Quail, ducks, geese and rabbits are very plentiful, and will be all winter. Doves are so numerous all the year as to be almost a pest. W. Z. PINNEY,

Secretary and Member Fish and Game Commission.

Idaho Game, Native and Imported.

HAGERMAN, Idaho, Oct. 3.—*Editor Forest and Stream:* The ducks and geese are very plentiful, and we had a good crop of sage hens and grouse this year. The deer and elk are on the increase. We have planted a few pairs of Chinese pheasants in Latah county, as we think they will do well there. Deputies returning from the Clearwater, report that hunters have done well in killing deer and elk and mountain goats in those parts. W. V. JONES,

State Game Warden.

Oregon Deer and Birds.

COTTAGE GROVE, Ore., Sept. 29.—*Editor Forest and Stream:* Game is plentiful this year, especially deer and

birds. Elk cannot be killed before September 15, 1907. I think the prohibiting of killing them will be extended next winter when the Legislature meets.

J. W. BAKER,
State Game Warden.

New Mexican Large Game.

SANTA FE, N. M., Sept. 29.—*Editor Forest and Stream:* Game has increased during the past two years, and the outlook for this winter is very good, especially for large game—deer, bear, and lion. P. B. OTERO, Warden.

Long Island Ducks.

NEW YORK, Oct. 6.—On October 1 Oscar B. Smith, of Morristown, N. J., and myself, at East Moriches, bagged 11 black duck, 12 blue-winged teal, 2 green-winged teal, 2 broadbills (lesser scaup), and one pintail; also a fine specimen of the duck hawk. Our gunner was Elwood Brown, and we shot from the east end of Reeve's Island.

The pintail and a broadbill were found to have pinfeathers on, so winter ought to be mild, if "Lyn" Oby" is correct. We saw a great many blue-winged teal—several large bunches. ROBT. B. LAWRENCE.

EAST QUOGUE, Long Island, Oct. 10.—By request, I send you the number of ducks shot here: October 1, 27; Oct. 3, 15; Oct. 4, 8; Oct. 5, 14; Oct. 6, 10; Oct. 7, 12; Oct. 8, 10. The ducks were blacks, sprigs, and widgeons. Snipe, yellow-legs, plover, and creekers were killed each day. There were some geese on the 8th; we saw about 100. It is quite early for geese. E. A. JACKSON.

"The Rule of Oby."

NEW YORK, Sept. 29.—*Editor Forest and Stream:* Who killed a broadbill, a sheldrake, and a black duck on Long Island on Sept. 17, 1904? Duck law opens on October 1. Am surprised and grieved. I suppose it was "Lyn" Oby." R. B. L.

[We do not know who killed the ducks out of season. It was probably done for scientific purposes; but even so, a naturalist's permit with penal bond of \$100, would have been required.]

SEA AND RIVER FISHING

Bob.

From the Log of Camp Nessmuk.

THE story of Camp Nessmuk would be incomplete without, at least, a mention of Bob—Old Bob, we lovingly called him.

Bob was our dog; rather he claimed kinship with Pap, though I believe he really belonged to the mistress and children at home. Bob was of the collie breed, his forebears hailing from auld Scotia's rough and rugged soil. The long-pointed muzzle, shaggy, tawny coat, pointed, shapely ears, keen, intelligent eye made an ensemble bespeaking blood of high and ancient lineage.

Bob was a young dog, hardly a puppy, yet, he had not attained to the wisdom and dignity of an older dog, and who so wise, so dignified as an old dog. He has learned wisdom from rough-bought experience; dignity sits him as though born to the cloth. While Bob was, perhaps, fully grown, being quite large for one of his ilk, yet his ways were youthful and puppy-like. His manner was awkward and with strangers he might have been at times, maybe, a bit fresh.

Bob was a handsome dog. And who so lacking as not to love a handsome dog? Truly, the dog is man's best and truest friend, save woman; on his everlasting friendship you may safely count, even though the world has cast you beneath its haughty gaze. The good company and real companionship one receives from his dog is an unknown factor only to those who have been denied that boon—the confidence and friendship of a good dog.

Bob's early training had not received that careful supervision so necessary with young dogs and boys if they are to be best fitted to avoid the snares and temptations of a wisely wicked world. He early acquired some habits, as boy and dog are apt to do, not very bad ones; but in the end they brought him into disgrace and caused his banishment from the home of his puppyhood, consequently from the joys of a Nessmuker. He had a mind to run out at passing wagons and bark at horses; he had even been known to grasp a rapidly revolving spoke and make a flying summersault through the air. In his big bungling, playful way he would jump against fat women, and, while Bob's intentions were of the best, his attentions were rather hard on the nerves of his more timid victims.

I think it was the mistress who suggested that we take Bob along to camp. He had recently been guilty of some little indiscretion and she wanted to have none of his blood on her hands, as it were. So Bob became a Nessmuker; a right good one he proved.

Did you ever stop to think of the distance a live, active dog travels in making a journey of twenty or thirty miles? Aren't his powers of endurance simply wonderful? How many miles he does cover. In and out, across the road, over the fence into the field, then over again and ahead, only to come back and run behind to see something apparently missed a moment before; always on the go, he must fairly treble his steps, yet he never says "quit," and turns up at the end in good condition.

Bob entered into the spirit of the week and became an ardent fisherman; his lot was cast with Pap and Pard, and he remained a faithful henchman on their many trips up and down the 'Sock. He must have acted circumspectly, else Pap would have interdicted his going. He, no doubt, remained demurely in the rear, patiently refraining from rushing in where they were about to cast. The late Seth Green—apostle of fishing and fish culture, our Izzak Walton—somewhere says that fish have no sense of sound, protecting themselves by their vision which is exceedingly keen, a falling leaf sending them scudding to cover. So if Bob kept out of sight he could do no harm.

Bob was an arrant coward at night, but not in the daytime, for he had spirit and would fight. He was not to be imposed upon by base and ignoble brutes, and had no end of snappy encounters during the week under the maples with the mangy curs belonging to Miller. His manner of fighting was not of the hold-and-hang style of the bulldog, but after the quick, snappy way peculiar to shepherd dogs. Who can blame poor Bob if, after the darkness had settled over our leafy world, the fire burned low and the blanketed forms of his fellow Nessmukers had sunk into the arms of Morpheus, he quietly sought the feet of Pap and curled himself for sleep on the blankets? Not I. For I like not the lonely watches of the night when the sounding stillness that broods o'er the mountain fastnesses is broken only by the chirping of the crickets, the ceaseless reiteration of "katy-did" and "katy-didn't," monotone of murmuring waters and sighing winds, the lonesome cry of the whippoorwill and the haunting plaint of the night-hunting great owl or the horse-like whinny of the little screech owl—all depressing sounds apt to get upon one's nerves. Bob had my sympathy.

Who can honestly claim to be without the sense of fear in the darkest hours of night when dire occasion fares him forth afoot and alone to brave the unseeable and unknowable dangers that may lie in wait in his path? I am free to confess that from my boyhood up the dark has held many terrors, though I know not what they can be, yet, they haunt my every step into the impenetrable void of blackness, and require the exercise of the coward's courage to exercise them. It is not the mere sense of loneliness or fear of unseen danger; but is it not rather a remnant of that fear of the dark come down to us through the countless generations of men since our forebears of the stone age dwelt in fireless caves and shuddered the terrifying night away while pliocene monsters raged without? For with the rising of fair Luna above the mountain's crest, lurking fear flees as the mists before the day-bringing sun. I am often led to speculate on how much nicer this old world would be if we had two moons, or better, Jupiter-like, four; perhaps one would be always full.

Although Bob was an honored guest, and that we justly prided ourselves on the open-handed hospitality of Camp Nessmuk, there are those so fortunate as to have enjoyed it, who will bear me cheerful witness, truth compels the reluctant admission that Bob fared

but indifferently well. His daily fare was not so sumptuous as he might have wished and the occasion warranted. A fish diet, even though it be of the dainty of dainties—trout—is not the most robustious and satisfying for a healthy, hungry dog. We, however, did the best we could by him, feeding him premium dried beef at twenty-five cents per, and whatever from our larder we could spare and he would eat; but he must have wagged his tail with evident relief when he returned to the fleshpots of home, for he was gaunt and hollow from his menu of fish, alas! too oft but the bones.

That was a battle royal Bob waged with Miller's old black dog just when the wagon was starting for home. Miller, his dogs and kids, vulture-like, were on hand to see what they might pounce upon, when before some unknown cause Bob, who liked not the pack of 'em, man, kids, dogs, pounced upon the old dog. It was short, sharp, fierce, and created no end of excitement for a few moments. Luckily for Bob, the old dog was shy on teeth or it would have gone hard with him.

Shortly upon his return home Bob got into an unpremeditated mix-up with a man, a horse and a churn; the horse was frightened, the churn broken, the man wrought to a mighty wrath.irate and obdurate he sought out Pap, who, as alleged owner of the dog, was demanded to make good. Pap, with the instincts of the true sportsman, demurred, and started forth on a visit among his legal friends with a view to discovering the status of the dog and his master before the majesty of the law. After completing the circle of the half dozen shining legal lights of his fellow Nessmukers (feeling in kind) and finding it more disconcerting than a case of school discipline *a loco parentis*, he settled. Bob was banished.

Poor fellow, we missed him next year.

WILLIAM WALTERS CHAMPION.

Susquehanna River Fishing Notes.

SAYRE, Pa., Oct. 8.—The law permits the use of eel pots or fish baskets for catching eels, provided the user of such a device has previously procured a license, which is described as being in force only from the 25th day of August to the 1st day of December of the year in which it is issued, it being necessary to renew the license annually. The eel crop is said to be unusually large this season, and experts estimate that 20,000 eels have already been caught. A local river fisherman lately caught 1,700 eels during a single night, so it may reasonably be inferred that the above total estimate is under rather than above the actual figure.

Dip nets of prescribed size may be used during the remainder of the year for the taking of carp, eels, catfish, and suckers in waters not inhabited by trout, and as a result, this class of fish are being taken in considerable quantities both in Susquehanna and tributary waters.

The bass and pike fishing has been poor for some time, owing to the peculiar conditions of the river which sometimes obtain at this season of the year. Improvement, however, is anticipated to occur shortly.

M. CHILL.

Water Pollution.

ALTOONA, Pa.—*Editor Forest and Stream:* At a regular meeting of the executive board of the Altoona Rod and Gun Club and Fish and Game Protective Association, held at the club house, our attention was called to the fact that dead fish in large numbers were frequently seen along the banks of the streams below Tyrone and Roaring Springs, and that upon investigation it was the unanimous opinion of our informants that this destruction of fish was caused by the poisoning of the water by the refuse from the paper mills, tanneries, etc., located on the headwaters of said streams, being permitted to flow into the same. We were urged to take some action in the matter, and requested to let the result of said action be known to the public in general; therefore, be it resolved:

First—That a committee of two members from the Blair County Branch of the League of American Sportsmen, one from the Altoona Rod and Gun Club, the Tyrone Rod and Gun Club, the Huntingdon Rod and Gun Club, and the Ryde Fishing Club, be appointed to wait on the proprietors of all these industries located on the Juniata River and its tributaries, and request them, in a friendly way, to try and adopt some means to stop the pollution and poisoning of said streams.

Second—That a reasonable length of time be allowed them to complete the arrangements for the purifying of all refuse that is now allowed to flow into the streams, and if, at the expiration of said time limit, they have made no steps to accomplish said result, then instruct said committee to adopt some other means to accomplish their purpose.

Third—That the public in general who have the protection of our fish at heart, be, and hereby is, appointed a committee of the whole to assist in this work.

We would also suggest that each organization pay the expenses of said committeeman while on duty in this capacity.

The secretary is also requested to send a copy of these resolutions to Mr. Meehan, Commissioner of Fisheries, to our local fish commissioner, to our two legislative representatives, to all the above mentioned organizations, to all our local newspapers, and to FOREST AND STREAM.

By order of the executive board Altoona Rod and Gun Club and Game and Fish Protection Association.

W. G. CLARK, Secretary.

Grilse on a Trout Rod.

LARGE salmon begin to run up the rivers of Newfoundland toward the end of June, and the best fishing comes early in July, while the time to shoot caribou is after September 1. Few of us are able to make two such long trips in one year, and fewer still can devote a whole summer to sport, so that it seemed as if we must either take the caribou and regret the salmon, or be satisfied with the salmon and dispense with the deer.

In September of last year I had a very successful trip after caribou, but was filled with longing to fish those superb rivers when their chief glory was on hand for business, so this year planned to reach the island about the middle of August, put in the first two weeks in fishing, and go up to the barrens about the time when the deer were cleaning their horns, so getting a fair sample of each sport.

It was late on August 12 when we reached the Junction River, and early next morning we began whipping that splendid stream, but to our great disappointment three days' hard work yielded only a few trout and one small grilse; so we broke camp and went up Grand Lake, ten miles to Hurd's Brook. Here we found the water very low and no fish of any kind; broke camp again, rowed to the Sandy Lake River, and went up that stream to the first rapid without seeing a fish. I had my trout rod mounted, and cast in every likely place with no rises, so, while the guides were getting ready to haul the dories up the rapid, walked up the stream a few yards and cast again. As the flies circled over an eddy there was a tremendous rush and a gleam of silver, but no touch on the flies. Of course, I should have put on a stronger leader and a salmon fly and waited at least five minutes before casting again, but I was too ignorant and too eager for this, and cast again and again. That salmon rose six times and then went down in disgust and stayed down.

I ordered the boys to find a good place and make camp, and our whole party proceeded to string themselves along that rapid and whip the water. I put a small salmon fly on my light trout leader, went up to the head of the rapid and cast some distance above the first break. Instantly there was a convulsion in the water, a tremendous drag on the line, a leap into the air, and that fish started down the rapid, leaping every few feet, with myself splashing and scrambling through water and over rocks in his wake, while the reel screamed and the little rod bent almost to the breaking point. He bounded gaily past one of my companions, who cast wildly after him, seeing only the fish and paying no attention to the man in tow. Him I ob-jurgated with what breath I could spare and continued my wild career, until my locomotive paused in the big pool below. There he circled, jumping every now and then, while I wound in line and got my breath, and at last drew him slowly toward my guide who stood ready to gaff. For some incomprehensible reason that guide, as the line came close to him, took hold of it; there was a little jerk against his hand, the light leader snapped and my fish was gone.

Such a situation makes one realize how imperfect and inadequate are words for the complete expression of thought; but I did my poor best to be equal to the occasion. My line wasn't touched again during the whole trip, so, perhaps, all was said that was really necessary.

There are four rapids on this stream below the foot of Deer Lake, and there were plenty of salmon in all of them. No larger fish took our flies, only grilse running from three to five pounds, so after the first day we put up the salmon rods and used only our six-ounce trout rods, with one No. 8 salmon fly, double hook—the Newfoundland rivers being so clear that a

large fly is of no use. What sport we did have! We would lose at least two fish out of every three hooked, so we had all the fun and did not kill more fish than could be used, which is the perfection of fishing to my notion.

Black bass? Pooh! Speckled trout? Stuff! Rain-bow trout? Bosh! Grayling? Fiddle! I have caught them all over and over again, and they don't for an instant compare with the acrobatic grilse. The salmon is the king of fish, and to take grilse on a trout rod is as good sport as this world has to give.

A. ST. J. NEWBERRY.

Fish and Fishing.

The Quinnot Salmon in Maine.

THE examination at Washington of the supposed specimen of the Quinnot salmon sent from Pierce Pond in Maine, proves that the fish was simply a large and somewhat unusual specimen of the ouananiche or land-locked salmon, though Colonel Haggard has but little doubt that one of the fish caught by him in that locality was the product of some of the western fish planted in those waters by the Fishery Commissioners. The particular fish sent to Washington was one which had been caught by Mr. Le Messervy, who has camps on Pierce Pond, and the Colonel now regrets that some of the other fish out of the same water were not sent to Washington, for they were, he says, very distinct from the one which has been examined; sufficiently so, in fact, to convince him of the existence there of two distinct species of the salmonidae. Local people seemed to think that the fish resembling that which went to Washington were the stranger fish, however, and the others the ordinary land-locks, and this is how it was that none of the latter were sent for identification. Colonel Haggard tells me that he caught salmon there so very different in all respects from that which has just been declared to be a landlocked one, that he is positive as to the existence of two distinct species in Pierce Pond, though he is unable to say whether one variety is the Quinnot, the steelhead, or what it may be. It is understood that the Maine commissioners have planted both the steelhead salmon and also the Quinnot salmon in certain of their waters, and it will be interesting to note the results. Some of the land-locked variety recently taken out of Pierce Pond are said to have reached sixteen pounds in weight.

The Striped Bass of the St. Lawrence.

Some of the Canadian newspapers have been printing a paragraph relating, as a most unusual occurrence, the capture in a weir, a few miles below Quebec, in the River St. Lawrence, of what they call a bar. Now, the fish known to Canadians as the bar is simply the striped bass (*Morone saxatilis*) of Bloch, and far from a fish of 32 pounds possessing claims to be regarded as of exceptional size, it is a well known fact that this variety of the bass has been known to attain to the weight of 60 and even of 100 pounds. Frank Forrester reports having seen one of 43 pounds, and asserts that they sometimes weigh 70 to 80 pounds, while Dr. Goode refers to one that weighed 112 pounds. Twenty to 40 pounds is not an extraordinary weight for the specimens of this fish which are taken by anglers off the coasts of the Eastern States and of the Maritime Provinces of the Dominion, but it is an undoubted fact that there has been a great falling off in recent years in the size of the striped bass caught in the St. Lawrence River, consequent upon the immense slaughter of immature fish which has been permitted for a long time past. I have seen hundreds of these fish, weighing only a few ounces each, taken out of weirs, and also upon the fish markets of Montreal and Quebec, and until such time as the Federal Government places a limit upon the size of the fish that may be taken or sold, and attends to its enforcement, large specimens cannot, of course, be expected in the St. Lawrence.

Only one of the authors who have recorded the existence of this fish in the St. Lawrence, has referred to the name "bar," which is given it by the French-Canadians. This was Sir John Richardson, in his "Fauna Boreali Americana." Jordan and Everman do not record the occurrence of this fish in the St. Lawrence, though they state that it occurs as far north as New Brunswick, and also occasionally in Lake Ontario. But there is no doubt at all of the bar of the St. Lawrence being the true striped bass. Whether we take into consideration its external appearance, its gameness as a sporting fish, or the quality of its flesh, it is equally desirable. In color it is olivaceous and silvery, often brassy-tinged, sides paler, marked with seven or eight continuous or interrupted blackish stripes, one of them being along the lateral line. It is these stripes or bars which give the fish the name by which it is known in French Canada. Small as is the usual run of striped bass at present caught in the weirs in the vicinity of Quebec, the annual catch amounts to some 10,000 pounds per annum.

Among the islands below the Isle of Orleans, which are first reached at a distance of some twenty-five miles from Quebec, the striped bass is fished for with a troll. The bait used is a small fish, a spoon, or a piece of meat. No rod is employed at this sport, the fishing being done with hand-lines from schooners, and the sport is best during a light breeze. A long and strong line is used, which is thrown by hand to a considerable distance from the boat, with the aid of the sinker attached to it some few feet above the hook. The best fishing is done during the rising tide, and there is every reason to believe that the fish would take the fly in the St. Lawrence, if properly tried, just as they do in the Passaic and at the Falls of the Potomac. In any case there is no reason why the sport of catching the striped bass in the St. Lawrence should not be very much improved by the use of rods and lines in the place of hand-lines only.

Capture of a Big Whale.

One of the biggest captures reported in the St. Lawrence for some time past was reported some days ago from the mouth of the Moisie. A couple of fishermen noticed a large black object out at sea, and putting out in their boats for a couple of miles or so they found that it was an enormous whale, and summoned assistance. The

huge cetacean measured 72 feet in length, and had apparently been killed by sharks, a number of which fought with the fishermen for possession of the carcass, having already bitten several pieces from its body. Ten fishermen succeeded in towing the whale ashore, but eight sharks were killed during the fight for it, several of the savage brutes following the whale right up to the beach, the water where they were slain being colored with their blood. An enormous quantity of oil was made from the carcass of the whale, and now two whaling stations are to be established in the Lower St. Lawrence, fitted out with all necessary appliances for turning the carcasses of whales into commercial products, and to be operated by a joint stock company which proposes to go very extensively into the project. Both the humped-back and sulphur-bottom whales are very numerous at present in the Gulf and Lower St. Lawrence, though the Right or Greenland whale, the most valuable of its species, is now comparatively scarce.

Ouananiche for Hatching Purposes.

Mr. Marcoux, who has charge of the salmon and ouananiche hatchery at Roberval, Lake St. John, has secured about 150 large ouananiche in the Salmon River, a branch of the Ashuapmouchouan, for hatchery purposes. They are now inclosed in a pond and will be stripped some time next month, and their spawn placed in the hatchery. Mr. Marcoux also expects a large lot of salmon eggs from the Tadoussac ponds, which will be hatched out next spring at Roberval for planting in Lake St. John waters.

E. T. D. CHAMBERS.

Fly-Casters and Bait-Casters.

"O scaly Maine, to give me such a deal,
To hand me such a bunch when I was true!"

Editor Forest and Stream:

After reading the article by Mr. Francis L. Green anent "Belgrade and Some Digressions," I decided it was necessary to take the floor, although the first inclination was to treat his communication as "a passing dotty dream." His flobert rifle broadside lacks both aim and penetration, and he should not go gunning again without a guide.

However lowly a citizen the writer may be, it is nevertheless painful to see his name so many times mingled with the "loups of kindergarten chin" and brought into such intimate association with Mr. Green's ego phrases. Especially is this true when the guilty party proves to be one who should be a friend.

Mr. Green has marked me as a fly-fisherman guilty of putting on paper much "self-laudatory vainglory" (please define the phrase) whereas by all the gods I most solemnly affirm that in the article he criticises I posed as a member of the united order of plain pluggers; in other words, the article placed me in the same class among anglers as the gentleman from Pennsylvania, and I have been attacked by what should be a friendly pen. The smoke clouds of his native city have dimmed his vision momentarily and he did not read me aright.

Mr. Green quotes from my article the following: "The gentlemen who have reached this high estate (fly-fishing) can climb no higher in piscatorial altitudes; they can breathe no more rarified atmosphere; they stand on the summit and look down with pity on their brethren who are groping below." He calls this paragraph self-laudation. Now in these lines I attempted to wax sarcastic and my remarks would be labeled as sarcasm (however poor) by any intelligent reader. I did not think it necessary to mark the paragraph, for it did not occur at the time that a mortal of such density as the gentleman from Pennsylvania might exist in the universe at large; however, there is the consolation that a more explicit utterance would have left Mr. Green without the opportunity to over-tax the furrows of his cerebrum, and the world would not have received the benefit of his melodious sob.

I would convey to the dean of pluggers the following impressions; his comments on my lack of wisdom in doing what he is pleased to term, "holding my companions up to public ridicule," are unwarranted; I did not mention names in the article, and if among the many professional men and others who fished at Belgrade there are men who think I spoke directly of them, it must be due to the fact that I spoke truly, and the truth is always a fit subject for publication except where malice is the motive. I have not taken any man's name in vain, much less that of a friend. I have not lost any friends; and at any rate the question broached by Mr. Green is one which can readily be taken up by those concerned without the intervention of any self important personage who would howl over that with which he rightly has no concern. If Mr. Green represents any of the men whose peculiarities I was so unfortunate as to observe, let him speak out, or if, as I strongly suspect, he is an angler with a full knowledge of his frailties, hard hit by some one of the harmless paragraphs I have been guilty of writing, let him declare himself.

Behold the following extracts from the communication of the gentleman from Pennsylvania:

"Bait-casting requires more skill in manipulation than fly-casting. The fly-caster uses his tackle as a whip; the bait-caster has to guide his bait and manipulate his reel delicately at the same time to prevent back-lashing. That is much the more difficult. He also has the same problems to solve with unresponsive fish."

"The fly-caster knows nothing whatever as to what fly his fish will take, or whether they will take it at all. A fly-fisherman is a misnomer. In most instances he should better be designated as an owner of tackle in high-keyed color schemes festooned with some fishing ideas."

"The greater factor (in fly-fishing) is to swell, strut and vaingloriously boast of the fly-fisher's superiority over every other class of fishermen on earth, the bait-fisherman in particular."

Now, I venture to say that the old subject of fly-fishing versus bait-fishing has never received a more valuable and forcible contribution than these immortal

utterances, and that the number of contributions of equal par value is as small as the aggregate of times when Mr. Green has actually indulged himself with fly-casting.

At last the bait-casters have been properly championed by one who is competent to draw comparisons, for has he not "fished with bait and fly?"—yes, side by side, worm on one hook, fly on the other, joining hands for a common purpose, floating down through the ripples.

"The fly-caster uses his tackle as a whip." How wonderfully doth the gentleman of experience deal with the subject of fly-casting in this short, weighty sentence. By this line alone we realize that the hand of a master is revealed to us. This pregnant statement entitles Mr. Green to the seat in the hall of fame rendered vacant by his removal of Izaak Walton therefrom, and I would respectfully suggest that he at once be given a reclining chair therein, and that over his head there be emblazoned those soulful words: "The fly-caster uses his tackle as a whip."

Taking the sentence as a text, and inspired and spurred on to zealous effort by the rest of Mr. Green's heart-burning remarks, I would take up the cudgel after him and, in my poor way, follow in the road which my brother plugger has already macadamized and illuminated, and attempt to amplify, and bring out the hidden wealth and beauty of his remarks.

"Lay on, old pard."

Brother fly-caster, even as the rustic, with his larch pole idly plays it over the back of lean Pegasus, or failing to rouse the plodding horse, tickles him gently by the withers, or flays him roundly on the ribs, so dost thou angle with thy light rod and line and flies, using thy tackle as a whip; verily, and in truth dost thou whip the water, using the line and the flies thereof as a lash, and the most delicious moments of thy pleasures are thus spent in snapping the whip. Infancy can ply thy tackle, for is it not but whalebone in thy hand?

That dean of pluggers and sage of all fish craft, Mr. Green, of Pittsburg, and myself know that this is the epitome of your craft and that the "greater factor" of your art "is to swell, strut and vaingloriously boast of the fly-caster's superiority over every other class of fishermen on earth, the bait-fisherman in particular." "The bait-caster has to guide his bait and manipulate his reel delicately, at the same time to prevent back-lashing." This is much the more difficult. It is a mere nothing to get out sixty or seventy feet of enamel line smoothly and evenly, so that the flies fall gently on the water, and to do it time and time again with graceful action and wrist movement; nothing to overcome the difficulties of casting where there is no room for a back cast. There is no skill displayed in casting under obstructions or in dropping the flies at the edge of the foam. All this and more is merely child's play—the using of your tackle as a whip. As you "know nothing whatever as to what fly the fish will take, or whether they will take it at all"—there is no need for your varied assortment of flies—any bunch of poultry down on any old hook, annexed in any old way, will do as well—the more down on the hook, the merrier the snap of the whip—thus says the dean of pluggers, and thus say I, his ill-used contemporary.

But now for the contrast—bait-fishing, the "delicate art"—it is much the more difficult, for you must "guide the bait" and "manipulate the reel delicately at the same time to prevent back-lashing." True, in fly-fishing you do a little back-lashing and all around lashing with your tackle as a whip; but that is nothing compared to the skill employed in thumbing the reel to prevent the line from falling over itself in its anxiety to be out and doing. Think of the mental calculations to be indulged in telegraphing to be done by the brain to the various voluntary muscles operating the thumb, so that the frog may be gently guided in his journey through the depths of air, to fall at the precise spot on the edge of the lily pads, where his arch enemy awaits the splash; a few feet less in the cast or a slight divergence from the spot fixed upon would not have brought the result, for the splash and the bait are so invisible and inaudible.

Then think of the various baity problems that the tired brain must solve; whether to use brook minnows or shiners, speckled frogs or green frogs, helgramites or crawfish, crickets or grasshoppers, and so down the scale; whether to hook the frog in the upper or lower lip or in the left floating rib or through the flipper, whether to impale the minnow through the lip or by the tail and, last, but not least, the knotty problem wrapped up in the worm—blood-worm, dug-worm and the shifty, lusty night-walker—where to hook him, how to hook him, how many to place on the hook and the proper amount of squirm and wriggle. Think of the patience required to fish beside your neighbor with a substantial amount of bait in your boat but no fish, and to find that the fish are feeding well on his plantation but are not even grazing in your pasture; you ask him what bait he is using, and he replies, cock-roaches, an animal which heretofore you have left off your bait list. Then again, when the fish goes for "any old bunch of feathers" he grabs it right before your eyes, and you know just when to snap the whip. But in bait-fishing, when your frog disappears below the surface and strolls over the bottom it takes a past master at the art to tell what is doing; whether he has tied himself to the bottom or gone to sleep under a log, or whether he has been grabbed by a bass. When you are sure he has been grabbed, then to determine when the psychological moment for the long and strong pull has arrived. The delicate sense of touch by which the bait-fisherman is able to tell just what his quarry is doing, and the deep finesse and false cord play by which a timid nibble is nursed into a lusty strike are the developments only of much seeking in the field of bait-fishing.

Then again, my brother fly-fishermen, do not think that it is an easy task to get to that point in bait-fishing where you can adjust baits of all varieties on your hook without a quail; it is easy with the worm, for he is meek and lowly and makes but small appeal to humanity, but let me say that you who whip with the airy-fairy, inanimate and artificial fly (be it the spinach

from the bosom of an aged Plymouth Rock or the feather of a strutting jungle cock), know nothing of the anguish of the soft-hearted bait-fisher, when, with hook in hand, he for the first time gazes into the mute appealing orbs of a struggling batrachian, while his own lachrymal glands threaten a deluge, and a lady member of the C. P. C. A. throws a glance that Tommy-hawks his soul.

Still, again, fly-fisherman, while a fly-book is the sole baggage of your trade, our implements of fishery are so multitudinous that we must perforce lug around a small tin trunk. I would speak now of the tackle box with its lacquered sides and gold-leaf, filled to overflowing with sinkers and a host of needed chattels and the disgorged, that saver of life, the bait-fisherman's right bower; that revealer of the innermost secrets of fish, a saver of hooks; on horn-pouts and pickerel a necessity, on bass very useful, especially below the epiglottis; as essential to the bait-fisher as the ax to the woodsman.

And lastly I would present to the fly-fishing fraternity the subject of bait-casting with artificial baits, and here some absent treatment tells me that I will gain a fervent amen from the dean of pluggers. The art of bait-casting reached its highest point of development of recent years with the advent of artificial baits, or, rather baits which resemble nothing in particular, but are creations following the whims of their makers or exponents. Even as the first artificial flies followed the colors and form of the natural insects; but later-day "killers" resemble no insect on earth, so in baits we have progressed by easy stages from artificial minnows and frogs to minnows of gorgeous raiment and goo-goo eyes, and from this point to any old doodle-bug, until now the highest achievements of the maker's art are exemplified by such wonderful baits as the Yellow Kid and the Shifty Sadie, and animated clothes-pins, bristling with double and treble hooks, in bunches and in clusters tied on, glued on and stuck on. Baits of tin, aluminum, bronze and boiler plate, of glass, celluloid and wood, built on torpedo boat lines or following the model of a Havana perfecto, all warranted to allure, tempt, attract and arouse all the latent ire and fighting qualities of our game fish, and guaranteed to hook the fish if he comes within six inches of the tentacles, and if he should lucklessly close his jaws on any of the tin ware, \$1,000 reward is offered by the makers for an instance on record where a fish has actually escaped and survived the ordeal of resisting the hooking qualities of "de gangs."

Brother fly-fisherman, it takes an artist to cast one of these half-pound conglomerates; 'tis easy to whip the water with your flies; but think of the muscular energy necessarily developed by the good right arm when your bait-caster literally swats and trounces the water with a quarter section of enervated junk; a swing to port, a screeching lunge to starboard, and for a few seconds the destroyer pirates over the calm surface of the lake, on even keel with all guns bristling. Woe to the luckless enemy who dares to cross its path or even flirt with its rudder; his death is as certain as a tax on real estate! While you are content with flies of early make, in use for many years, such is the strident nature of our art that each spring brings us a coop of new devilties, thicker and more varied than Easter bonnets. For your coachman we have the coxer, for your yellow May the yellow kid, for your Parmacheenee-belle the immortal Bedelia (long suggestive of the undertaker), and a small army of lesser lights, among which may be enumerated the bugaloo, the soaker, the Cinderella, the killer and the Susan nipper, each in its proper sphere, and one and all the embodiment of ideas which chase themselves in our dreams and disturb the tranquility of our slumbers like goats upon a tin roof.

It has taken much from this flighty pen to attempt a portrayal of the beauties of bait-fishing and to assail the fly-fisherman in his citadel. Mr. Green has accomplished more by a few short paragraphs. I hope, however, that I am not altogether "small change in Mamie's scorn." We may some day join hands and collaborate on this great subject.

KENNETH FOWLER.

Square Tails of Portage Lake.

SOUTH ORANGE, N. J.—*Editor Forest and Stream:* I thought it might be interesting to the readers of your paper to know that in August, while staying at Oak Point Camp, Portage Lake, Me., my brother, Stanley Babson, 12 years of age, caught on rod and reel a 6¼-pound square-tailed brook trout. This fish was the largest of that variety ever taken in that vicinity, measuring 26 inches in length. I was in the boat at the time, and our guide was Henry McCormack, of Portage, Me. The fish was not particularly gamy, considering his size. There are many large trout taken in this locality, but anything over 5 pounds is an extreme rarity. I understand that further up the line of the B. & A. Railroad, at Square Lake, larger trout are sometimes taken. I note a record of two square-tailed brook trout, 9 and 7 pounds, respectively, taken in this locality. These fish were spoken of as the two largest ever taken in northeastern Maine. Can you inform me as to the validity of this report, and whether the fish in question were taken on rod and reel? Of course I understand that much larger square-tailed trout are taken from the Rangeley Lakes.

CLIFFORD R. BABSON.

"Of Second Nature."

BOSTON, Mass.—I have taken FOREST AND STREAM from the first number issued, as well as Rod and Gun from its start to its merging with FOREST AND STREAM, and have complete file to date. It has become a habit of second nature for me to look for its arrival; and I enjoy its columns as of yore. I have a curiosity to know if you have many names on your list that have been there constantly from first issue of Rod and Gun and FOREST AND STREAM? With best wishes for future prosperity of FOREST AND STREAM, I am

C. W. CHAMBERLAIN.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

The Nose as a Bait.

L. Roy, member of the firm of Roy & Roy, is home from a trip to his old home in eastern Canada. Mr. Roy says that he had some great fishing while away, catching one day several pickerel in the St. John's River, one of them being over three feet long. "I can tell you a fish story that some people won't believe," said Mr. Roy, "but I'll swear it's true. A man and his twelve-year-old son were fishing in the St. John's while I was there. The boy was leaning over the side of the boat peering into the water, when a maskinongé, seeing his nose touching the water, and thinking it a bait, made a run for it and grabbed the nose. The boy yelled and threw himself back into the boat, pulling the fish with him. I saw the fish, and it weighed 15 pounds. I saw the boy, too, and he had his nose wrapped with bandages and plasters, the fish's teeth having lacerated the member badly. Aside from a very sore nose and being badly frightened, the boy was all right when I saw him last."—American Lumberman.

The Kennel.

National Beagle Club of America.

Editor Forest and Stream:

The Fifteenth Annual Field Trials of the National Beagle Club of America will be held at Mineola, Long Island, during the week commencing October 31, 1904. The headquarters of the club will be at John's Hotel, Mineola, L. I.

Premium lists, entry blanks, and full information relating to the trials will be forwarded to anyone upon application to the undersigned.

CHARLES R. STEVENSON, Secretary.

Points and Flushes.

Dr. H. B. Anderson, who a few years ago devoted his attention to dog training and handling for a time, and then returned to his profession, has decided that, owing to the need of a more healthful occupation, he will resume training again, a vocation in which he made a distinguished success. He will locate at Girdletree, Md., where he will be pleased to receive dogs to train. Dr. Anderson is well and favorably known as an expert trainer and reliable gentleman.

Canoeing.

Officers of A. C. A., 1904.

Commodore—C. F. Wolters, 14 Main St. E., Rochester, N. Y.
Secretary-Treasurer—John Sears Wright, 519 West Ave., Rochester, N. Y.

ATLANTIC DIVISION.

Vice-Commodore—W. A. Furman, Trenton, N. J.
Rear-Commodore—Frank C. Hoyt, New York.
Purser—Chas. W. Stork, Trenton, N. J.
Executive Committee—Louis C. Kretzmer, New York, N. Y.; Edward M. Underhill, Yonkers, N. Y.; J. C. MacLister, Philadelphia, Pa.
Board of Governors—R. J. Wilkin, 164 Montague St., Brooklyn, N. Y.
Racing Board—H. L. Quick, Yonkers, N. Y.

CENTRAL DIVISION.

Vice-Commodore—H. W. Breitenstein, 511 Market St., Pittsburg, Pa.
Rear-Commodore—Frank D. Wood, Buffalo, N. Y.
Purser—Frank C. Demmler, 526 Smithfield St., Pittsburg, Pa.
Executive Committee—Jesse J. Armstrong, Rome, N. Y.; H. C. Hoyt, 26 S. Goodman St., Rochester, N. Y.
Board of Governors—C. P. Forbush, 164 Crescent Ave., Buffalo, N. Y.
Racing Board—Harry M. Stewart, 85 Main St. E., Rochester, N. Y.

EASTERN DIVISION.

Vice-Commodore—Henri Schaeffer, Manchester, N. H.
Rear-Commodore—H. M. S. Aiken, 45 Milk St., Boston, Mass.
Purser—Edw. B. Stearns, Manchester, N. H.
Executive Committee—B. F. Jacobs, Jr., West Medford, Mass.; D. S. Pratt, Jr., Wellesley Hills, Mass.; Marcus Butler, Lawrence, Mass.; William W. Crosby, Woburn, Mass.
Board of Governors—Paul Butler, U. S. Cartridge Co., Lowell, Mass.
Racing Board—Paul Butler, U. S. Cartridge Co., Lowell, Mass.; H. D. Murphy, alternate.

NORTHERN DIVISION.

Vice-Commodore—Chas. W. McLean, 303 St. James St., Montreal, Canada.
Rear-Commodore—J. W. Sparrow, Toronto.
Purser—J. V. Nutter, Montreal, Canada.
Executive Committee—C. E. Britton, Gananoque, Ont.; Harry Page, Toronto.
Board of Governors—J. N. MacKendrick, Galt, Ont.
Racing Board—E. J. Minet, 125 Vitre St., Montreal, Canada.

WESTERN DIVISION.

Vice-Commodore—Burton D. Munhall, care of Brooks Household Art Co., Cleveland, O.
Rear-Commodore—Chas. J. Stedman, National Lafayette Bank Cincinnati, O.
Purser—Geo. A. Hall, care of Bank of Commerce, Cleveland, O.
Executive Committee—Thos. P. Eckert, 31 West Court St., Cincinnati, O.; Dr. H. L. Frost, 10 Howard St., Cleveland, O.
Board of Governors—Henry C. Morse, Peoria, Ill.

How to Join the A. C. A.

From Chapter I., Section 1, of the By-Laws of the A. C. A.: "Application for membership shall be made to the Secretary, and shall be accompanied by the recommendation of an active member and by the sum of two dollars, one dollar as entrance fee and one dollar as dues for the current year, to be refunded in case of non-election of the applicant."

A. C. A. Executive Committee Meeting.

To the Members of the Executive Committee, Board of Governors and Racing Board:

The annual executive meeting of the American Canoe Association will be held at Rochester, N. Y., October 15, 1904.

C. F. WOLTERS, Commodore.

JOHN S. WRIGHT, Sec'y-Treas.

Sawennishat C. C.

In the early spring of 1903, nine of the charter members of the Sawennishat C. C. purchased the eight-acre tract of land on the west shore of Irondequoit Bay, known as the Edgerton property, with house, barn and other buildings. It is without doubt the most beautiful spot within many miles of Rochester, being entirely under timber, the most of which is pine and chestnut, situated in a valley through which runs a stream of clear spring water; hills on either side rising to the height of 150 feet. After the purchase of the property, the nine stockholders with eight others incorporated the Sawennishat C. C. The house being too small for the requirements of the club it was enlarged; a new spring

was struck which flows 18 cubic feet during the dry summer months. New docks were built and new grading had to be done, all of which was not completed until the first of June, but on Decoration Day, 1903, the club house was formally occupied. The club house, while not of as elaborate construction as some of its neighbors, is as convenient as it was possible to make it. The lower floor, or cellar as it is called, is used as a boat room, having a dirt floor, which is of great advantage in not allowing the boats to dry out during the winter months that they are not in use. In front are double doors opening on a long canoe dock; along the side of the room are lockers for the sailor men. The second, or main floor, has a veranda 64 feet long, running across the entire front and extending along either side. On this floor is situated a large living room,

dining room, kitchen, men's bunk room, locker room and shower baths and steward's quarters. The large bunk room runs the entire length of the western side, having windows on three sides, giving perfect ventilation on the warm summer nights. On the third floor are to be found the private rooms for the married members, and bath and toilet.

The season of 1904 was a very prosperous one, and very gratifying to the promoters. There are several names before the club for election and the prospects for the coming year are very bright. The house is kept open the year round and in the winter there is skating, tobogganing and other winter sports. The club is limited to twenty-five members. The officers are: S. G. Raymond, Commodore; C. E. Hoyt, Vice-Commodore; W. H. Sampson, Purser.

YACHTING

A Cruise on Lake Ontario.

THE man who undertakes to write an interesting account of a summer cruise on Lake Ontario starts with a bad handicap. Our cruising conditions are usually so favorable that the only chance of securing incidents to make a spicy yarn is to start on your voyage with a badly found boat and an incompetent crew. Given a leaky boat, worn out rigging, rotten sails, and a crew cheerfully careless of harbor lights, buoys, and charts, you have a fair chance of leading a life of startling adventure and hair-breadth escapes; but given a "right little, tight little" vessel, a canny skipper and a good crew, life afloat is apt to be monotonously safe and uneventful.

The little vessel whose adventures I am about to relate is an excellent boat of her type. She was designed by Mr. W. P. Stephens. With a waterline length of 18ft. she has 5ft. 9in. beam, 3ft. draft, and is 21ft. 9in. over all. On her keel she carries 1,000 pounds of iron, and swings aloft in a yawl rig about 300 sq. ft. of canvas.

The crew of Lorna on this present trip to the Bay of Quinte comprised the Skipper and his good friend Watty, who had acquired a thorough knowledge of seamanship in the course of some three years' experience on the half deck of a large ocean vessel. Now, to begin at the beginning, Watty had signed articles to appear at the Union Station, Toronto, at 9 P. M., Friday, July 1. The Skipper, according to promise, met the train, and soon sighted a pale-faced apparition steering through the crowd with a fast returning nautical roll.

"Watty, ahoy!"

"Ay, ay, sir! Just reporting for duty, sir."

"Good! Port your helm, Watty, and we'll steer for York street bridge and then straight down to the water front."

Our course lay down the Royal Canadian Y. C. dock to the end of Noverres' row of boat houses. "Now," I said, "I'll show you the boat," and as I spoke there burst upon the gaze of the man who had walked the half deck of the 225ft. ship a vision of the little Lorna. There she lay in the half light, white, slim, and graceful, with bare spars and clear decks all trim and neat, for every stitch of canvas is taken ashore when not in use. He used half admiringly, half distrustfully, then said: "She's pretty small, isn't she?" "Yes," I replied, "but yachts are like wives—the comfort you derive from them is not always expressed in terms of their size. Much depends on quality and how well they are managed."

Watty grinned acquiescence, and we turned into the boat house to gather together our dunnage and store it on board.

It was nearly midnight ere we finished, for the essence

forward end of the cabin, against the after side of the mast, stands the tool chest, well equipped with essentials for repairs to hull or rigging. The cabin has a fixed starboard bunk and a folding port bunk. The boat having a standing keel, this arrangement gives plenty of foot and leg room in the cabin during the day. The table is formed of a light plank suitably stiffened. One end rests, when in use, on a ledge of the after cabin bulkhead, and the other end is supported by a line passed through two holes in the plank, eyes spliced in the ends of the line being slipped on to hooks in the cabin top. The table is thus easily adjusted to and from the fixed bunk, as suits the crew's convenience.

Our labors ended, Watty squatted on the bunk beside

PRESQU'ÎLE POINT LIGHT.

me, swept his eyes from end to end of the cabin (6ft.), and expressed the opinion that he thought he was going to enjoy himself. He then stripped off his outer garments, rummaged in his dunnage bag, and dragged to light a gorgeous suit of striped pink pajamas. "Oh, ye gods and little fishes! Has it come to this, that the crew, the deck hand and ordinary sea cook must swell it thus before the captain's eyes in roseate splendor, like a bifurcated radish on a spree." The pink pajamas soon disappeared between the blankets, the Skipper followed suit, and all was peace.

The sun rose next morning about 5 hours 5 minutes, and 10 minutes later Lorna cast off her lines and slipped out into the bay before a light land breeze. Out in the lake the land breeze soon left us, but we had small opportunity of bemoaning our luck, for a light S.W. breeze soon sprang up, and all hands settled down for what promised to be a lazy all-day sail to the N.E.

Real gales are very infrequent in summer time on Lake Ontario, and, as heavy winds have usually a good deal of E. or W. in their direction, the danger of being caught on a lee shore may be disregarded with any kind of a weatherly craft. Coasting, therefore, is perfectly safe, and the only object in keeping a fair offing is to make the most of light breezes off the lake, which may become very soft close inshore.

There is nothing exciting in a quiet sail on Lake Ontario on a bright August day, and yet nothing is more enjoyable, particularly on a first day out when the fresh glow of anticipation puts one in a particularly happy and appreciative mood. A light breeze, too, if a fair breeze, speeds a boat merrily on her way. The bold Scarborough bluffs gradually slipped by; the Gothic pinnacles of the Dutch churches carved by wind and water on the face of the escarpment; Port (?) Union, the mouth of the Rouge, and Frenchman's Bay, one by one dropped behind as the day wore on, till round a point ahead Whilby lighthouse hove in sight. But to-day we will have none of Whilby, and with spinnaker drawing we pass it by, with the crew, stripped to his pajamas, dancing hilariously on the cabin top, and casting a rosy radiance over his immediate surroundings.

Port (?) Oshawa comes next, marked on Lorna's chart "L. F., white." Inquiries on a previous occasion disclosed the fact that the fixed white light consisted of a lantern hung on the end of the dock when a vessel was expected to call. Harbor there is none. Next Raby Head looms up, a bluff big and bold, its feet buried beneath a chaos of boulders hidden beneath the lapping waters of the lake.

By 5 P. M. Darlington lies abeam, surely a place of strong religious tendencies, for the lighthouse resembles more a little white church with exaggerated belfry than the Mecca of dock-wallopers and longshoremen.

Now our good sou'wester failed at last, and slower and yet slower moved the boat, till we lay idly rocking on the swell. Watty looked disconsolate, till I reminded him that exercise was what he came for, then without a grumble he dropped into the dinghy and towed us into Newcastle harbor. This little harbor is a very good place. A few stonehookers seem its only vehicles of commerce, and the occasional calls of the steamer Argyle the only suggestion of the world "which amuses itself." There are, of course, a few summer cottages near the lake, but the yachtsmen does not feel that they make any undue inroads on his privacy. That evening, while Watty smoked his pipe, the Skipper wrote up his log, and with much satisfaction ticked off 46½ miles to the good.

Sunday changed the program; the lazy run before the wind gave place to a day of wind-jamming in a light to moderate breeze. In such a wind trim sheets to a nicety, give her a free rein, and Lorna will jog herself along to windward in a most independent fashion, while the crew indulge in converse high, or even woo the god of slumber.

A boat of moderate form and moderate ballast, like Lorna, is a most comfortable sea boat, and shoulders through a head sea in an easy manner quite astonishing to those accustomed to the thundering jar with which the exaggerated bow of a modern racer takes the rhythmic sapphire ridges.

A gray day this was, with hints of coming rain, and the rolling fields and hills along shore seemed cold and sombre. The wind being in the E. gave us a long leg alongshore, and a short leg out into the lake, weltering blue-gray to the misty horizon. This sort of work in a light breeze is somewhat slow and about two miles an hour to the good seemed the best we could do. Early in the afternoon Port Hope came abeam, a small well sheltered harbor, but not our goal. The pretty little town of Cobourg, lying five miles further to the E. suited us better, so still we kept at our unceasing zig-zag. The Gull light we passed to port, giving a wide berth to the rocky shoal on which it is built. All around is plenty of water, but out here a mile and more from shore lies this solitary rock, something unique in this end of our beautiful lake. The Gull past, Cobourg seems practically attained, and by 5:30 P. M. we were slowly sailing by its piers into the inner harbor, which is very small but very snug and quiet in any wind.

Monday morning awoke great expectations on board, for our anchor must remain on deck till Presqu'île at least

"HER DAY'S WORK DONE."
Old Schooner in Presqu'île Cove.

LORNA.

of comfort on a small boat is proper stowage, and that takes time and thought. Then, too, the canvas had to be sent on board and got in shape ready for hoisting, for we contemplated an early start on Saturday morning.

For stowage, Lorna has the forepeak, which is in continuation of the cabin; the space under the cockpit, into which various boxes are slid, and the spaces under the deck around the cockpit. As the latter is merely a water-tight tray drained to the sea, these spaces are open to the cockpit and very easy of access. In the forepeak the blanket rolls and dunnage bags are stowed, and at the

be reached, some 24½ miles to the E. Then one is at the gateway of the famed bevy of Quinte.

By 7 A. M. we were once more out in the lake hammering away against another E. wind, too light and too nearly dead ahead to promise a port before dark. The afternoon was upon us ere the W. end of the low ridge of hills which forms the northern sky line of the western part of the bay began to lift into clear view. There, too, ahead of us certain tree tops begin to peep above the eastern horizon, steadily growing in clearness and size till Watty is prepared to swear it is an island. But, no;

it is only the west end of the head of the peninsula forming the west side of Presqu'ile and Brighton harbors.

The evening fell, and a reddening of the western clouds told us the sun had set. With the growing dusk the E. wind freshened and hopes of a night in port revived within us. Then darkness almost completely closed about us, utterly shutting out the great world. It was small wonder that the growing darkness, the whistling wind, and the dangers of making a difficult port in the darkness of night induced in Watty a slight feeling of nervousness, for to him all this was new. But we are not entirely alone. There to starboard blinks a distant yellow eye. Ah, the Scotch Bonnet! Then to port shines out a nearer glare—Presqu'ile Point light—white, strong, and steady. Toward the Presqu'ile light, and toward the hidden dangers of the Presqu'ile rocks and shoals, we slip along. To pick up Presqu'ile range lights was an absorbing occupation. Ahead to the E. there glimmered a red and a white light. "Looks like Weller Bay," muttered the Skipper; "but still, if they are not the range lights, where in Sam Hill are the range lights? Go forward, Watty, and keep your eyes peeled." We were now on the starboard tack, and Presqu'ile light was hidden from the Skipper by the mainsail. The red and white lights looked so desperately far off that doubt and uncertainty filled his mind. Suddenly Watty hailed, "White light showing, apparently E. of Presqu'ile light." "Ay, ay, Watty! Now we have it," and the Skipper quickly eased off sheets a bit and bore away for the shy twinkler.

Nearer and clearer grows the first range light. There beyond it to the N. is another white light, and beyond that again a red light. Our course is now clear. Keep the white lights in range till the first glides by to port; then keep the second white and the red in range till the second white is passed to starboard; after that either run on N. and anchor near to Brighton piers, or turn to starboard round the second white light and head for the white light marking the channel to the mouth of the Murray Canal.

Our choice was to lay at Brighton, and so about midnight, after a dashing sail up the bay, our anchor rattled down to the bottom in about 10ft. or 12ft. of water, close to the N. shore.

Morning broke heavy and gray, with clouds and mist, anon thundering bursts of driving rain upon us. Late hours at night meant late hours in the morning, and after a late breakfast the crew manifested no undue anxiety to get under way. Toward noon the Skipper tired of inaction, and gave the word "On to Trenton, rain or no rain," and the crew responded with alacrity. A moderate S.E. wind was blowing, enabling us to nicely lay a course for the mouth of the canal. The rain soon ceased to fall, but the wind gradually increased in force.

Once inside the canal, trouble began for the Skipper. The wind was then blowing hard, but the banks of the canal and various groves of trees at times stopped the breeze, and made the sailing most exasperating. Now the wind comes free, then dead ahead; now a zephyr, then suddenly a howling gale. Now we glide along the canal pointing our course, then a foul puff comes and we edge nearer and nearer the sharp stones of the northern bank. "Ready about!" shouts the Skipper, and away we shoot on a short leg of 60 or 70 feet to the weather side. About again, we start once more a long diagonal toward the northern bank. This style of work is varied by the excitement of hauling and passing four swing bridges, an exchange of compliments with the west-bound Mackinaw Tainui, and the receipt of a few remarks on the pleasure of yachting from facetious farmers driving along the tow path.

At last we reach the piers at the E. end of the canal, and swing out into the Bay of Quinte, which a look at the chart will show to resemble almost anything but a bay. On its dark waters, among its wooded islands, and past its many outreaching points, we were now to do our sailing, and while I think of it, take this lesson to your heart—"Buoys wherever found must be carefully followed." If you think you can neglect them with even 3ft. draft, you are mistaken. Between the canal and Trenton a long shoal is marked by three red buoys, which must be left to starboard.

By 4 o'clock we had anchored off Trenton, with the wind still strong from the S.E., and a dirty looking sky overhead. Our hook was hardly down before a large sized, weatherbeaten, serge-clad individual rowed out from the town and announced himself as the "Commodore." He further informed us that our position was not a good one, as the wind was likely to "blow like h— from the S.E.," and advised us to come inside the new cold storage dock. We did so, and found a very snug little spot where we lay with our bow to the dock and a small anchor over the stern. While the Skipper was dropping the anchor, the "Commodore" dropped a pair of huge legs down the hatchway, and surprised Watty with a request for "Some good Scotch whiskey or Canadian would do on a pinch." He got some Canadian, and then, puffing at one of Watty's Pittsburg stogies, proceeded to enlighten us on the failings of well-known yacht skippers and on the manner in which he had tendered good advice to some of them. We are now inclined to think that possibly his advice to us was not altogether disinterested, and perhaps not even necessary.

Trenton is noted as the possessor of an antiquated stable serving as a bridge over the Trent River. This bridge is covered in and has hogged and sagged in so many ways that in profile it is a good deal like the street in Damascus "which is called straight, and which is a little straighter than a corkscrew, but not quite so straight as a rainbow." Trenton has another specialty—a rather high, steep, round-topped hill just at the back of the town. Watty asked a bright looking boy what the name of the hill was. "What hill?" said the boy. "Why that hill," said Watty, pointing with his finger. "That? Oh, that's the mountain," was the reply.

The morning was again dull, cool, and spitting with rain. The wind was fresh from the S.E., but in such sheltered waters the sea, though choppy, was not heavy enough to interfere with speed in windward work. One reef in the mainsail seemed to provide comfortable sailing, so we turned it in and poked our nose out into the open. The course is plain, but "watch well the buoys." One large black cutter evidently had not, for she was being ignominiously towed westward by a snorting tug,

while a man aft kept jerking spouts of clear water out of a large tin pump with its suction end stuck down the hatchway.

This was a day of lively close-hauled work, the boat just laying her course and keeping the land slipping by at about a four-mile gait. Ten miles seem to vanish in no time, and there is the long stretch of Belleville bridge. Watty sends a melodious sea bellow floating off through the megaphone, and grudgingly the bridge keeper opens up enough to let us corkscrew through. A couple of miles further on we pass Massasauga Park and enter Big or Hall Bay. Here the wind has a wider sweep, and getting lunch proved no easy task for Watty, for the boat was lying down to her work, and prancing in most lively fashion.

At the east end of the big bay on the Prince Edward side is the village of Northport, and aft it lies a shoal marked by four red buoys. Now the bay narrows again, and we pass a lighthouse on a little island which gives the range with Belleville light. Then looms up the tall sawdust burners of Deseronto, and the gay summer cottages on Forester's Island.

If your draft is very light you may turn south through the channel west of Forester's Island. With 3ft. or over, take the E. channel and keep outside a buoy near the S. end of the island.

Just before we reached Forester's Island the wind piped up with an ominous whistle in the rigging, and a waving and bending of the trees ashore. A second reef was tied down in the mainsail. Then the mizzen and big jib came down, and a storm jib went up instead. This canvas we held till well S. of Forester's Island in the lovely reach stretching down to Picton, some twelve miles away. To have the pleasure of this sail, it is worth while braving many trying storms and exasperating calms. The water is clear and deep; the banks rise high on either side, robed in many tinted green. Here summer cottages peep through the trees close to the water's edge; there a fresh green cultivated field creeps down the side of a slope.

Now the wind begins to free and fall lighter, so little by little we spread wider wings to the blast, and the patent log clicks a merrier tune. Hay Bay opens up to port and allows the wind a fairer sweep than ever, and faster and yet faster we speed on our way. Watty holds the watch on the log. "What is it, Watty?" "Six just," comes the answer. Now we open up Adolphus Reach stretching away to the E. toward Kingston, and the wind frees yet a trifle more. "What says the log now, Watty?" "Six point three," replies Watty, and so we speed down the cul-de-sac of Picton Bay and drop anchor at 8:05 P. M. in the snug little harbor close to the E. shore. The Skipper enters in his log, "Forty-four miles run; time, 11 hours."

No hurry the next day, as our goal—McDonald's or Prinzyr Cove—is only 15 miles away. So leisurely we "do" the town of Picton, renewing stores and patronizing the post-office. Then with a fresh S.W. wind we run N.W. for Glenora, with one reef in the mainsail. A large open boat starts before us, and afraid, apparently, to run dead before the wind, zig-zags up the bay. We, too steady to fear rolling with free sheets, steer straight as a die and steadily drop the sloop. Soon the little belfry of Glenora church appears high on the sky line around the corner, and we swing E. along the S. shore of Adolphus Reach. In a few minutes we are close upon the stone mills of Glenora, and drop anchor close inshore W. of the dock. Offshore the water is very deep, but those who prefer may tie up at Glenora dock.

Of course we climb up the fine road leading to the top of the height, and seek the celebrated Lake of the Mountain. Picture to yourself a clear, emerald green lake, several hundred acres in extent, set up here high above the bay, the nearest thing to heaven of all around it save the trees. Out of it all day long pours a steady, never-failing flow driving the whirling turbines of the mill below. Days and months may pass, seasons change and years roll on, but still the little lake fails not nor overflows. From the bay side edge of the bluff a splendid panorama spreads out before one. To right and left stretches out Adolphus Reach, with rippling squalls streaking its dark surface. In front lies Glen Island, and off beyond that a silvery shimmer glints through the trees from some of the ramifications of Hay Bay.

But time passes, and we hurry down to our boat to get away for the cove. The next hour and a half was filled with excitement. The wind was heavy and dropping in gusts over the edge of the southern bluffs. Right over the quarter it came, so two-reefed mainsail and whole jib seemed to suit our needs. Not large canvas, but more than enough when a big slaty cloud rolls up overhead, throwing a chill shadow before it and carrying underneath it a dancing shimmer of white. A few spits of rain and then a stinging gust that buries our lee rail and sends us staggering on. A word to Watty sends him forward to drop most of the mainsail, leaving the peak set up between the lifts. Both squall and rain are soon over, and once more we are speeding on our way at a 6-knot gait, and rapidly nearing the E. entrance of the bay. There ahead is the low outline of Amherst Island, and here to starboard the entrance to the cove, hardly suspected till right at hand.

No one could ask a better harbor. A lovely arm of the bay runs inland about a mile with a greatest breadth of less than a quarter mile. The water is deep right up to the shore, and the wooded banks show scarce a sign of human habitation. On the E. side stands a storm signal station, for this is an important harbor of refuge, situated as it is at the extreme N.W. corner of Prince Edward county, with no outside harbor nearer than Kingston. Here we lay quietly till Saturday morning, enjoying to the full the natural pleasures afforded.

Saturday morning we resumed once more the strenuous life, and entered into a wild battle with a W. gale. Reduced to two-reefed mainsail and storm jib, we glided out of the cove and into the fierce chop and whistling squalls of the reach. But, oh, the wild exhilaration of it all! Hatless, with wind-blown hair and spray-wet faces, we bucked into it, the while wind and sun seemed to soak into the very marrow of our bones.

A call at Cressy dock for letters varies the excitement. Inshore we run on the starboard tack close under the lee of the dock; then about and a quick shoot up into the wind just at the corner. Watty, watching his chance, makes a spring, carrying a line with him, and I see him

frantically clawing at the edge of the dock, like a cat trying to climb a brick wall too high for it. But he succeeds at last, and drawing himself on top takes a hasty turn round a snubbing post. "Nearly missed it," he cried. Then he started off for letters. He subsequently explained that the full force of the gale caught him right in the face just as he struck the dock, and came within an ace of dropping him in the briny.

Off once more, and this time with an added excitement. A big three-masted schooner under lower canvas has come into the reach, and there, a mile away to leeward, is tackling the same herring-boning contract we have in hand. Tack after tack we watch her. Quicker in stays than she and outpointing her, we just about make up for her superior footing. As we near Glenora the wind backs a little, and we soon find we have a short leg to the S. and a long leg on our way. The schooner likes this better, and crawls up a little. Now the wind backs right into the S., and we joyfully ease sheets and speed W. with added life. The schooner draws yet a little nearer. Watty eyes her glumly, and fervently wishes the wind would drop a little, so that Lorna could carry all she has. "Never mind wind, Watty, we have a chance yet," and the Skipper puts over the helm and squares away N. for Deseronto. "Get the spinnaker on her, and we'll give that black-hulled tank a chase for her money." The spinnaker is soon ballooning out to port, and the schooner responds with a raffee on her foremast. Watty notes the log—6 point 4—and then makes various bets with no takers that the schooner will catch us by the time we make Forester's Island. But, no! We seem to hold our own—nay, even gain—as the stronger puffs lift our straining spinnaker and sets it tugging at the afterguy. At the corner of Forester's Island our balloon canvas disappears as quickly as a young frog in the presence of a black bass, and our sheets come in for a jog to the W. The wind is falling now, and up go our big jib and the mizzen. About twenty minutes after rounding, Watty looked back toward Deseronto and then shouted, "There she is!" Sure enough, there, a mile and a half astern, that big hooker was just poking her flight of jibs round the corner of the I. O. F. preserve.

The sun had set before we reached Big Bay, and with the sunset the wind died away to a mere summer zephyr. The peace and quiet of the evening rested on us like a benediction after the hurly-burly of the day, and we watched the tawny glow of the sunset fade from the sky and water, feeling that, after all, more than half the charm of nature lay in the very fickleness of her moods. A churning, thudding steamer with her many glaring eyes comes surging up through the gloom astern. A wave of a lantern over our stern sets her swinging off to starboard, and she sweeps by with a tinkle of music and laughter, a fleeting vision of brightness. We follow in her wake, and, swinging to port out of the steamer course, drop anchor under Massasauga Point at 9:15 P. M., well content with the day's work.

Sunday was fitly kept as a day of rest. That is, we walked all over the park, took our time over our meals, and only troubled ourselves to sail to Belleville during the afternoon. There we lay alongside the retaining wall of Queen Victoria Park, just ahead of the old Norah, once a sloop now a schooner. Norah is one of the relics of old Captain Cuthbert, noted as the designer of the Countess of Dufferin and Atalanta, two America's Cup challengers, and also good old Whitewings, for years the champion of her class on the lake, but now a Port-Credit stonehooker. Here we stayed till 11:30 Monday morning, needing stores and having correspondence to attend to.

A light W. wind set us once more at the old wind-jamming game, and the Belleville bridge tender saw to it that we had a little more of the corkscrew experience squirming through his half-opened bridge. By 5 o'clock we had made the canal entrance. The wind was light and dead ahead, and Watty looked inquiringly at the Skipper, seeking to know what was to happen next. In about ten minutes he knew all about it, and found himself out on the tow path at one end of a hundred feet of line, the other being made fast half way up the mast to keep the line clear of the rough stones of the bank. Steadily he settled down to work, musing the while on the hardships of dry land yachting, and anon dispersing a school of dry land porpoises in the shape of cows. The day was cool and the sun getting low, so the conditions were favorable for active exercise, and the Skipper did not fail to impress upon Watty the beneficial effects of towing on the liver, or to encourage him by making commendatory remarks to all we met on the fine qualities of Lorna's "Government mule." Half way through, the mule kicked, and the Skipper was fain to take the towline himself.

Seven o'clock saw us through the canal and tied up to the end of the N. entrance pier. A hungry pair we were, too, after a very active day, and the evening meal fully satisfied the crew's propensity for good living and the Skipper's pride in displaying the qualities of Lorna's commissariat. The evening meal was usually our good meal. Breakfast was invariably light; lunch, too, was usually light. The Skipper holds that health and happiness are best promoted by moderation in eating and drinking, and by avoiding any wide departure from home habits. The frying-pan and whiskey bottle are still too much in evidence on some yachts.

The W. wind had now died away completely, and we were at the mercy of swarms of hungry mosquitoes till Watty in self-defense lit up one of his stogies. These were guaranteed to ward off burglars, and the mosquitoes simply shrivelled.

As the moon rose higher and higher, a faint zephyr from the E. gained in strength till it finally became a good whole sail breeze. Then the swimming reflection of the moon broke up into a long lane of frosted silver. Round the twinkling lights of the bay we slipped till the outer range light was close under our bow, then we swung sharply to the W. and again to the S. into the little cove behind it. There, in 6ft. of water, our anchor sought the bottom.

During the night a heavy thunderstorm broke over us. Sleep was out of the question till the din was over. At length the last mutter of thunder faded away in the distance, and we drowsed off into unconsciousness; but not for long. Twice the storm king returned to the attack with all his forces, and awoke us to listen to his threatenings. Watty was a patient man, and said little, but his

was the most profane silence I had listened to for a long time.

Naturally we rose rather late on Tuesday morning, and it was 9 o'clock ere we slipped out past the range light into the channel to the open lake. A brisk W. wind took us out through the well-buoyed channel, past the long shoal off Presqu'île light. Then hauling by the wind on the starboard tack, we settled down for 25 miles of windward work, for the breeze was almost dead ahead. The day was bright and warm, the lake a sparkling green-blue, ridged with a moderate roll from the W. Everything seemed favorable save the direction of the wind. But the singing of the rigging takes a higher key, the waves take on a sharper, hungrier look, and the boat, heeling another plank, plunges into the green ridges with a fiercer thud. A reef in the main eases her, and Watty settles down once more beside the Skipper. But the wind god is out for sport to-day, and keener and yet keener come his blasts. The mizzen and jib must come in. Watty lets go the jib halliard, and then spread-eagles on the struggling canvas, striving to lash it to the bowsprit. As he lies there clawing with his toes for a grip of something solid, Lorna throws herself half out of a wave top, plunges down its back and meets another with a crash ere she has time to rise. A cloud of spray spouts up from the bow, and a bucket or two of clear water is picked up and rolled aft to go pouring out of the scuppers. "Sail her easy, Skipper!" Watty shouts back, and easy it is till the jib is securely lashed, and a baby jib set with its tack lashed half way out on the bowsprit.

Once more, then, we fill away, making grand weather of it considering the sea. A windward bout of 25 miles in a gale of wind is no joke, however, for a little boat, and Watty's inquiries as to the possibility of getting shelter nearer than Cobourg were renewed every time a thundering smash threw a rattle of spray about our ears.

Then it occurs to us that this is a bad sea for a dinghy, and a glance astern shows that our poor little tender is nearly full. This is disgusting, and in no very good temper we heave to, get the dinghy alongside, haul her over the lee rail althwart ships, and dump her out. The job is an awkward one, but not very hard work, though as half the contents of the dinghy surged over Watty's legs, he was not very anxious for a repetition.

Once more away with wind and sea still increasing. The Skipper's eye travels only from the luff of the mainsail to the waves ahead, but Watty, with his back to the cabin house, commands a view astern. Suddenly he calls out, "The dinghy's adrift!" The Skipper glances astern. The dinghy had disappeared! There, a hundred yards or more astern, a wave heaves her up to view, riding as buoyantly as a cork. "Up with the helm—pay out the mainsheet!" and away we race dead to leeward, shooting forward on a wave front in a giddy rush, till the wave, slipping under us, leaves us staggering with our bowsprit skyward and land, sea and dinghy wiped from our gaze by rolling ridges of water. There she is again, lifting over a wave top. Now she drops out of sight again in the trough. We reach her, pass to leeward, and shoot up to her with canvas shaking. "Too much way on," and she is torn from our clutching fingers. Once again the headlong rush, the quick headreach. This time we meet her with too little way on, and a wave takes her away just as we feel she is ours. "This won't do. The wind and sea are too heavy for us to do the job with so much canvas on," so the mainsail comes down, and under storm jib alone we once more sail down on the truant. This time we catch her as we sail slowly by and with strenuous stretching and straining make the tow line fast to her once more.

This was the last straw. It was one o'clock. We had lost a mile of hard-won vantage. Cobourg was 19 miles to windward, Presqu'île 5 miles to leeward; ten hours or more of hard work to go on—an hour of rushing, thrilling play to go back. We went back.

The mizzen and jib seemed about all the canvas we wanted, and under this we logged 6 miles per hour. The waters are shallow near Presqu'île, and the waves became steeper and loftier. That dinghy seemed possessed of a denion, for, as the Skipper glanced back to note the wild running of the great white horses, a weltering wall of water picked up the little green imp on its crest, and hurled it madly at us. Straight as a die it came, but a quick turn of the tiller swung our stern to one side, and the dinghy swept by us till checked with a chug by the tow line. Then she paused till, sweeping by her, we tightened up the tow line with a tug that jarred us to the very keel, and threatened to capsize the dinghy. Another 50 feet of rope is quickly bent on to the tow line (50 feet), and then she rides well, with always sufficient room for a wave crest between her and the yacht.

Despite the short high sea, we ride very easy and ship no water, thanks to good freeboard and a sharp stern. Close now to port the breakers are rolling in a smother of white over Presqu'île Point shoal, so we haul by the wind on the port tack and stand in for the channel. Suddenly a violent flapping aft and a falling off of the yacht's head tells of something gone wrong. A glance reveals the trouble. The lashing of the block on the boom for the mizzen sheet has parted and the shoals are close under our lee. Watty looked aft for orders. "Get the reefed mainsail on her and then get down that jib." Over we go as Lorna feels the weight of wind in the added canvas. Down, down, till the deck is awash and everything loose down below is piled in the lee bilge.

But the canvas we must carry, and there is no time for another reef, so the Skipper keeps her at it. We do not trouble with the storm jib, for a little bit of the head of the big jib, hauled up as far as its lashings permit, answers every purpose, and so, half crippled, we stagger back to the quiet of our old anchorage, to gather breath for a fresh effort.

The rest of the afternoon we spent quietly ashore exploring. At the south end of the cove a little schooner lay high and dry on the beach.

Wednesday morning the wind was still strong, but by mid-day it had shifted sufficiently to give a long leg along shore and a short leg in, so about one o'clock we hoisted canvas and cleared our port. The sea was still heavy, and under reefed mainsail and storm jib we smashed into it till dark. Then the wind fell away, and under all sail we continued the monotonous task. Slow work, indeed, bucking a bad sea with little wind, and Cobourg lights

seemed as though they moved as we did. Till 4 A. M. the Skipper remained on watch, though truth to tell there might have been one-half hour about which he could tell but little. Then Watty turned out, and about 6 o'clock steered in between Cobourg piers with the remains of a light land breeze. Cobourg was now only of use to us as a depot of supplies, so we put to sea again about 8:45 A. M.

This proved to be another day of unfavorable wind, but moderate in strength, falling to light and coming absolutely dead ahead as the day advanced. By night we were only a few miles west of Port Hope, and the morrow (Friday) was the day Watty should be in Toronto. Only one course was open to get him there, and that was to send him home by train from the nearest port, while the Skipper continued alone.

Newcastle was nearest at hand, but so light was the breeze all night that we could only crawl within a mile of the harbor by 7:30 Friday morning. Afraid of missing the train, Watty dressed himself in his best and rowed into port in the dinghy. Thus I parted with the best all-round crew and the jolliest companion I had shipped on Lorna. The man who can stand the test of two weeks' close companionship in a small boat deserves to have his epitaph written before he dies.

Forty minutes later Lorna worked in and became reunited to the dinghy. The dinghy, by the way, enjoys the distinction of being the smallest on Toronto Bay. She is 8 ft. 6 in. by 3 ft., flat bottomed, but with a good rocker fore and aft, so that when towing she just squats a trifle and tows as true as a die.

Now commenced a new chapter in the experiences of the cruise. The Skipper was thrown on his own resources, and so uncommon was it to see a lone mariner on Lake Ontario that all the waterside populace crowded to the dock end to see Lorna put out. A friendly hand took a tow line to the end of the dock, and then Lorna filled away under mizzen and jib. I noted the time, 1 P. M., then ran forward and hoisted the mainsail, while the boat jogged along unattended save for an occasional pull on the jib.

Now, then, what shall be our port to-day? A good sleep is a prime necessity to-night. The wind is light and W. Let it be Darlington, then only 5 miles away. But the wind makes it easier to strike right across toward Raby Head and Oshawa, and Darlington seems so near, so "whispering hope" says "Try Oshawa."

I tried it, and miserably failed, for the wind fell so light and came so dead from the S.W., that by 7 P. M. Lorna was just a little west of Raby Head, and only about 8 miles from Newcastle. No port—no chance of a port. Sleep I must have. The sky is clear, the barometer high and steady, so we will even anchor along shore and trust in Providence.

The cliffs loomed higher and higher as I crawled in toward them. The water was crystal clear, and the bottom seemed almost to touch the keel. Such a bottom, too! Boulders of all sizes from mere pebbles to huge humpbacks as big as the boat herself—a bottom to make a sailor shudder. No help for it, however, and picking a fairly clear spot, I dropped the anchor in about 12 or 15 feet of water, then went below for some supper, and turned in all standing at 8 P. M.

At 11 I woke and went on deck. The silence was profound, the sea asleep. No light along the shore. Above the stars around me, the blackness of the waters lit with the trembling reflections of the sky.

Saturday morning I awoke at 5:25 o'clock and looked out of the hatch. A nice land breeze was blowing, and I jumped for the halliards one after the other. Then came the anchor, and by 5:30 I was under way. The coast slipped by like a dream panorama, for the offshore breeze scarcely ruffled the lake. Oshawa's pier and gay summer cottages were abeam by 8 A. M., and then the land breeze petered out and left me scarce moving. Very shortly, however, a nice S.E. breeze sprung up and carried me into Frenchman's Bay by 1 P. M., when it, too, dropped to the merest air and shifted to the S.W. The lighthouse at Frenchman's Bay is on the E. pier, and shows a small green fixed light at night. Inside the piers the channel turns sharp to the right and then to the left in front of the ice houses on the E. shore. I ran in and dropped anchor close to the W. side of the channel, well inside the bay.

Sunday morning I was roused to consciousness by the departure of a huge ice barge. A fine, clear day it was, with a light sou'easter raising dancing corruscations in the wake of the sun. A plunge overboard washes the sleep from the eyes and breakfast puts vigor into the frame.

"Now for home!" I shout, and for the last time weigh the anchor and fill away for the last day's run. As I neared the piers I noticed a somewhat familiar looking glass-sided cabin showing over the dock. "Can it be?" I cried, and then, "Yes, it is," as a familiar figure climbed out onto the pier. It was the gasoline launch Vida, with her owner, his wife and three children on board, bound whence I had come. Hearty greetings passed as I tacked out past them. "All alone?" "Yes." "Well, good luck and good-by." "Good luck and a pleasant voyage." Then I swung away W. and saw them no more.

Slowly, oh, so slowly! the miles went by. Off the Dutch Churches the wind failed altogether, and left me helplessly turning circles. The gray lake gulls swooped by shrieking derisively; a train ashore flashed past a gap in the trees with a boastful, defiant, long-drawn whistle. Both man and nature seemed to taunt me with my impotence. Again, however, the E. air, not strong enough to feel, in some strange manner started Lorna once more on her westward way.

The afternoon wore away, the sun disappeared behind the smoke of Toronto, flooding the W. with tawny orange; the dusk gave place to darkness; the stars imperceptibly grew into their accustomed places, and still the seemingly endless stretch of the Scarborough bluffs lay to starboard. Victoria and Munro Park electric lights flash out off the starboard bow, and ere long a belt of sparkling diamonds stretches from abeam to dead ahead. Inshore boats put out from the parks and beaches, and the sound of singing floats out to me. As I sit aloof from it all, straining my ears to the sweet sounds of human presence, and searching restlessly the while for the red light at the E. gap, an exquisite soprano took up the

strains of Newman's "Lead Kindly Light," and I realized as seldom before the mood of the writer when penning the pregnant lines. Only a sailor seeking his home port in the darkness of night can appreciate the full beauty of that hymn.

One by one the singers turn back home; one by one the lights ashore disappear from the cottage windows; and still the E. gap is miles ahead. As I sit patiently awaiting the wind's will, I note a ruffling of the swimming reflections inshore, and hail with joy the coming of that good old friend, the night wind offshore. The breeze coquettes with us for awhile, and then comes true and fresh.

Now the inshore lights begin a merry dance, shifting, changing, disappearing and reappearing as we speed gaily on. The inner red range light of the gap modestly retires further and yet further from its revolving principal. The touch of the wind banished drowsiness and languor; the quick dance of the yacht thrilled the pulses, and the consciousness of assured achievement added the crowning glory to the pleasures of that sail.

The gap lights grow brighter and draw nearer and nearer into range. The small one disappears behind the greater, and we swing sharp to starboard up the channel. I look in at my watch as the big red eye goes by—12, midnight, and safe home at last.

C. D. H.

Gas Engines and Launches.

(Continued from page 289.)

BY F. K. GRAIN.

Spark Coils.

OF course it is necessary to employ a spark coil in order to obtain the resistance necessary to produce the proper spark. When the gas engines electrically ignited first came into use, it was customary to employ the ordinary coils used for gas lighting. Although these coils produced a very satisfactory spark, they did not offer sufficient resistance, consequently they were very hard on the battery, and nowadays we have coils especially wound for gas engine ignition, commonly called quick acting coils. The modern high speed engine would not operate with the old coils as they did not work sufficiently fast; but with the modern coil we easily obtain speeds of from 12 to 1,500 of positive ignition. A coil properly made should allow of the full amperage, but should have sufficient resistance to keep the voltage down to about 5 to 6; this prevents the ignition points of the electrodes from burning. For marine work we advise the placing of the coil in a box and, pouring it full of paraffine wax; this prevents all moisture getting at the coil.

A word as to the construction of the coils will explain to you more clearly their weak points in reference to moisture. They all consist alike of a core consisting of a bunch of straight annealed iron wire. Around this is wound several layers of insulated copper wire. Now should these iron wires, which, of course, are not protected by any insulation, become rusty through dampness, it destroys the coil, and, although the copper wire is not affected so much by dampness, the salt air will very soon rust the iron core if not protected. Once it is rusted, there is nothing to do but throw away the coil.

Lubricating Oils.

Lubricating oils receive but scant attention. While of course, the oil used on the outside of the engine may not make any difference in the working of the engine, it is imperatively necessary that the cylinder and crank case oil should be uniformly alike—of the very best fire-test cylinder oil. If an ordinary steam engine oil or an oil of poor quality containing animal or vegetable oils is used, it will produce a carbon deposit, which will fill up the ports and produce a cutting of the cylinder, and also, by burning, interfere with the perfect combustion of the gases and cause trouble all around. The best grades of cylinder oil cannot be obtained for less than about thirty to forty cents in barrel lots, retailing at about double that figure. Therefore, if you are offered any oil at less than these figures, beware.

British Letter.

THE Scotch regattas were brought to a close with the fixtures of the Royal Highland and Lorn Corinthian Yacht Clubs on Sept. 15 and 16, respectively, at Oban. Considering the lateness of the season, and the fact that most of the yachts racing there came from the Clyde, it speaks volumes for the enthusiasm of northern yachtsmen that these autumn fixtures are usually so successful. This year was no exception to the general rule, for, encouraged by the continued fine weather, there was a good muster of racing boats, and more than the usual number of fine steam and sailing yachts brought up in the beautiful bay. With the successful carrying out of these belated items the yachting season may be said to be closed, as, with the exception of a few up-river sailing clubs and a small club here and there on the coast, there will be no more races till next season, and yachts are fast finding their way into winter quarters.

While it is refreshing to note how yacht owners north of the Tweed keep up their enthusiasm to the very end of the season, and give practical proof of this by keeping their boats out till racing is really over, it is quite depressing to find in the south of England how owners cool down after Cowes and Ryde weeks, and what a thinning out there is annually in the ranks when the boats leave the Solent to begin the round of races commencing at Weymouth and ending at Plymouth, commonly known as the West of England regattas. Ten years ago, when a good many of our boats used to take part in the Riviera regattas, it was quite conceivable that people would have enough of it before the bitter end came, but in those days such yachts as visited the Mediterranean had a season

which began in February and extended to the first week in September, with the exception of the month of May. For the last five or six years very few British racing yachts have visited the Riviera, and the argument does not, therefore, hold good. It is difficult to see why owners fight shy of the western ports, for the harbors are good and safe, the courses in every case are laid out in the open in deep water, and are infinitely superior to any of the courses inside of the Isle of Wight, where tides and shoals abound, or for that matter to any of the courses on the east coast. Moreover, the clubs which provide the bulk of the sport are of good standing, and the prizes offered are of good value. It can only be assumed that the same apathy which allows British yachtsmen to swell the already enormous fleet of yachts which take part in the German regattas in the Baltic at the end of June, at the expense of their own national fixture, the Clyde Fortnight, and which has also been the means of killing the once flourishing Irish regattas, permits of their ignoring more and more the efforts made by the western clubs to provide them with adequate sport in their own waters. Kiel is a beautiful place, and the Baltic regattas are most enjoyable functions in every way, but yachting is one of Britain's national pastimes, and anything which militates against the success of the racing season in home waters should be severely discountenanced by its votaries. The Germans are perfectly able to run their own regattas without our assistance, whereas the Clyde Fortnight suffers more and more through the absence of our vessels in German waters. The sooner the situation is faced the sooner will there be a revival in British yacht racing, for not only will the Clyde be the gainer, but the presence of the racing fleet in British waters throughout the season would mean the resuscitation of the Irish regattas.

Fife's new schooner *Susanne* has been hauled up at Sandbank after a very successful season in German waters. Enthusiasts on the Clyde acclaim her as Fife's *chef d'œuvre* in the way of a two-sticker, and even go so far as to compare her with *Ingomar*, to the latter's disadvantage. Now, there is no doubt that *Susanne* is a very slippery boat in her own weather, but that happens to be light weather, whereas *Ingomar* was good all round—good enough, in fact, to win prizes under all conditions of wind and sea. Fife's schooners are handsome vessels, and fast, too, but they are lacking in stability—at any rate as compared with *Ingomar*. This fault, indeed, has been noticeable with nearly all Fife's new boats, and both *White Heather* and *Susanne* suffered badly from it, while *Cicely* was none too stiff. On the other hand, *Ingomar* could carry her jackyard topsail when a big ship like *Meteor* could only put up a sharp header, and her performance in the long, hard thrash from Dover to the West Hinder Lightship against *Navahoe*, in the race to Ostend last July, was something that neither of the other schooners above mentioned could hold a candle to. In this long beat of fifty-two miles in a strong easterly wind and nasty sea, the schooner beat the yawl by no less than ten miles, and it is quite safe to say that no British schooner yet built would have equalled this wonderful performance. The fact is *Ingomar* is a vessel in which are combined the greatest amount of driving power and the maximum of stability, and the combination, taken in conjunction with a shapely hull, enables her to be very fast in all weathers.

The talk about the America's Cup challenge has died down again, and it is generally felt that there will be no further races, unless the New York Y. C. discards the obsolete rating rule in favor of the new.

E. H. KELLY.

[In the English Letter appearing in our issue of September 10, Clyde week is mentioned. This was a mistake, and it should have read Ryde week. This was an unfortunate error, as the Ryde week races are important, and as there is no Clyde week, readers may have confused this series with the Clyde Fortnight, which takes place in July.]

Sport and Advertising.

Editor *Forest and Stream*:

I was rejoiced to see your comment in the issue of October 1 on the editorial in *The Yachtsman* relating to the America's Cup. I did not suppose that I was the only one who entertained the same views, but I have not seen them expressed in print before. If the trophy is to become a "Tea Cup," let us fill it with tea from Boston Harbor and let who will have it.

J. E. HINDON HYDE.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

PICAYUNE SOLD.—The 35ft. waterline cabin sloop *Picayune* has been sold by Rear Commodore Leonard Nicholson, of the Southern Y. C., to a party of scientists who will explore the northern coast of the State of Colombia, South America, where she will be taken on the deck of a steamer. The sale was made through the agency of L. D. Sampson, secretary of the Southern Y. C. Commodore Nicholson, in conjunction with his brother, York Nicholson, will replace *Picayune* with a 70ft. schooner yacht of Crowninshield design.

CRUISING LAUNCH FOR C. W. LEE.—There is being built at Mr. Robert Jacob's yard, City Island, a cruising launch for Mr. Charles W. Lee. The boat was designed by Mr. Henry T. Gielow, and will take the place of the 40ft. launch *Javelin*, now owned by Mr. Lee. The new boat is 59ft. over all, 53ft. waterline, 10ft. 6in. breadth, and 3ft. 9in. draft. She will have a single screw, and will be driven by a 25 horse-power Standard motor. A speed in excess of 10 miles is looked for. The boat has two low cabin houses of mahogany, one forward and a larger one aft. Between the two houses the deck is flush. This adds greatly to the boat's strength, and not only gives a good place from which to steer, but serves to separate the engine space and crew's quarters from the owner's cabins. The fuel tanks are in the eyes of the boat. The crew's quarters are under the forward deck, the galley and engine room are under the forward house. The owner's

quarters, located under the after house, are roomy and comfortably and simply fitted. The boat can steam 500 miles at a 10-mile clip without refilling her tanks. She will be completed January 1, 1905.

VINGT-ET-UN TO RACE ABROAD.—Mr. Willis Sharpe Kilmer, owner of the motor boat *Vingt-et-Un*, has gone abroad, and has taken the boat with him. She will be raced on the Mediterranean during the winter.

THE CENTER MORICHES COUNTRY CLUB has acquired three acres of shore front at Center Moriches, L. I., and will build a club house 30ft. by 80ft. The club is to give special attention to yachting and has on its roster of officers two enthusiastic small boat sailors—Mr. Harry Growtage, secretary, and Mr. John L. Havens, treasurer. Dr. William E. Carr is president.

NEW YORK Y. C. MEETING.—The fifth general meeting of the New York Y. C. was held at the club house, West Forty-fourth street, New York city, on Thursday evening, October 6. Commodore Bourne presided. After the usual reading of committee reports, other business was transacted, and nine new members were elected. The meeting was the largest held in many years, some twenty-seven yacht owners being present. The following gentlemen were elected to serve on the Nominating Committee: Ex-Commodore Lewis Cass Ledyard, steam yacht *Rambler*; Charles T. Minton; William M. Lovering, schooner *Mavis*; Philip T. Dodge; Edward Eyre, steam yacht *Viva*; Stephen Peabody, Ashton C. Clarson, sloop *Chiquita*; Hunter Wykes, John E. Wayland, auxiliary yawl *Pawnee*; Robert L. Forest.

In order that the club's racing rules, measurement rules, and time allowance tables shall be uniform with those of other clubs and associations, a committee is to be devoted to that end. The following resolution was adopted:

That the chair appoint a committee of eight on racing rules and measurement for time allowance, with power in their discretion to confer with other clubs, which committee shall also have power to appoint a sub-committee to advise with them as to the proper formula for time allowance for races between steam and power vessels, both large and small.

Small racing boats are such a factor in the sport to-day that it was deemed advisable that such craft be encouraged. In order that this matter be given immediate attention, this resolution was adopted:

That the chair appoint a committee of three for the purpose of interesting members of the club in the building of yachts in the one-design or restricted classes, and of sizes either entitled to representation or not entitled to representation, with power to procure from naval architects designs and estimates and to submit the same to the members who may contemplate building in such classes.

Medals are to be given to the owners of boats winning challenge cup. The following resolution deals with this matter:

That the chair appoint a committee of four, of which the secretary of the club shall be one, to report in general upon a proper medal for the Bennett Challenge cups, the Navy Alumni Association challenge cups, and also as to a club medal for minor prizes. This committee to report at the December meeting.

Mr. James R. Steers presented an oil painting of the schooner *America* that was painted by a man named Hausen under the direction of Mr. Steers' father, the builder of the famous vessel.

Mr. Howard Gould offered \$5,000, the income of which was to be put yearly into trophies for power boat competition. The races for these prizes will be for vessels in the neighborhood of 100ft. in length.

Old Mill Y. C.

Jamaica Bay, L. I.—Sunday, Oct. 2.

THE wind-up race of the season on Jamaica Bay was sailed on Sunday, Oct. 2, under the auspices of the Old Mill Y. C.

Of the twenty-four power and sailboats that started in the race, all but three were timed at the finish. Mr. William Gallagher's raceabout *Jennie*, of the Jamaica Bay Y. C., won the cup offered by Mr. George McLean. Nip captured the commodore's cup. The other winners were *Diana*, *Bozzie*, *Alert*, *Pet*, *Lottie M.*, and *Naomi*. The wind was fresh from the W. by N.

The course for sloops and raceabouts and sloops was from the starting line at the entrance of Spring Creek, down Main Channel to the red spar buoy off Barren Island, and return.

The course for all other classes was from the same starting line to a flagged buoy in Main Channel, near the Canarsie breakwater; thence to a flagged buoy off Howards, to the starting line; sailed over twice.

Sloops—Special Class—Start, 1:55.		
	Finish.	Elapsed.
Ianthe	Disabled.

Rhode Island Letter.

Providence, R. I., Oct. 8.

EVERY year at the fall end of the season there is a sweepstake race arranged for catboats, and it often provides some highly interesting sport. It did this season. The race was held last Sunday, off Cominicut, the course being laid from Riverview across the bay to Nayatt Point and return, a leeward and windward course, sailed twice over, giving a total distance of about 11 miles.

There was a smashing good W. breeze, and the race was one of the best of the season. In the 30ft. class, *Elizabeth*, the cham-

pion of the season, had an accident early in the race, and although the damage was slight and soon patched up, she finished last of the four entries, nearly 12m. behind the leader. *Mblem* put up a good race, and completed the first round just one second ahead of *Emeline*; but the latter forged ahead on the second round, and finished winner by 2m.

Emeline is one of the best-known racing cats in the bay, but this was the first time she had been raced in more than two years. She is somewhat longer than the others in the class, and on account of her model is under a handicap under the 2 per cent. measurement rule that governs the class. She is a very fast boat, however, and it was her weather in every way. She sailed on equal terms with the others on this occasion, as the race was boat for boat, and length did not count for allowances. In the other two classes the winners were *Nobska* and *Janice*. The summary:

30ft. Class—Start, 1:30.		
	Finish.	Elapsed.
<i>Emeline</i> , J. A. Wolf	3 13 30	1 43 30
<i>Mblem</i> , G. E. Darling	3 15 32	1 45 32
<i>Scatt</i> , H. B. Scattergood	3 19 10	1 49 10
<i>Elizabeth</i> , W. D. Wood	3 25 11	1 55 11

25ft. Class—Start, 1:32.		
<i>Nobska</i> , W. J. Rooks	3 21 30	1 49 30
<i>Ina</i> , N. C. Arnold	3 21 34	1 49 34
<i>Marguerite</i> , J. D. Peck	3 25 11	1 53 11

18ft. Cats—Start, 1:34.		
<i>Janice</i> , H. Duckworth	2 47 30	1 13 30
<i>No Name</i>	2 52 40	1 18 40
<i>Una</i>	2 59 20	1 25 20

The last of the three special races for 30ft. cats of the Edge-wood Y. C. was sailed Oct. 8, and *Elizabeth* was the winner. This makes Mr. Woods' boat the champion of her class for the season, and the winner of the club's cock-of-the-walk pennant. A triangular course was laid out to be sailed three times over.

Near the outer mark, however, *Mblem* withdrew and sailed in to her moorings in Pawtuxet Cove. *Elizabeth* finished the first round, and was declared the winner without sailing the other two rounds.

Rifle Range and Gallery.

Fixtures.

Nov. 8.—Greenville, N. J.—Annual 100-shot championship at Armbruster's Park.

Promotion of Rifle Practice.

A MEETING of the National Board for the Promotion of Rifle Practice has been called for the 22d of this month. It will be held at the War Department, and a full attendance of the members is expected. The principal matters which will come before the Board at this meeting will be the approval of the awards made at the recent shoot for the national trophy at Fort Riley, Kans., and the subject of what legislation will be sought for at the hands of Congress during the coming session. At its last meeting the National Board adopted a most comprehensive plan for the formation of a National Marksman's Reserve, including the encouragement of rifle practice in the State militia where necessary, in military and other schools, and among those individuals who may be called upon to serve in time of war. As a first step in this direction the National Board desires an appropriation of one million dollars per annum for five years, to be expended under the direction of the Secretary of War for the providing of ranges, their equipment and maintenance. The Board desires that these ranges should be open to use by civilians on every holiday and Saturday and at other times when possible, of course, under appropriate regulations. As an inducement for rifle practice in the schools, the Board proposes State championship badges and a national school trophy, recommending an annual appropriation of \$5,000 for the former and \$20,000 for the national trophy.

The National Board has had this matter under consideration since its organization under the act of March 2, 1903, and for several years before that those who have been most actively identified with this project were engaged in mapping out the plans. At the coming meeting it is expected the National Board will take up the question of legislation, and a bill will be drafted to be presented to Congress in December.

The interest which President Roosevelt takes in military rifle practice is shown by a letter which he has written to private Howard Gensch, of the First Regiment of Infantry, New Jersey National Guard, at Madison, N. J. Private Gensch recently won the President's match at Sea Girt, N. J., on the occasion of the annual meeting of the National Rifle Association. The letter, which was made public to-day, is as follows:

"White House, Washington, Sept. 24, 1904.

"My Dear Sir: I have just been informed that you have won the President's match for the military championship of the United States of America. I wish to congratulate you in person, and through you, not only the First Regiment of the National Guard of New Jersey, but the entire National Guard of New Jersey. As a nation, we must depend upon our volunteer soldier in time of trial, and therefore the members of the National Guard fill a high function of usefulness. Of course, a soldier who cannot shoot is a soldier who counts for very little in battle, and all credit is due to those who keep up the standard of marksmanship. I congratulate you both on your skill and upon your possession of the qualities of perseverance and determination in long practice, by which alone this skill could have been brought to its high point of development.

"With all good wishes, believe me,

"Sincerely yours,

(Signed)

"THEODORE ROOSEVELT."

It was forwarded to Mr. Gensch through Gen. Bird W. Spencer, president of the National Rifle Association. The President's match is shot for at 200, 300, 500, 600, 800, and 1,000 yards, and carries with it the military championship of America, a medal and a number of prizes. Private Gensch won the match with a score of 192 out of a possible 210 points.

New York City Schutzen Corps.

LAST outdoor practice shoot of the season was held Wednesday, Oct. 5, at the Union Hill Park. Scores:

Ring target: J. Facklamm 219, R. Busse 216, A. Kronsberg 213, W. Grapentin 211, C. G. Zettler 205, R. Bendler 192, O. Schwane-man 191, R. Schwaneman 186, J. Keller 168, J. Moje 168, G. Schroeter 164, C. Wagner 155, H. C. Radloff 152.

Man target: W. Grapentin 56, C. G. Zettler 56, A. Kronsberg 53, G. Schroeter 51, R. Busse 50, H. C. Radloff 50, R. Bendler 50. Point target: R. Busse 12, O. Schwaneman 11, A. Kronsberg 11, J. Facklamm 9, R. Bendler 7, R. Schwaneman 7, C. G. Zettler 7, Ch. Wagner 7, W. Grapentin 5, A. Wiltz 3, J. Keller 2, J. Moje 2, G. Schroeder 2, H. C. Radloff 1.

Bullseye target, best bullseyes made during the season's contest follow: J. Facklamm 7½ degrees, R. Busse 25½, O. Schwane-man 27, R. Schwaneman 29, R. Bendler 36, W. Grapentin 50, H. C. Radloff 51½, A. Kronsberg 52½, J. Keller 107½, C. Wagner 120, A. Wiltz 134, C. G. Zettler 136, G. Schroeter 145, J. Moje 160.

Zettler Rifle Club.

At the last meeting of the Zettler Rifle Club, at its headquarters, 159 West Twenty-third street, New York city, the following programme was voted on and passed for the winter season shoot, 1954-5. The amount of money placed on the bullseye target this year is a radical departure from the programme in the past, it being the desire of the club to encourage those of its members who find they cannot keep pace with the experts for a long series of scores, but who feel they can make things interesting when it comes to a single shot each evening on 4in. carton:

Gallery season shoot, 1954-5, \$275 donated by the club, for members only. Each member allowed to shoot five targets of 10 shots each on each Tuesday. Regular 25-ring, 1/4in. target. Any .22cal. rifle, short cartridge allowed. No practice shots. Entrance fee 20 cents per target. Two hundred dollars will be divided equally on the total number of rings shot. A shooter must have 75 targets to be entitled to any prize on the programme.

The following donations are to be won for making the highest number of rings during the season, in addition to the regular ring money: First, \$10, donated by Zettler Bros.; donated by the club: second, \$5; third, \$3; fourth, \$2.

Bullseye Target.—Best bullseye by measurement to count. One shot gratis to each member every evening during the season. Prizes: First, \$15; second, \$12; third, \$10; fourth, \$8; fifth, \$7; sixth, \$6; seventh, \$5; eighth, \$5; ninth, \$4; tenth, \$3; eleventh, \$3; twelfth, \$2; thirteenth, \$2; fourteenth, \$2; fifteenth, \$2.

Shooting Days.—Shoot starts Tuesday, Oct. 18, and every following Tuesday until April 10, 1955.

Should a member be absent from a shoot he has the privilege to shoot his arrear score after the members have shot their regular evening scores.

All disputed shots to be decided by the shooting master, whose decision in all cases must be considered as final.

H. D. Muller, Chairman. B. Zettler, Shooting Master.

Rifle Notes.

The annual 190-shot championship match for Greater New York and vicinity will be shot, as usual, at Armbruster's Schuetzen Park, Greenville, N. J., on Election Day, Nov. 8. Programmes will be published in next week's issue. All those desiring to participate should communicate with L. P. Hansen, 93 Montgomery street, Jersey City. No entries received later than Saturday, Nov. 5.

The outlook for gallery contests with the small-bore rifle this coming winter is exceptionally bright. With the formation of the Twenty-Two Caliber Indoor Rifle League, of which many prominent riflemen throughout the country are officers and members of the shooting committee, the stimulus imparted to this important branch of rifle shooting will be two-fold. A few years ago the great bugbear of the rifle crank was the very cold weather encountered during the winter months in this section of the country, which prevented him, for the time being, from continuing his outdoor practice, forcing him to continue with very inferior arms and ammunition provided for gallery work. This, however, is a thing of the past. The manufacturers of rifles and the ammunition concerns, being alive to the situation, have brought the gallery rifles and the rim-fire cartridges to that state of perfection where they can be absolutely depended upon to produce results in conformity with that of outdoor long range work. Chicago at the present time has several promising gallery clubs. Then there is that old reliable Myles Standish Club, of Portland, Me., and the Iroquois, of Pittsburgh, together with quite a number sprouting up throughout the West. Let us get together this winter, and by diligent work have many new men in line fighting for championship honors when the gallery championship match of the United States takes place in the spring.

New York Schuetzen Corps.

The following are the prize winners of the season's outdoor contest of this well-known organization. Mr. H. Von Minden presented a \$100 medal for competition on the bullseye target. A glance at the scores will show the strenuous efforts put forth by the members for this much-coveted trophy.

Bullseye target: O. Schwaneman 12 1/2 degrees, Gus Zimmerman 20, F. Facompre 27 1/2, J. Facklamm 35, G. Ludwig 40, R. Ohms 46 1/2, H. B. Michaelson 47 1/2, H. Meyn 47 1/2, H. Beckmann 49, B. Zettler 52.

Man target, best two tickets to count:

G Ludwig.....58 56-114 O Schwaneman.....56 55-111
J G Tholke.....56 55-111 W Lahe.....57 54-111

Ring target, total number of rings during the season: J. C. Bonn 1202, F. Busch 1161, G. Thomas 1045, J. H. Klee 1011, J. H. W. Meyer 1001, J. G. Tholke 990, H. Lohden 985, D. Wilkins 981, H. Mesloh 958, J. H. Hainhorst 956, A. W. Lemcke 952, H. Gopher 943, Ch. Plump 916, N. C. L. Beversten 916, D. Peper 905, J. F. Cordes 900, Dr. C. Grosch 886, H. C. Hainhorst 885, G. W. Offermann 882, J. N. Herrmann 850, H. D. Meyer 847.

Special ring target: Gus Zimmerman 141, G. Ludwig 140, C. Schmitz 139, J. C. Bonn 135, G. Thomas 131, J. Facklamm 129, H. Nordbruch 125, H. Lohden 122, A. W. Lemcke 121, J. G. Tholke 120, O. Schwanemann 118, F. Facompre 118.

Zettler trophy.—Conditions: The man making the most 18s on the ring target during the season to take the trophy: F. Busch 12.

Annual Individual Rifle Championship Match.

The annual 100-shot match will be held Election Day, Tuesday, Nov. 8, at Greenville, Schuetzen Park, N. J., under the auspices of the Zettler Rifle Club.

Conditions: One hundred shots per man, on the German ring target. Any rifle and any sights, including telescopes. Jacket bullets barred. Entrance fee \$5. A forfeit of \$2 must be posted on all entries on or before Saturday, Nov. 5. No entries received after this date.

All riflemen intending to participate, should communicate with L. P. Hansen, 93 Montgomery street, Jersey City, N. J., or Headquarters, Zettler Rifle Club, 159, West Twenty-third street, New York.

A fine trophy will be presented by Mr. T. H. Keller to the shooter making the highest 100-shot score. A fine trophy will also be given for the best 10-shot score by Mr. Armbruster.

After deducting the expenses of the targets and the dinner given the contestants, the balance of the entrance money will be divided pro rata.

The targets will be open from 9 A. M. to 5 P. M. Match to start at 10 A. M. Each contestant will be allowed ten sighting shots.

Shooting Committee: L. P. Hansen, Chairman; Wm. Hayes, T. H. Keller, H. M. Pope, E. H. Van Zandt, F. C. Ross, W. A. Tewes, M. Dorrier, T. R. Geisel, H. D. Muller.

Presque Isle Rifle Club.

ERIE, Pa., Oct. 1.—Only eight members attended the weekly shoot to-day. A heavy rain had spoiled the grounds and targets, and a high north wind blew all afternoon.

Two of the members who were absent to-day, J. G. German and his business partner, George Rahn—they run a machine shop—were probably over in Misery Bay, fishing. They were still there the next morning, and from the fact that they were there, two young men from the city probably are alive to-day. The young fellows had crossed to the bay early in the morning to hunt ducks in a small rowboat, and when in the middle of the bay managed to upset their boat. German and Rahn were at breakfast in a house-boat they have over there, and hearing the boys yell, went after them with a skiff, and brought them ashore not much the worse for the wetting; but two fine guns now lie on the bottom of the bay.

Moral: Don't go hunting ducks on Monday, and it is just as well not to go hunting them on any other day unless you know how to handle a boat, or can swim.

Scores:

J. Almeda.....80 79 75-234 J. Bacon.....71 70 70-211

CABIA BLANCO.

W. A. Barker's Record.

SYRACUSE, N. Y., Oct. 8.—Sept. 24 Mr. W. A. Barker, of Jersey City, N. J., shot a 50-shot match, 200yds., off-hand, on German 25-ring target, for \$100 a side. Mr. W. A. Barker finished with 1157 points, his last string of ten shots counting 241 points, thereby establishing a new 10-shot record. WM. O. ZISCHANG.

Trapshooting.

Fixtures.

Oct. 12-13.—Sistersville, W. Va., Gun Club fall tournament. Added money to all events, and prizes. Ed. O. Bower, Sec'y.
Oct. 12-13.—Indianapolis, Ind., Gun Club fall tournament. James W. Bell, Sec'y.
Oct. 15.—Poughkeepsie, N. Y.—Poughkeepsie-Ossining team match.
Oct. 18-19.—Litchfield, Ill.—Consolidated Trapshooters' Congress.
Oct. 18-20.—New London, Ia., Gun Club tournament. Dr. E. C. Cook, Sec'y.
Oct. 20.—Poughkeepsie, N. Y., Gun Club fall tournament.
Oct. 25-26.—The Plumsteadville, Pa., target tournament. N. L. Clark, Sec'y.
Oct. 26.—Concord, Staten Island.—All-day target shoot of the Mullerite Gun Club, on the grounds of the Richmond Gun Club. A. A. Schoverling, Mgr.
Oct. 26-28.—Blackwell, Okla., Gun Club tournament. Chas. Cornelius, Mgr.
Nov. 1-3.—St. Louis Mo.—World's Fair shoot; live birds and targets. Alec D. Mcmrod, Mgr., 620 Locust street.
Nov. 8.—Bound Brook, N. J., Gun Club all-day shoot; merchandise prizes. F. K. Stelle, Sec'y.
Nov. 17-19.—Tampa, Fla.—Tampa Bay Rod and Gun Club, \$400 added. J. A. Hansbrough, Sec'y.

DRIVERS AND TWISTERS.

Mr. H. C. McMurchy, of the Hunter Arms Co., was a visitor in New York this week.

Mr. Bert Bisbing captured the club medal at the shoot held by the Hillside Gun Club, Chestnut Hill, Oct. 8. The event was at 50 targets, and he scored 44.

The secretary, Mr. E. G. Wallace, informs us that the Marshalltown, Ia., Gun Club will hold a two-day amateur tournament on Oct. 13 and 14. Average money will be offered.

The programme of the Scranton, Pa., Rod and Gun Club annual target tournament, to be held on Oct. 13, provides ten events, a total of 175 targets, and a total of \$9 entrance. Shooting commences at 10 o'clock. Mr. J. D. Mason is the secretary.

The contest for the State championship of Indiana, between Messrs. Max Witzgreuter and H. M. Clark, at Ft. Wayne, on Oct. 2, resulted in a tie, each scoring 45 birds out of a possible 50. The match was refereed by Mr. G. G. Williamson, of Muncie, Ind.

The closing shoot of the W. P. T. S. L. was held at Allegheny, Pa., on Oct. 4 and 5, and had high averages for the two days as follows: First, Kelsey, 332 out of a possible 350; second, J. F. Calhoun, 327; third, J. T. Atkinson and L. J. Squier, 326; fourth, Messrs. Irwin and Davis, 321.

The contest for the championship of the Ashland Gun Club, Lexington, Ky., Sept. 30, had eighteen contestants. Four tied on 9 out of 10 birds. In the shoot-off, miss-and-out, Mr. W. Henderson won in the fifth round, Mr. R. R. Skinner being the runner-up. He lost his fifth bird dead out.

The "no bang, no bird" clause, which betimes appears as a feature of tournament programmes, is a misnomer. It should be changed to read that targets will be trapped subject to the approval of the contestants, and that until a contestant finds one exactly to his liking, the remainder of the contestants may wait.

The Plumsteadville, Pa., Gun Club will hold a two-day target tournament on Oct. 25 and 26. The programme consists of ten 15-target events each day, entrance \$1.20. An eleventh event at 25 targets, entrance \$1.50, is provided. Shooting commences at 10:30 o'clock. The sliding handicap will govern. Mr. N. L. Clark is the Secretary and Manager.

The deciding match of the team series between the Allentown Rod and Gun Club and the Independent Gun Club, of Easton, Pa., was shot on Oct. 1. The Independent team won by a score of 184 to 183. This distinguishes the Independent ten-man team as the undefeated team of the State, having defeated all comers. It is rumored that the next contestant in a team match with the Independents will be a Philadelphia team.

The Shooting Committee of the Crescent Athletic Club, of Brooklyn, N. Y., has decided, on account of the small attendance during October of previous years, to postpone the opening of the shooting season until the first Saturday of November, 1954, when the traps at Bay Ridge will be ready for the members and their friends. The usual handicap holiday events and monthly cup contests will take place throughout the season, and the club will present prizes for the season's best scratch and handicap scores. Men who have never indulged in this pastime are invited by the committee to join in this most healthful and attractive winter pastime.

At the Rising Sun, Md., tournament, held Oct. 5 and 6, the professional high averages were as follows: First, Mr. J. M. Hawkins with 294 out of 315 targets; second, Mr. J. A. R. Elliott, 276; third, E. H. Storr, 258. Amateur high averages: First, Lester German, 268; second, Mr. H. L. Worthington, 267; third, Mr. W. Ford, 262. The Cecil county championship, an event at 20 singles, use of both barrels, and 20 pairs, was won by Mr. H. L. Worthington, with a score of 37. In the sweepstake events the sliding handicap prevailed, which affected the scores somewhat on the minus side.

Mr. W. T. Nash, of Indianapolis, Ind., famous in the world of business and sportsmanship, returned recently from his trip in the Western Wilderness. The members of the party were Mr. Nash, and Messrs. W. F. Kettenbach, a banker of Lewiston, Idaho; Albert and Richard Lieber, of Indianapolis. They had guides and a pack train of about twenty-eight horses, with which to make their journey to the Fish Lake country, where they stayed some days, thence via the Lo-Lo trail to Lo-Lo Springs; thence to Missoula, Mont. Mr. Nash killed a black bear and a grizzly bear, and the Messrs. Lieber killed several elk and deer. Mr. Kettenbach killed his first elk near Fish Lake. Mountain sheep and cougars also were killed. The fishing was an enjoyable feature.

The monthly shoot of the S. S. White Gun Club, held on the club's grounds at Gorgas Station last Saturday drew a large attendance. Mr. Fred Coleman distinguished himself by scoring 96 out of 100, of which the last 50 were broken straight. Mr. H. Buckwalter scored 49 out of 50. For the challenge cup, 25 targets, Messrs. Charles Newcomb and Dr. St. Clair tied. In a twelve-man team match between the home club and the Meadow Springs Club, the scores were: S. S. White team—Brenizer 23, Newcomb 21, Harper 20, Beyer 20, Cantrell 18, Parry 18, Staler 17, Dr. Cutting 17, Denham 17, Witherden 16, Hinkson 16, St. Clair 16; total 219. Meadow Springs—Bush 23, Coyle 23, Hall 22, Roberts 18, Franklin 18, Pepper 18, Parsons 17, Henry 17, Davis 16, Marden 16, Gothard 15, G. Smith 12; total 215.

Mr. E. R. Stilson, concerning the recent shoot of the New London, O., Gun Club, writes us as follows: "I would call your attention especially to a few features covered by our report. You note there were no sweepstakes, and no prizes of any kind. We charged 1 cent per target. I inclose a programme with which we announced our shoot. The scheme is out of the ordinary, and we think the attendance is an index of the way it was received. Furthermore, there are no clubs among the surrounding towns which contain tournament shooters. These clubs are for the most part new, and the shooters are more or less inexperienced. It is our first shoot, and the fact that we trapped 5,000 targets from a quarter to ten with one trap, indicates that there were no delays." The programme referred to, provided twelve events, a total of 150 targets, at a total expense of \$150.

A correspondent sends us the following interesting information: "Mr. Eugene duPont, Manager Central Division of E. I. duPont Company, Wilmington, Del., accompanied by Mr. Dale Bumstead, late manager of that company's office at Pittsburgh, Pa., left Wilmington on Sept. 10 last for a hunting trip in Newfoundland. They arrived back on the 7th, having been gone just four weeks, lacking one day. Their destination was way inside, some thirty miles from the railroad. That thirty miles, Mr. duPont says is equal to about ninety miles of Delaware roads, if you could get as many miles as that out of all the roads in the little Diamond State. Caribou were scarce at first, but later they saw plenty, 140 being counted on the last day. On that day Mr. duPont was lucky enough to secure his third and last head, a perfect trophy, and said to be the banner head of the season for Newfoundland. Mr. Bumstead also secured his three heads, all good ones; in fact, they selected their trophies very carefully, and passed up anything that was not of the best. That they had their troubles is shown by the fact that they had to shift camp nine times, nearly every shift being made in drizzly weather. It might be mentioned in passing that Mr. duPont brought back with him films that contain seventy-two exposures, so that the heads won't be his only souvenirs of the first big game hunt he ever took.

The programme of the World's Fair Handicap, to be held at Du Pont Park, St. Louis, Mo., No. 1, 2 and 3, announces that competition will be open to the world. Interstate rules will govern. Shooting commences at 9:30 o'clock. Hot dinner served from 11:30 to 2 o'clock. Ship shells to Rawlings Sporting Goods Co., 620 Locust street, before Oct. 29. The handicap committee will be selected from the shooters who are present. From the programme we further quote the following: "For those who desire it, we will engage rooms in the city, or we can take care of any or all at Du Pont Park, in tents if the weather permits; if not, the club house will be turned into a dormitory each night. First day, 10 live birds, \$7 entrance; high guns, one money to every four entries. Five events, 20 targets each, entrance \$2. Division of money in target events: Under twenty entries, three moneys; over twenty entries, four moneys. Second day, World's Fair Handicap, 50 live birds, \$50 entrance; handicaps from 26 to 34yds. High guns, one money for every four entries. A forfeit of \$10 must be sent to Mermod & Kenyon, 620 Locust street, before Oct. 15. Post entries, \$55. No entry will be taken nor shooting up allowed after last man has fired at his first bird. Men will shoot in squads of five at 10 birds. If one man is late, that squad must drop out till the next full squad has shot their 10 birds. See that all of the men in your squad are on time. There will be plenty of target shooting to suit those who desire to pass the time while not shooting pigeons. The winner of the World's Fair Handicap will have his choice of a solid silver cup valued at \$100, its equivalent at Mermod & Jaccards, or \$100 in gold coin. Ties for the prize must be shot off at 25 birds." The third day will be devoted to the conclusion of the handicap and the shooting off of the ties, if any there be.

BERNARD WATERS.

Rochester Rod and Gun Club.

ROCHESTER, N. Y., Oct. 5.—The weekly contest for the Hunter Arms trophy resulted to-day in some exceptionally high scores. The event is at 25 targets, handicap allowance, but no score can, with allowance added, exceed the 25. Fraley scored 25 straight, and Stewart, scratch man, missed but one. The scores follow:

Broke. Hcp. Tot'l.			Broke. Hcp. Tot'l.				
Fraley	25	3	28	Stewart	24	0	24
Weller	24	4	28	Borst	17	7	24
Rickman	22	6	28	Hunt	15	6	21
Norton	23	3	26	Clark	16	1	17

WESTERN TRAP.

Garfield Gun Club.

CHICAGO, Ill., Oct. 1.—The appended scores were made on our grounds to-day on the occasion of the second trophy shoot of the fourth series. Dr. Meek, McDonald and Geotter tied for Class A trophy on 23. Dr. Skillman won Class B trophy on 18. Gould won Class C, also on 18. In the cup shoot, which followed, Kamp and Stone tied on 21. Birkland won Class B on 19. Gould Class C on 16.

McDonald and Stone then captained two teams formed by choosing sides. McDonald's team won on 54 to Stone's 44 out of a possible 70.

They then shot another match under same conditions, and same men, McDonald's team again winning, 55 to Stone's 37 out of a possible 60. Only six men shot on each team in last match. Attendance only nineteen.

Oct. 8.—The appended scores were made on our grounds to-day on the occasion of the third shoot of the fourth series.

Dr. Meek and L. Thomas tied for the trophy in Class A on 22. Dr. Skillman won Class B on 23, and Dr. Reynolds, Class C on 20.

After the trophy shoot Thomas and McDonald captained two teams formed by choosing sides. Four matches were shot, and McDonald's team won three of them. In the third match the entire team of five men went straight except for one target, and scored 49 out of a possible 50.

The day was an ideal one for target shooting, and the scores were very good on an average. Mr. Tom Marshall and Mr. and Mrs. Davis, from Paducah, Ky., were present.

Trophy event, 25 targets:

Dr. Reynolds11110111111111011101100—20
McDonald1111101111010010101111—19

Davis1110011011011111101111—20

Team contests, 10 targets per man:

McDonald 9, Marshall 8, Stone 8, Davis 8, Keck 8; total 41. Thomas 7, Dr. Meek 8, Geotter 10, Dr. Skillman 9, Dr. Reynolds 6; total 40.

Team race:

McDonald 9, Marshall 10, Stone 9, Davis 10, Keck 10; total 46. Thomas 10, Dr. Meek 8, Geotter 7, Dr. Skillman 8, Dr. Reynolds 9; total 42.

Team race:

McDonald 10, Marshall 10, Stone 9, Davis 8, Keck 5; total 42. Thomas 10, Meek 10, Geotter 8, Dr. Skillman 7, Dr. Reynolds 6; total 41.

Team race:

McDonald 9, Marshall 10, Stone 7, Keck 6. Thomas 10, Meek 7, Geotter 7, Dr. Reynolds 8. McDonald 42, Thomas 41. McDonald 32, Thomas 33. Fifteen targets: Marshall 14, Keck 11.

DR. J. W. MEEK, Sec'y.

In Other Places.

Oct. 19 and 20 will be held the Grand county fair at Deer Creek, Okla. During that time the gun club will hold a tournament. The announcement is made by T. J. Hartment, president, that there will be plenty of added money. All lovers of the trapshooters' sport are kindly invited to lend their assistance.

One of the prizes at the Jackson, Miss., tournament was a good violin. T. W. Henningway won it. Yet there came no limit as to whether he could "draw a bow" long or short.

Watch for the 1905 Jackson, Miss., tournament, with \$500 added money.

The Urbana, O., Gun Club took "a crack" at the Silver Lake Club, and took the trophy and high gun money. The Urbana men were John Muzzy, Ross Poysell, Will Holding, Scott Cushman and Ed. Holding.

There was a shoot held on Sunday last at Hazelhurst, Wis., at which Jesse Sipes won the championship with 97. Richard Hover came near with 95.

The Rolling Forks, Miss., shooters are getting a mortgage on the Pastel Milling Co., trophy. C. W. Walton and C. W. Clements are sure "getting there." Then D. D. Farr will have to be considered.

Max Witz, of Fort Wayne, Ind., and Hugh Clark, of Wabash, the champions of Indiana, shot another 50 live bird match on Oct.

2, and again made a tie, each getting 45 out of 50. The tie remains unsettled, as the weather would not permit a shoot-off.

The Hermitage Gun Club, of Nashville, Tenn., on Monday last defeated the Cumberland Club for the Peters trophy with 453 to 430 out of 500. The next shoot will be with the Franklin Club.

Ab. Newman captures the medal from Jim Lewis, and yet Lewis won the high average for the day at the all-day shoot of the Owensboro, Ky., Gun Club, held last Saturday. Scores: Newman 45, Overstreet 44, Lewis 42, Bennett 38, Morton 36. Lewis won the Hunter Arms Co. medal.

The season of 1904 was closed by the Traverse City, Mich., Gun Club on Saturday last, and the boys kept on shooting until the moon was up. Charles A. Carver will now have the medal in his possession until the spring opens up. The last squad shot after dark, and made the score, viz.: Darrows 18, Davis 12, Murrell 15, Desmond 18, Norton 6, Miller 12. So 'tis good-by to trap and targets until the sun shines bright in 1905.

The Le Mars, Ia., Gun Club held the last shoot for this fall on Thursday. A team shoot was held in which H. N. Kern won with 125 to Adamson's team with 122.

We now chronicle the reorganization of the Leroy, Ill., Gun Club. There appears to be enthusiasm, and a tournament will be held soon. That part of Illinois, having Peoria for a center, will hold tournaments during the winter.

Wm. H. Heer won the high average for both days at the Atchinson, Kans., tournament. It was good for sore eyes to see "Aisy" Lou Ehrhart run a tournament.

Some inside information comes from Emporia, Kans., that the women have organized a gun club, and will get in practice, so that house-breakers will not be safe in that part of the city where any of the members dwell.

At Fulton, Mo., a gun club was organized among the deaf. It will be known as the Kingdom. The members are W. M. Adcock, J. H. Atkinson, E. M. Bolton, Dr. H. A. Bragg, W. B. Harris, Prof. N. B. McKee, R. A. Moore, B. F. Payne, J. W. Ratikin and E. F. Tucker.

Chicago, Ill., Oct. 8.—The last shoot held by the Grand Crossing Gun Club was well attended. The old Watson Park, where the shoots are now held, echoed as of old with the merry pop of the shotgun.

Jackson, Miss., Oct. 1.—The first shoot given by the Capital City Gun Club was held here the last day of September and was an innovation to the members. The shooters from clubs in all the nearby cities turned out, and they were sorry that there were not two days instead of one. Those well versed in the tournament business consider this shoot remarkable, as there were but few days' notice given. The new club is composed of sportsmen. They put up \$100 all through their own efforts, and without the assistance of the citizens of Jackson. The trade representatives gave much assistance. The well-known Col. Tom A. Divine, of Memphis, and Maurice Kaufman, of New Orleans, were a great pair. The scores as given herewith are considered so good that the makers thereof feel that no other set of men can duplicate them. The contest for the Pastel cup was an exciting one. It has been won on very high scores, and this was no exception, as Mr. W. H. Clements won out on 59 out of 60. The club is now on the way to success, and just watch all the other clubs next year and see if Jackson don't give as fine a shoot as any in the South.

Bloomfield, Neb., Sept. 30.—The much-advertised shoot with a large number of prizes came off here during the past two days, and the management are at a loss to know why the shooters did not come and stay the whole two days. Of course, the shoot was hindered the second day by wind.

H. G. Taylor, of Meckling, S. D., was high man, and his score for the second day is hard to beat, losing but 4 out of 160. The home man, F. H. Graham, of Bloomfield, was not busy the last day with the management, and he lost but 10 the last day.

Loup, Neb., Oct. 1.—During a two days' shoot here, in which 350 targets were thrown, old Dan Bray, the veteran, shone out brilliantly. Only a few shot the entire programme through. Some of the old-timers were here, viz.: Sievers, of Grand Island; Dick Linderman, of Lincoln; Geo. Waddington, of Beatrice; Gus Schroeder, of Columbus. The Sock boys were in evidence, and while they tied on the handicap, yet Waddington went them two better and won out.

Peoria, Ill., Oct. 3.—The regular shoot of the Twin City Gun Club was held Sunday. Owing to the expected rainfall, the attendance was not large. The Peters trophy and the regular medal were pulled off. The dark sky caused scores to be low. A. C. Conner and H. Baker, of Pekin, had a tilt for Class A, which Conner won, with 45 to 43. Class B was won by Geo. W. Herman, with 35. H. H. Martin got 34. There were several visitors present. The Peters medal brought out a prolonged shoot-off between Conner and Baker, the same being postponed owing to darkness.

Cincinnati Gun Club.

Cincinnati.—The tie in the Parker prize gun contest was shot off on Oct. 7. The ten who were in it were on hand, except Hernan, who is still in Minnesota, hunting. The weather was almost ideal. The conditions could not have been bettered. Messrs. Gambell, Van Ness (Don Minto) and Barker, acted as a handicapping committee to the entire satisfaction of all. The event had been well advertised, and the result was a large attendance of club members and friends of the shooters, who thoroughly enjoyed the excellent exhibition of skill and endurance given by the contestants and warmly congratulated the winner.

The first squad went to the score at 2:20, and the match was over at 4:20. Seventeen hundred targets were thrown in the two hours. In the first 100 four men dropped out, failing to make a straight score with the help of their extra targets. This was not the fault of the handicap, but was due to the fact that none of them shot up to their average gait. One dropped out in the second shoot-off at 50 targets, the handicaps being split in two, leaving four still in the tie. Pohlar, after an exhibition of steadiness of which he has a right to feel proud, dropped out in the fourth shoot-off. In this the handicaps had again been reduced to half the previous number of targets. The three who were still left in the game faced the traps for what proved to be the last time, and Harig won with the fine score of 48 breaks, a total of 277 out of the 300 shot at. Randall broke 276 in all, and Norris 248. Norris is especially deserving of commendation for the great improvement he showed. His best score in the series of contests was 77. It was a toss-up between Randall and Harig to the very last. Harig gave a great display of nerve in the fourth tie, when he needed the last 20 to "keep in," and he smashed them all in expert style. Randall also gave a fine exhibition in this round, missing his last target and scoring 49.

The race was unquestionably the most hotly contested and the best which has been shot on these grounds by club members. E. B. Barker referee; Chas. Peters scorer.

Shoot-off in Parker prize gun contest, 100 targets, handicap

added targets. The figures denote handicap, broke and total in the order given:

	Hdcp.	Brk.	Total.		Hdcp.	Brk.	Total.
Randall11	94	100	Kramer28	67	95
Harig14	92	100	Boeh30	53	83
Pohlar19	87	100	Faran13	80	93

Second shoot-off, 50 targets, handicap:

Norris13	39	50	Randall5	45	50
Dick8	38	46	Harig7	46	50
Pohlar9	44	50				

Third shoot-off, 50 targets, handicap:

Randall5	45	50	Norris13	42	50
Harig7	45	50	Pohlar9	41	50

Fourth shoot-off, 50 targets, handicap:

Randall3	49	50	Norris7	44	50
Harig4	46	50	Pohlar5	37	42

Fifth shoot-off, 50 targets, handicap:

Harig4	48	50	Randall3	43	46
Norris7	41	48				

The attendance on Oct. 8 was not up to the mark, only fifteen taking part in the cash prize event. The day was warm and cloudy, and the light was rather poor, but some rather good scores were made.

Four scores were shot in the cup race: Medico 21, 16; Barker 20, Faran 25. He is now king, and his name adorns the bulletin board. There are sixty-five entries for the cup.

Cash prize gun, 50 targets, distance handicap: Barker (16) 46, Norris (16) 45, Maynard (19) 43, Faran (20) 41, Medico (19) 41, Peters (19) 39, Don Minto (16) 39, Ackley (15) 39, Block (18) 38, Miles (17) 37, Bullerdick (16) 37, Lindsley (16) 37, Teddy (17) 32, Pfeiffer (16) 30, Nixon (16) 12.

Notes.

The Cleveland Gun Club has been presented with a handsome sterling silver cup by the Bowler & Burdick Co., to be known as the Cleveland Trapshooters' Handicap trophy. Ten contests at 50 targets must be shot to decide the winner. The shooters will be divided into classes, so that all will be on as nearly an equal footing as possible. The first contest was shot at the grounds in Mayfield road, Oct. 8.

The members of the Rohrer's Island Gun Club, of Dayton, had a pretty day for their medal shoot on Oct. 5, and there was a good attendance of shooters. Harry Engle won the contest after shooting off a tie with Lockwood and P. Hanauer, both of whom qualified with scores of 25 or better. This is his third win, and he stands a good chance of catching up with the leaders. Joseph Hohm, the oldest member of the club, did some good work, breaking 47 out of 50. After the medal race, two team matches were shot, Miller and Hanauer captains.

Judge John Roehm, a Dayton shooter, has been duck hunting at St. Mary's Reservoir, and in addition to the ducks, he killed a fine cormorant, which he will have mounted.

The Dayton Sharpshooters are preparing to erect a house on their range at Dayton Gun Club's grounds. J. Charles Hahne has drawn the floor plans.

Judge Marcus Shoup and John W. Eichelberger have returned from their hunting trip to New Brunswick, bringing home two fine moose heads, the antlers measuring 51 and 53 inches respectively. The animals were shot by Judge Shoup and Byron Stedman. Stedman and Ed. G. Sander, who started with the party, are still in the woods.

Adam Schantz and Wm. H. Orth will go to Mississippi, deer hunting.

Louis Groneweg and a party of friends have gone to Maine for a month's big-game hunting.

D. J. Holan, who has served as deputy game warden for over two years, has resigned his position.

The Portage County Gun Club held a two-day tournament at Kent, O., on Oct. 4 and 5, which was well attended. On the first day twelve events, at a total of 140 targets, were shot, high gun going to Fisher on a score of 129. Charlie Young and Rolla Heikes tied for second on 128. Snow was third with 127. Thirteen events at a total of 150 targets were run off on the second day. High gun for the day went to Snow with 138. Brady second with 136. Fisher third with 135. Young, Heikes and Trimble tied for fourth on 132 each. High average for the two days was won by Snow with 265. Fisher second with 264. Young, Heikes and Brady third with 260 each. Trimble fourth with 255.

BONASA.

IN NEW JERSEY.

Montclair Gun Club.

Montclair, N. J., Oct. 8.—Some seventeen men faced the traps to-day. Messrs. Sim Glover, Thorne and Prest were the guests of the club. Messrs. Glover and Engle tied for first place in Event No. 1, both breaking 23.

Event No. 2 also was productive of a tie, Messrs. Kendall and Glover both breaking 25 straight.

Events 3 and 4, best score at 50 birds, prize a gold watch fob presented by Messrs. Schoverling & Welles, to be shot for during the month of October were won by Mr. Geo. Batten with a score of 47.

The longest consecutive run during the afternoon was made by Mr. Kendall, who broke 35.

The club has offered a silver loving cup to the member who makes the longest consecutive run between now and New Year's Day.

Cecil County Tournament.

RISING SUN, Md., Oct. 7.—The fourth annual Cecil county tournament for amateurs was held here on the 5th and 6th inst., and proved one of the most successful shoots ever held in this end of the State. The county shooters did not turn out as well as expected, but there was a fair showing, especially on the first day. The shoot was under the management of H. Linn Worthington, and everything came off in good shape, without a hitch of any kind. The trap worked fine, and the targets were good breakers and thrown at an even flight of 50yds.

The office was in charge of Lewis R. Kirk, of Ardmore, Pa., and was conducted in a most satisfactory manner. The referee and scorer were the Hoover brothers, of baseball fame, and Reynolds, the crack Cecil county pitcher, also scored. We had in the expert class Mr. J. A. R. Elliott, J. Mowell Hawkins, Mr. Emery H. Storr, Mr. Hood Waters and Mr. Frank E. Butler. Mr. Hawkins walked away from his field in this class winning the average hands down. Elliott was second, Storr third, Butler fourth. German beat Worthington 1 target for the amateur average, with Ford third and Burroughs fourth.

Oct. 5, First Day.

The first day opened with a clear sky and pleasant weather, but there was a southwester a-coming over the trap, which kept everybody guessing, and lowered the scores. Then again the sliding handicap had the shooters to the bad, and Hawkins let ten of them slip away from him, while the rest of the bunch were not even in sight. Right here was where Capt. Jim Malone landed his bumps, and won the amateur average for the day, with 153 dead ones out of the 180. Poor Hood Waters was clean to the bad, but he certainly had an excuse if any one ever had. His eyes were in bad shape, he having caught cold in them. He should not have shot at all. The scores:

Sullivan	13	...

Oct. 6, Second Day.

Threatening weather, with some rain, cut the attendance away down, but by noon there was a goodly bunch plugging it at them. Hawkins again won the average in his class, while Worthington led in the Cecil county championship for the L. C. Smith cup. This event, which was last on the programme, was as near like a good horse race as anything could well be. The first heat of this race was at 20 singles, use of both barrels, and the second heat at 10 pairs. Worthington went straight in the first alone, with Gifford a strong second with 19. In the next lap at the doubles, Worthington dropped 3 out of his first 8, and Gifford, straight up to then, had him heat; but Worthington went on to his last 12 like the proverbial lot of bricks, and finished with 17; total 37. Gifford lost his nerve in the last and finished with 35. The scores for the second day, with the championship scores in detail, follow:

Events:	1	2	3	4	5	6	7	8	9	
Targets:	14	13	13	14	12	13	14	12	15	120
Elliott	9	12	11	13	8	11	11	12	12	97

New London, O., Tournament.

NEW LONDON, O.—The first annual autumn shoot of the New London Gun Club took place at the club's grounds, Sept. 30, under most favorable auspices, and is considered by all those persons who participated in the events as having been a very unique, helpful and successful affair. More than fifty shooters, including the professionals—Heikes, Young, Trimble, Le Compte and Cross—stood on the firing line, while several hundred spectators from near and from far, among whom were many women, encouraged the shooters by their hearty and generous applause. Excepting a high wind part of the time, the day was perfect, and the more delightful because no accident or mishap marred the occasion. Every detail of this shoot was mastered by the management in advance of the coming of the shooters, so that the day's programme was carried out without any delays, only the day was too short for the occasion. Five thousand targets were thrown from a Leggett trap. Five large tents pitched in a semi-circle, with automobiles, carriages and a throng of well-dressed and well-behaved spectators, all of whom were in the best of humor, gave the occasion a gala day appearance.

There were ten events of 10 and 15 targets alternately. There were no sweepstake events on the programme, and no prizes either in cash or merchandise offered. Excepting this, the shoot was conducted along tournament lines. An entrance fee of 1 cent a target was charged.

The principal object of this shoot was to give encouragement to the coming shooters, in this part of the State, at little expense, who hitherto have absented themselves from tournaments wherein sweepstake shooting with prizes of merchandise or cash made a bid for patronage, because of their inability to compete with the more experienced and better shooters. The plan of this shoot worked perfectly, to the complete satisfaction of the large number of shooters from various points in northern Ohio, who were present and took part in the events, and to the management of this tournament, who devised it all.

Following is the list of shooters and their scores:														
Events:		1	2	3	4	5	6	7	8	9	10	Shot	Per

Homer—Ogden Tournament.

HOMER, Ill.—The dedication shoot of the Homer-Ogden Gun Club, held at Homer, Ill., Sept. 28 and 29 was a decided success, both in attendance and the matter in which it was conducted.

The new club house was not as nearly completed as the boys would like to have it, but it answered the purpose.

The first day twenty-seven shooters faced the traps. W. R. Crosby won high expert average, and C. B. Wiggins the amateur average. E. M. Stoner won the handsome gold medal for the highest score in the two last events of 25 targets each.

The second day twenty shooters were in attendance. Mr. Crosby again landed the high expert average, and Dr. E. P. Lawrence, of Lincoln, Ill., made the high amateur average.

In the 100-target race for the gun, C. B. Wiggins was the lucky man with a score of 90 from the 20yd. mark.

Merchandise prizes were distributed to the lower averages. The Homer-Ogden squad made a good showing for the home club.

The targets on the second day were something fierce. Crosby broke 106 out of 125 and Lawrence 104 out of the same number the second day.

C. B. Wiggins won the general amatcur average for the shoot. W. H. Clay, of St.

THE SOLITARY SPORTSMAN.

THERE is a type of good sportsman, the exemplar of a large number in the aggregate, who, year by year, carefully plans his hunting or fishing trip with a view to its solitary enjoyment. He parades neither his preparation nor his going. He has memories of prior trips which were devoid of pleasure because of disagreeable companions. Therefore he avoids all party prearrangements. If he has still a longing for companions to share his pleasures, he is satisfied with the transient companionship which chance may bring to him as an incident of his trip after it has practically begun. He then is free at all times to readjust according to his humor, a privilege denied to him when he is formally a member of a party.

There may be exceptional instances in which a sportsman may shun companionship from motives of selfishness alone, but his number is so small as to be a negligible quantity.

The sport of field and stream has still enough of delights to engage the keenest interests of the solitary sportsman; but to him a pleasure divided has come to signify that some selfish companion has monopolized it all. Formerly there was a stage of his preparation in which his friends were consulted and invited and assisted, all done with an exaltation of spirit, a generosity of purpose and anticipations of common enjoyment, and thus any subsequent heartburnings were all the more painful and deterrent.

It is a common assumption that, as a matter of course, if friends discover as a conversational fact that they have a liking for a special sport, they will enhance their sport by their agreeable companionship if together in its pursuit. In theory, this is specious; in practice, it proves to be lamentably erroneous.

Experience teaches that the character of a man as established and regulated in every-day life under constant conditions and in the midst of abundance, is extremely poor data from which to forecast his companionable qualities in the dearths and hardships of a fishing or hunting trip. In ordinary life, any selfish want may be soon satisfied. In fishing or hunting there may not be sufficient sport for one, but what there is must serve for all. Every experienced sportsman knows all this, and that, however large his acquaintance may be, there is always a dearth of desirable companions from whom to choose. After a certain amount of painful experience, the average good sportsman ties to one or two sporting cronies for companionship. In the course of time they are lost by the mutations of life. None others, according to agreeable companionable standards, can fill their places. And in such happenings is found the genesis of solitariness in sport.

The solitary sportsman as a rule is the most patient, forbearing and obliging in all his associations.

There are several other distinct types of sportsmen who, when put to the test as companions, quickly and permanently contribute to the numbers of the lone sportsman. The one common to all forms of sport is the constant grumbler and calamity prophet. His peevishness, selfishness and pessimism are ever active. He arrogates to himself the privilege to domineer, to object, to protest, to obstruct, to sulk, to be waited upon, to be consulted and made much of, to loaf, to appropriate for himself the best of everything—in short, to indulge his refractory disposition with everything excepting a cheerful face, a pleasant word, and a hearty co-operation in the common purpose with his companions. This kind—an incubus to any form of companionship—is especially a grievous infliction in camp life because of the camp members' constant propinquity. To him may justly be conceded the highest efficiency in graduating the lone sportsman.

He whose sport is with dog and gun has his peculiar troubles. He is a constant victim of the effusively amiable friend who loves practical sport at the expense of his friends.

The amiable friend may know nothing concerning the care and use of dog and gun, yet he borrows them unctuously, returning the one foul and rusty, the other wild and worn. The average hunting companion is prone to the doing of unpleasant things. He is likely to invite himself. He is more likely to be in a state of chronic excitement after the hunt begins, and therefore to be a source of danger. He nervously orders his friend's dog about regardless of the fact that he, by doing so, is offensively unsportsmanlike. He roars cautions to the dog when

the latter is drawing on game, and if his hullabaloo flushes the birds, he frankly attributes their flight to the stupidity of the dog. A point is the signal for him to walk or run to the dog in a straight line, to walk over the dog, to kick the grass under the dog's nose, to hold his gun so that it will bear on man and dog at every turn, to shoot always, and to be imbecile and lawless and selfish in general.

When hunting for birds, the utmost quiet is essential to the best success, yet one may have a companion who whistles rag-time, who is offended if cautioned, or who must babble or perish. He promotes solitariness in hunting.

A desirable fishing companion is more difficult to discover than any other kind. The babbler, the professional borrower, the grumbler, the swinish pretender, are each and all great promoters of solitariness in angling.

THE BUFFALO IN NEW HAMPSHIRE.

THAT is a most interesting picture Mr. Bayne gives of the Corbin buffalo herd in the Blue Mountain Forest of New Hampshire. It is gratifying and suggestive. Such a report of progress and success in the actual establishment of a buffalo herd in New England will come as a surprise to those who have lost sight of the recent developments of the Corbin enterprise. It suggests that what has been done here might be done elsewhere. If Blue Mountain can have a successful buffalo range, other mountains may have them as well. It is commonly said, and in many respects is quite true, that the buffalo had to go because the range it occupied in the old days was wanted for cattle ranches and farm lands. But in these later times, in one State and another, we are setting apart parks and forest reserves; and in this way room is making for the buffalo, where he may live his life unvexed by settlers envious of his pastures. Michigan and Minnesota ought to have buffalo in their State parks. When the Appalachian National Park shall be won from Congress, as it may be this winter, there will be great opportunities within its boundaries for the restoration of the buffalo to a longitude it knew when Walter Raleigh came to Virginia. And so here and there over the country may be provided breeding grounds where with intelligent encouragement herds may be propagated. We have long been accustomed to speak of the buffalo as a vanished race. It has not vanished utterly. Whether it shall survive or perish will depend entirely upon the existence or lack of interest, public and individual, sufficient to preserve the race. We shall print next week a communication from a Western correspondent in exposition of the theory that the buffalo were not wiped out by the skin-hunters, but perished during the hard winters.

FOR LIBRARY WALLS.

THE walls of a restaurant in the lower part of New York city are hung with an extensive series of Audubon bird portraits, of the edition lithographed by Julius Bien. They make a magnificent display, and to many persons among the thousands who visit the place in a day they must be a source of delight. One reflects involuntarily upon seeing them that there might well be such displays of Audubon in every public library in the land. But Audubon sets are rare; so scarce, indeed, that to the average library the opportunity of procuring them is not likely ever to come. There are, however, available pictures of bird and other life, and far-sighted library management may wisely make provision to secure them now.

One library has already taken the lead in such work. Richmond Hill, Long Island, is building a new library, and in the plan provision is made for the display of the series of colored plates of fish and game of the State published by the Forest, Fish and Game Commission. The plan is to have the plates as a permanent part of the structure; they are set in the walls at the height of the eye for convenient inspection; and each picture is supplemented with a concise scientific description. By this admirable arrangement, important and valuable instruction will be given, not only to the present generation, but in future time as well; and the popular information thus disseminated must have the effect of awakening interest in natural history, and of fostering public appreciation of fish, game and bird protection.

The Richmond Hill plan is of such merit that it might well be followed elsewhere, not only in New York, but in every State where such natural history prints are avail-

able as published by the Legislature. For that matter, library authorities would no doubt find no difficulty in securing sets of the New York pictures, and, with respect to many of the species represented, these would answer for other States.

BUSINESS OPPORTUNITIES.

ONE part of the duties of American Consuls in foreign parts is to note openings for trade and "business opportunities" for Americans, and these are announced from time to time in the daily consular reports issued by the Department of Commerce and Labor. A current report comes from Consul E. H. Plumacher, who writes from Maracaibo, Venezuela, that there is an opening in that country for the American alligator hunter. Now that the supply in our southern lagoons and swamps has been reduced to such an extent, Consul Plumacher's suggestion will likely tempt the skin-hunter's enterprise. The alligators infest Venezuelan lakes and lagoons and rivers "in untold numbers and of all sizes," the report runs. "The skins are well worth securing, and alligator oil brings a high price, being used for medicinal purposes. In the Rio de Oro and the Rio Tarra I have seen thousands of large alligators which came up to deposit their eggs on the sand banks during the dry season. It is the same in all the hundreds of streams which flow into the lake of Maracaibo. Alligator hunting is fine sport, and, in my opinion, would be a paying business." The "sport" feature of it, we venture to remark, is not to be commended; the alligator is no longer recognized as game; but as a purely business proposition, Mr. Plumacher's "business opportunity" should have respectful consideration.

The alligator skin-hunter need not go so far as Venezuela; there are limitless opportunities awaiting him nearer home; the south coast of Cuba has a supply that would stock the alligator leather market for years to come. It awaits only the exploitation of American enterprise. A vivid picture of the plentitude of the creatures is found as an unexpected bit of wild life and adventure among the dry statistical charts and tabulations of the Cuban census, in the report of the enumerator who was commissioned to collect the statistics of the vast swamps of Zapata, on the south coast.

The enumerators set forth equipped, as was fitting for census takers in that particular district, with repeating rifles, 200 rounds of ammunition, revolvers, machetes, bowie knives, shotguns with ammunition for them, and rations for six days. The arms and ammunition were for the provision of food, and for protection against the crocodiles and alligators, which were so numerous and offensive as to keep the members of the little party constantly on the defensive. On the second day out, when they had fairly made their way into the swamp, they killed a number of crocodiles measuring from three to twelve feet; and the night that followed was "unpleasant and spent on guard, because crocodiles followed our party to camp, four of them advancing to our mosquito bars, which we killed with great trouble." The next night, camping on an islet, they were followed again by crocodiles, with which they had an encounter lasting two hours before they succeeded in dispersing them, and could lie down to sleep. On the day following they killed nine crocodiles, measuring from nine to sixteen feet, and spent the night on an island where, by reason of many crocodiles infesting it, they could get no sleep because "it was necessary to be on the lookout." The next night "we slept in a stockade of palms, a defense which it is customary to make in order to avoid an attack of the crocodiles which prowled about during the night. At daybreak we were surrounded by a large number of crocodiles; our position being somewhat difficult, we succeeded in killing four crocodiles, using all our ammunition, and by the use of our machetes we were able to reach some trees, and through their branches traveled a distance of forty-five feet, and were now out of danger." Another morning they awoke to find four crocodiles surrounding the stockade they had built the night before for their defense; and these they had to despatch or disperse before starting out. Surely these census takers deserved well of their country. The returns do not show whether more alligators than human dwellers in the Zapata were enumerated. It is manifest that there are still wild regions where the contest between man and brute is a strenuous warfare. Zapata swamp dwellers would doubtless welcome intervention by American skin-hunters.

THE SPORTSMAN TOURIST

Trackers of the North.

WHAT appears marvelous and positively uncanny to a town person is simple to a bushman.

Years of continuous observation develops the bump of locality, every object has a place and meaning to a trapper; his eye is ever on the alert, and what his eye sees is photographed on the brain and remains there for future reference at any time he may require it.

This bump of locality is highly developed in all Indians and whites who have passed many years in the bush. Without the faculty of remembering objects a bushman could not find his way through the dense forests.

Providing the trapper has once passed from one place to another, he is pretty sure to find his way through the second time, even if years should have elapsed between the trips. Every object from start to finish is an index finger pointing out the right path. A sloping path, a leaning tree, a moss-covered rock, a slight elevation in land, a cut in the hills, the water in a creek, an odd-looking stone, a blasted tree—all help as guides as the observant trapper makes his way through a pathless forest.

Of course, this tax on the memory is not required of trappers about a settled part of the country, but I am telling of what is absolutely necessary for the safety of one's life in the far-away wilds of the North, where to lose one's self might possibly mean death.

I followed an Indian guide once over a trail of 280 miles, whereon we snowshoed over mountains, through dense bush, down rivers and over lakes. To test my powers of a retentive memory, the following winter, when dispatches again had to be taken to headquarters, I asked the Indian to allow me to act as guide, he following.

On that long journey of ten or twelve days, always walking and continually thinking out the road, I was in doubt only once. We were standing on the ice; a tongue of land stood out toward us; a bay on either side. The portage leaving the lake was at the bottom of one of these bays, but which? The Indian had halted almost on the tails of my snowshoes, and enjoyed my hesitation, but said nothing. To be assured of no mistake, I had to pass over the whole of last winter's trip in my mind's eye up to the point on which we stood. Once the retrospect caught up with us, there was no further trouble. Our route was down the left-hand bay.

When the Indian saw me start in that direction, he said: "A-a-ke-pu-ka-tan" ("Yes, yes, you are able").

The most difficult proposition to tackle is a black spruce swamp. The trees are mostly of a uniform size and height, the surface of the snow is perfectly level, and at times our route lies miles through such a country, and should there be a dull leaden sky or a gentle snow falling, there is nothing for the guide to depend on but his ability to walk straight.

It has been written time and again that the tendency when there are no land marks is to walk in a circle.

By constant practice, those who are brought up in the wilds acquire the ability to walk in a straight line. They begin by beating a trail from point to point on some long stretch of ice, and in the bush, where any tree or obstruction bars the way, they make up for any deviation from the straight course by a give-and-take process, so that the general line of march is straight.

During forty years in the country, I never knew an Indian or white bushman to carry a compass. Apart from a black spruce swamp, it would be no use whatever.

In going from one place to another, the contour of the country has to be considered, and very frequently the "longest way round is the shortest way home." A ridge of mountains might lay between the place of starting and the objective point, and by making a detour round the spur of same, one would easier reach his destination, rather than to climb up one side and down the other.

On the first day after my arrival in London (the only time I ever crossed the water) a gentleman took me out to see some of the sights. He lived on the Surrey side, and took me direct, or, I should say crooked, into the city across the Thames. After walking me around several blocks and zigzagging considerably about, he came to a sudden stop at a corner. "Now," he said, "Hunter, suppose I was to disappear all at once, do you think you could find your way back to Elm Tree Lodge? I have always heard that you bushmen can find your way anywhere."

Now, although there was no necessity for it, my years of schooling had caused me to observe every conspicuous object, and every turn we had made since leaving his residence; and therefore I replied, with the utmost confidence, "Why, to return to your house from here is as simple as falling off a log."

Looking at me with the greatest incredulity, he said, "If you can find your way back unaided I will pay for the best hat in London."

"Well, my dear sir, my number is 7, and I want it soft felt and dark bottle-green. Now follow me, and you can get the hat in the morning."

Without going into details, suffice it to say, I conducted him to his own door, and a more perplexed man was not in London; so much so, he had to call

in his wife, his mother-in-law and his next door neighbor to tell them of my achievement.

At last I had to cut short his flow of words by saying my guiding him home was a most simple thing. It was merely the result of observing as I went along, and running the objects backward as I came to the house.

"If I was to tell you as a fact, my dear sir, that a bushman sees the track of some wild animal in the snow, he can tell you not only the name of the animal, but if it was male or female, within an hour of the time the tracks were made, if it was calm or blowing and the direction of the wind at that time and many other minor things, you would think this wonderful. Yet, as wonderful as this may appear, and hardly to be credited, an Indian boy of ten or twelve can read this page from nature as easy as one of us can read a page of print."

MARTIN HUNTER.

The Arkansas Market Hunter.

LICENSE a safe-blower to ply his craft on Wall street, with the condition that he takes only the silver dimes and leaves other coin and collateral untouched, and possibly his dissatisfaction will equal that of an Arkansas market-shooter under the present State laws. Any professional man would dislike giving up a paying general practice to become a specialist with a smaller income; but the market-gunner is permitted no choice in the matter. He can ship no game outside the State, nor sell at home anything save bear, rabbits and squirrels. Undoubtedly Arkansas has still a good many bear, but their habitat is the canebrake and swamp, where successful still-hunting is impossible and dogs can be used to little advantage. Bear tracks can be found any summer or fall within a dozen miles of my home; yet, during the fifteen years since I first hunted in this territory, not more than four or five bears have been killed—the last one in 1899. Consequently, the hunter's sole chance is now in squirrel shooting, since rabbits are hardly salable in Southern markets, except to darkies, and many negroes will eat them only in the winter months. So we find the market shooter ranging the woods in quest of gray and fox squirrels, and supposedly unmindful of other species of game. The reader will take note of this word "supposedly." Coveys of quail may flush from under his feet; deer stare at him down the forest trails; turkeys "tree" in the surrounding oaks and gums, and the quacking of mallard and whistle of woodduck signal the vicinity of lake or stream; but he is supposed to keep his mind strictly on squirrel, and his finger off the trigger until said squirrel is discovered, for it is a matter of principle with the market-hunter to shoot nothing that he can't sell. He may feast, if he so pleases, on venison steak, fried turkey breast, and broiled woodcock, and quail; but he must not yield to temptation and ship his surplus birds in egg cases to Memphis or St. Louis, nor can he pack a trunk with venison saddles and intrust it to some friend bound to the World's Fair. However, he can give away as much game as he likes, and the generosity of our market-gunners as a class is something remarkable. During the duck flight, last fall, roast mallard became as common as fried sowbelly, and it was reported that one enterprising shooter, with an unusually long list of intimate friends, even hired men to assist him in keeping their tables supplied. Idle report, mind you—a mere rumor—that could by no possibility be traced to its origination. Not a conviction have I heard of under the new law; not even a prosecution, or as much as a complaint. And what does that prove? Why, that our market-gunners are a nice lot, superior to temptation and without guile. But they are death on squirrels.

Bald Knob is situated on the St. Louis, Iron Mountain & Southern Railroad, at the very dividing line of flat lands and hills. Westward, clear to the border of the Indian Territory and beyond, nothing but ridges and valleys, limestone, sandstone and flint pebbles; eastward, to the Mississippi River, ninety odd miles away, approximately a dead level expanse, with hardly a rock big enough to throw a dog. Hardwoods on the hills; the bottomlands covered with a giant growth of oaks, hickories, gums, cypress, etc., with abundant and dense undergrowth. Twelve miles to the east lies White River, and four miles to the south the Little Red, both navigable streams, their junction point some thirteen miles to the southeast. From the limited territory within this irregular triangle, squirrels have been shipped about two-thirds of each year since 1894, the shipments each day in the week ranging from 100 to 250, with a probable average of about 125—something over a quarter of a million in all, as a mome's figuring will show you. Until last season, other game in fair quantities was killed for the market, principally deer, turkeys and ducks; but even approximate data of the gross amount is not obtainable. Several years earlier than the date above mentioned—during the season of 1888-9—I know that seventy-three deer were killed within the triangle in question, and there were probably others that I heard nothing about. Possibly I should add that at no one time, to my knowledge, have there been more than five or six market-hunters shooting in this territory; that four dozen squirrels to the gun is by no means an unusual score for a single day, hunting in the morning and evening, and that the record at pres-

ent stands at seventy-six—credited to the redoubtable Zeke, whose camp I recently visited and will now proceed to describe.

Kings are born to the purple; Arkansas market-hunters have as their heritage the green woods, the inspiration of dad's old gun above the mantelpiece, and the droning repetition of hunting yarns of the long ago, and the intuitive knowledge that dad's old hound always leads in the chase and never—no never—barks up the wrong tree. They commence hunting by the time they have outgrown dresses, keep it up as long as there is chair room awaiting them at the parental board, and when at last forced to take up some regular employment as means of earning a livelihood, they choose—hunting. I have yet to meet a market-hunter who has turned to that calling from any other, or who would leave the woods and a life of hardship, exposure and frequently semi-starvation for the best-salaried indoor position that one could offer him. Their choice of occupation is doubtless a foolish one; but who is to judge and condemn them for it. Certainly not the sportsman, who, for the mere fun of the thing vainly strives to match them in endurance as well as in skill. Nor the law-makers, who might, but do not, make their arduous calling impossible. Most assuredly not the writer of these lines, who has shared their hospitality many times in the past; hunted with them, and found them in no wise deficient in field courtesy and the ethics of true sportsmanship. Are the market-gunners of other regions cast in a different mould? Possibly not; yet, while the innate gentility, sturdy manliness and general lovability of moonshiner, smuggler and poacher have inspired the pens of novelists without number, and which is more to the point, been accorded recognition by their sworn enemies, the game-keepers, United States marshals and excise officials—when did a sportsman's journal omit qualifying adjectives more or less derogatory and offensive in mentioning the man who shoots for the market? He is as avaricious as a gold miner, as sordid as a bank president, as regardless of the rights of others as the homesteader who gobbles up a whole quarter section of public domain. Maybe all his incomings and outgoings are not strictly legitimate in the eye of the law; but he cloaks them under a lawful calling, and there are others, equally culpable, who get a whole lot less of blame. Time and again I have discussed with Zeke the need of game protection. He knows that I would gladly see his occupation legislated out of existence. He knows too, that I do not blame him for continuing in business so long as the law permits. The best policy in dealing with woodsmen is one of perfect frankness, whether you have to do with a market-gunner who is not a law-breaker, or pork eaters and timber cutters who keep clear of the penitentiary because of the difficulty of getting the right sort of evidence against them. Let them one and all know exactly where you draw the dividing line between right and wrong, and you will find them jolly, good hunting and camp companions, and not given to embarrassing confidences, which you might later have to repeat to an inquisitive grand jury. Perchance, even in the big cities, one might find an occasional person with business secrets to be jealously guarded from a prying public. I have been told that such is the case, and have no reason to doubt the veracity of my informants.

I found Zeke's party camped at Beaver Pond, some seven miles from town. More accurately speaking, I found the camp. The hunters had been away since early dawn, and the constant popping of shotguns from one to two miles distant showed that they were busily employed. A wisp of gray smoke, lazily ascending from a bed of dying embers, led me to the spot where four men had made their home for as many weeks. No cabin or tent; nothing ever so remotely resembling a shelter from sun and dew, save the spreading branches of a big white oak overhead, and the thick foliage of encircling saplings. Four stakes had been driven in the ground, supporting a rough board, which served as a table. A few cooking utensils were hanging from nails driven in the oak—a frying pan and three smoked and battered tin buckets. On the bench I have mentioned were a galvanized iron water pail, two tin cups and a single tin plate, and a worn and phenomenally dull butcher knife. Three soiled and tattered quilts were rolled together and thrust in the fork of a sapling; sundry coats and overalls hung here and there; a little sack held the supply of salt and coffee safely above the reach of visiting kine. This was all, save that among the branches of a bush not more than shoulder high casual scrutiny discovered several loaves of bread and a slab of the never-to-be-forgotten sowbelly. "The dogs can't git up thar," one of the boys told me later on, "an' these flatwoods cows won't eat baker's bread." Students of natural history will please stick a pin here. The discovery is of recent date, for only last year it was rulable to elevate the grub to the seven-foot level.

A gray pony stood tied to a tree nearby, its hips and shoulders stained with blood as evidence of its daily trips from the camp to the railroad station. Against another tree leaned a bicycle, valuable when the state of the roads permitted, for trips requiring speed. I bitterly resented the introduction of bicycle and baker's bread in this otherwise perfect picture of a forest bivouac; but the contaminating touch of modernism

works havoc everywhere in the present day and time, and that which can't be helped must be endured.

Presently the hunters commenced straggling in, each heavily burdened with game. The first comer counted twenty-three squirrels as he unstrung them from the thong which had crossed his shoulder, and later arrivals had averaged as well; but it was generally conceded that Zeke's score would prove best. "His gun is a 10-bore," said one. "An' he can beat us shootin'," added another. "An' kin see squirrels the rest of us can't find," supplemented a third. All this was no news to me, for I have hunted side by side with Zeke, and know that his big repeater can be depended upon for a 90 per cent. gait, while no man in the country will burn more powder on the same ground and in the same length of time. He brought in thirty-three squirrels, and reported them growing very scarce and wild. I presume that Northern and Eastern squirrel hunters will smile incredulously at this bare statement of facts; but let them spend a season in the Arkansas low grounds, and, as the writer has done before now, shoot down twelve and thirteen squirrels before taking time to gather them for a count, and they will be ready to accept without murmur statements more remarkable still.

As the time was early in September, and the weather very warm, the game had been drawn as killed. Later in the season, this work will be deferred until camp is reached, and then the hunters will feast upon fried squirrel liver. I recall making one of a party of seven very hungry men who attacked and demolished a fricassee of ninety-five livers. We thought them very good, and they certainly served to sustain life until a twenty-pound gobbler could be roasted and the accompanying side dishes prepared. Had we been market-hunters, the turkey would have been sold and the proceeds invested in "good old greasy hog meat." But this is a digression. Ten minutes after Zeke's coming, the squirrels, duly counted and bundled into a gunnysack, were resting on the withers of the gray pony, with a sturdy rider in the saddle, whipping and spurring toward town. And in ten minutes more Zeke was following on the bicycle with a dozen big-mouth black bass, freshly taken from the live box, resenting with flops and gasps the coating of ashy dust which speedily covered them as they dangled from the frame. Another half hour would see them on the local market freshened and revived by a bath at the town pump. They had been caught the evening before, on a Skinner spoon, in this little mud hole of a beaver pond, which covers a scant twenty acres and shows a dry-weather depth of not more than three feet; yet there were 5 and 6-pounders in the lot, and more of the same sort would be taken the following evening, and five days out of six for weeks to come.

Squirrels and black bass! Truly, evil days have befallen the Arkansas market-hunter when he must content himself with such small fry. The first of them I ever knew—quaint and kindly old Ganoway Malcolm, the Raft Creek philosopher—would never consent to waste a bullet on game smaller than deer or turkey; and it was because of his adherence to this rule that I lost the good opinion of his wife. The pair were childless, and in their old age had adopted an orphan boy, a sickly, peevish six-year-old, who was idolized by the old lady and petted and whipped in turn by her usually kind-hearted but sometimes irritable husband. "Pinky" was a dainty feeder, and his appetite frequently craved delicacies the family larder did not afford; so, in time, there came a demand that old Ganoway positively refused to supply. The boy wanted "squirrel heads," and as I was passing the cabin on my way from camp to the deer crossing on Dick's Point, Mrs. Malcolm hailed me with a request, which, as it afterward transpired, I did not fully understand. On my return that evening I brought her six plump young squirrels. I had taken pains in their killing, and the head of each and every one was either missing or torn into fragments. The good lady was too angry to accept explanations, and I am well assured that she never forgave me.

Malcolm taught me many tricks of the deer hunter's craft; among the rest, that there were other ways to stop a running deer than by whistling or bleating at it. His own method was to call out, as though addressing an old acquaintance, "Hello, old man!" "Hi, thar, gal!" or "Run, you little devil!" varying the summons as the age and sex of the subject demanded, and timing it so exactly that the deer would always halt in a clear spot, where there was nothing to obstruct the shot. Judged by the standards of to-day, Malcolm was not a market-hunter pure and simple, for he followed trapping in its season, cut and rafted logs when offered what he considered rightful pay as an expert hand, and of the game he killed, the greater part was consumed by the family and their numerous guests. Hide hunting was his specialty, and his harvest time came twice each year: once early in the winter, when the annual overflow ran the deer from the low grounds to the flat woods, along well defined routes of travel, affording the best of opportunities for bushwhacking; and again late in February and early in March, during the buffalo gnat season. Of late years the buffalo gnats have noticeably decreased in their numbers, and there are springs when they are noticeable principally by their absence; but in the early '80s they were a scourge to be dreaded, making life an endless misery for every four-footed creature within the territory where they abound. Deer and domestic animals frequently succumb to their attacks. The planters and woodsmen owning horses and cattle practice keeping "smokes" burning near their dwellings during the time the buffalo gnats have the country in keeping, and to these smouldering stumps and log piles come the tortured stock and wild creatures, and there remain, even starvation failing to drive them away. So, in the buffalo gnat season Ganoway built his smokes in the woods roundabout, marching along his beat from one to another, and killing anywhere from one to five and ten deer a day. It was while thus engaged that he sighted and shot something that he used to describe as "a master big deer, taller'n my Molly mule (a good 15 hands high) an' heavier'n four deer orter be." The creature was a male, but had shed its horns. A square timberman who saw it was positive that it was an elk, but admitted he

knew nothing save from hearsay of how an elk should look. But an elk it was from that day, according to Malcolm and his fellow woodsmen, and an elk it will remain in the traditions of that region; however, from personal knowledge of Ganoway's love for exaggeration in yarn spinning, I hold to the theory that it was about a 250-pound buck—out of the ordinary in size for Arkansas, where the average big deer runs about one-third lighter.

The old man steadfastly refused to see aught reprehensible in that "smoke shooting" at a season when deer were thin in flesh and unsuitable for food, and when closely pressed, was always ready with the market-gunner's unfailing argument, "The law says it's right, and I might as well get them as some one else." But later events furnished irrefutable proof that Malcolm's implied respect for the law and its mandates was merely a convenient fiction. Arkansas at last gave her deer the protection of a close season, and my aged acquaintance was the first man to suffer for its infringement. One day in July the habit of a lifetime asserted itself, and a nice young buck fell at the salt lick where so many had fallen before. A half-mile away lived a widow, Mrs. Citterdene, lone, friendless, and in destitute circumstances. Malcolm called on her to assist in skinning the deer he had "found dead," and that night she had meat in the house sufficient for many days to come. Nice old man! Nice old lady, too; for next morning she went direct to the county seat where the grand jury was then in session and reported the killing for the sake of the informer's fee. At the trial Malcolm pleaded guilty. "Half the meat she had, and all the skin," said he to his Honor. "She was a widder an' starvin', an' I don't begrege her what she got. What's more, I'll be one of five men to give her a dollar a piece over an' above her share of my fine." I am glad to say that the judge assessed the lowest penalty admissible under the law, and that the judicial censure was directed, not at old Ganoway, but at the sole witness for the State.

From Ganoway, who stands first on the list, to Zeke, its latest addition, I have known market-gunners not a few, and have found each and every one thoroughly assured of the perfect legitimacy of his calling and content to continue in it. Making more than the barest living is quite outside his calculations, and, as opposed to the keen delights of the woods life, its exposure and hardships are as nothing. With different early training, he would have been the most ardent of sportsmen; but he was taught to combine business with pleasure, instead of earning a right to the last by close attention to the first. He is the living exemplification of a sad and serious mistake, and that is about the worst that can be said of him. And even this can be said of others, who never sold a squirrel or shot one, or even enjoyed the pleasure of seeing a streak of gray fur shoot up a tree and disappear in a hollow. So, if not deserving of unqualified blame, neither is the market-hunter an object of common pity, at least to a degree which should set him aside and apart from his fellow man.

S. D. BARNES.

ARKANSAS.

The Horse that was Locoed.

Editor Forest and Stream:

In your very complete account of our poison plants and weeds in the number for Oct. 1, is a mention of the loco weed. I have good cause to remember that weed; it gave me two of the most miserable days' travel that I have ever had.

The weed is quite common in some parts of what was the Indian Territory, Oklahoma now; but our cavalry horses did not seem to want to eat it. I had never seen an instance of their having done so until my horse made a supper of it, and came near killing himself. Had he not been a big, strong horse, he no doubt would have died then and there.

I had been sent with a dispatch up to Fort Supply from Fort Reno. Both posts are on the North Fork of the Canadian; Supply is at the head of it, where Wolf and Beaver creeks unite to form the North Fork. When going up I took the trail on the north bank of the river in order to hunt turkeys on my way up. There was a large roost of them, called Sheridan's Roost; the General had hunted them, and we gave his name to the roost. When ready to return from Supply, I took the trail on the south side of the river. I had left Supply at noon, and meant to get home the following day. I kept on until nearly dark, then camped just where night had found me, staking out my horse and lying down within reach of him. He had a habit of coming to where I lay and waking me up if anything happened in the night to alarm him. I needed no guard on when I had this horse with me. He never came near me this night, and when I got up next morning he was lying down; and on going to him I soon saw that there was something wrong with him; he got up when I told him to do so, then, after staggering around a while, fell down again. I examined the grass (it had been too dark when I came last night to do it), and found loco weed everywhere.

"I guess I have ridden you for the last time, Billy," I said, addressing the horse. "I can walk home now, then proceed to 'swear you off the papers'"—make an affidavit that the horse had died to avoid having to pay for him. I hated to lose the horse, I had ridden him three years; and as it afterward turned out I rode him the other two; but I did not expect to do it when I stood looking at him then. I got him on his feet again, and after giving him a good rubbing down with dried grass, took him down to water him. He drank a little, then I put him on fresh green grass here where there was no loco, and he tried to eat, but soon gave up and lay down again.

I had a small bag of salt in my saddle pocket, and gave him half of it. He licked it up, then, getting up, went at the grass as if he meant to live a while longer yet.

"I'll stay right here to-day," I said to myself, "and give you a rest." I had a dispatch to take down, but it could wait; it was not of much importance, or else it would have been sent by the telegraph line between the two posts. I started a fire and got breakfast, the

last I would get until I had reached home, unless I killed something.

I was nearly opposite to the turkey roost; so, leaving the horse, which was still trying to eat, I got across the river and shot a small hen turkey, killing her with a big .45 ball, that tore her up badly; but she would do for me to-day, I was not particular now.

The horse was still grazing when I came back, but looked very bad; in fact, he looked as if I had been riding him fifty miles a day for the last month. I stayed here all day, and late in the evening it began to snow, but the snow melted as fast as it fell; and it kept on snowing all night, while I stood over a fire drying one side of me while the other side was getting wet again. At daylight I got the saddle on and started walking and leading the horse.

The weather had got colder, and the snow, still falling, lay on the ground. It was the first week in November, and this was our first snowstorm.

After going twenty miles, I had to camp. Neither I nor the horse could go any further to-day; and I was still fifteen miles from the post.

When I started to make a fire I found my matches were all wet; the snow had got into the saddle pocket. Hunting up some dry cedar bark, I rubbed it until it was broken up; then wrapping it and a greasy rag that I used for a gun stopper, together, I scraped the snow carefully away from around an old dry log, and shoving the wad in under it, fired a shot from my pistol into it, and soon had a fire.

I had nothing to eat; there would be no chance to get anything here. It was too near the Indian camps to find any game; the Indians would not let game stay long enough for any one to find. After boiling a tin cup of coffee, the snow having stopped at last, I lay down in front of my fire and slept all night, not having had any sleep last night.

I started at daylight next morning, still leading the horse, and was home before noon. I put the horse in his stall, where he stayed for the next five months, looking at himself and doing nothing.

The dose of the loco he had got was a lucky dose for him; he was well of it in a fortnight, but he never had a saddle on him until I put it on about the first of the following April. A week after I had brought him home I was sent off again to go to the Antelope Hills and stay there all winter to watch Indians, who were out on their winter hunt. I had to ride a borrowed horse, one belonging to the saddler. His and mine were the only two sorrels in the troop, and I would not ride a horse of any other color. I might get shot off him if I did. I could not be hurt while on a sorrel. This is a fool notion, of course; but most of us have a fool notion of some kind or other. I have gone into places on a sorrel horse—and the sorrel and I have come out of them again, too—when I would not have gone within a mile of those places riding a horse of any other color.

My horse escaped work that winter because it was a rule in the troop that no man could ride another man's horse without the owner's consent, unless the owner was in the guard house—then he could.

I was not there all winter to give my consent, and was not in the guard house either, so Billy had a soft snap of it.

The most disappointed man at the post, when I brought that horse in was the captain. The horse was a thorn in his side, that he tried to get rid of, but never could. I once told him that I was willing he should transfer both me and the horse to another troop, but he would not let me go.

The horse was one of the meanest kickers I have ever seen. He would not kick at a man; but every horse or mule that came near him would get a kick, and often it would miss the horse and send the man to the hospital. The captain had been trying for several years to have the horse condemned, to get rid of him—he was really dangerous—but the inspecting officer would always be either Gen. Mackenzie or Col. Mizner, our senior major; they knew I did not want him condemned, and he was not condemned. He had to be kept in a stall by himself; he would kick a mule out of it if one were put in, and he always ate two rations—one that was given him and one that I stole for him.

I continued to ride him for two years after he had got the loco weed, then turned him in and left the troop. The next day the captain got rid of him; he turned him in to the quartermaster.

Two years after that I met him again. He was still in the service, though fourteen years old. He belonged now to the 10th Cavalry, colored; the colored man who rode him told me that he still kicked as badly as ever.

Although the horse had not seen me for two years, he still knew me; and taking him out of his stall I put him through a number of circus horse tricks I had taught him; he had not forgotten them either.

When I had told the captain of my fear of leaving the horse the morning I found he had eaten the loco, he said, "Oh, you need have no fear of that horse dying. There is not enough loco in the Territory to kill him. He is too mean to die; if he was not, you would not be so anxious to keep him."

CABIA BLANCO.

A Word to Cabia Blanco.

THE Hopewell Church, which I mentioned in my little paper of Sept. 17, is not the Hopewell Church in Allegheny county, to which you refer in your communication of the 8th inst.; but is in Indiana county, Pa., four or five miles north of Blairsville. It is rather an interesting coincidence that we should both have had some early associations of the ignis fatuus with Hopewell Church, and not the same Hopewell. Was pleased to see your article in the FOREST AND STREAM.

T. J. CHAPMAN.

INGRAM, Allegheny Co., Pa.

WHEN a Kansas City fire destroyed three buildings of the plant of the United Zinc and Chemical Company, at Argentine, Kan., thousands of fish in the Kaw River were killed by acids and chemicals that escaped from the plant into the stream.

Story of a Whale Hunter.

My hair is as white as the salt sea foam, and as I sit before the fire in the quiet evening hours, I often recall the wild adventures of my early manhood. They were upon the ocean, along the shores of various lands, and associated with the capture of the whale. Many of the books within my reach are full of interest, but I am not just now in a reading mood; and as my good wife is at this moment nodding over some of her fancy knitting, I will have a pen-and-ink talk with you, my friend, about the times of old.

Within the entire range of natural history there is nothing, in my opinion, which can give to the general student a more profound interest than the whale, and nothing in all the various pursuits of mankind possesses a more exciting and thrilling field of adventure than that of hunting the whale.

My experiences as a whaler have been chiefly as an officer, and I have both made and lost a good deal of money, sailing from New London and New Bedford.

I cannot here go deeply into the natural history of the whale family, but will give you their names and a few particulars. The sperm whales, which sometimes move in schools of two or three thousand, and at the rate of six miles per hour, are supplied with teeth, attain their full growth in twenty years, and often yield 150 barrels of oil, in addition to their sperm. Next in importance is the black or right whale, which has no teeth, but "carries a bone in his mouth" which all nations have admired and coveted. And then come the hump-back, fin-back, and sulphur bottom whales, which in different degrees are sought for by the men who go down to the sea in ships.

If we can believe anything that is asserted by the wise average man of science, the whale would never make a fish stew, as it is in reality a quadruped. It is a warm-blooded animal, and those appendages called fins or flippers are in reality its legs; its heart is like that of man and other mammals, having two cavities, and doing double duty in the line of circulating blood. It is not the offspring of an egg, but is born alive. What are generally called the blowholes of the whale are really nothing but its nostrils. The whalebone of commerce comes from the jaw of the animal, and is only found in the variety known as the Greenland or right whale. While the whalebone whale has no teeth, those of the sperm whale are carried in the lower jaw; and as to the size which these creatures attain, it may be stated that they have been known to measure 100 feet in length, and to have weighed nearly 250 tons. We often hear the remark that something we see "is very like a whale," and yet there are several animals to which we may truthfully apply that remark, viz., the dolphin, porpoise, the grampus, bottle-nose manatee, sea elephant and narwhal or sea unicorn. Nor will I stop to give all the particulars bearing upon the equipment of a whaling ship, but proceed at once with some of my adventures.

And first, in fancy, let us take a little run in the South Atlantic. We are in the vicinity of a great plain of sea weed, which is the favorite food of the right whale, and they are numerous in that vicinity. One of the crew has ascended to the "crow's nest," for you must understand that it is desirable to discover a whale, or a school of them, before we come near enough to see them from the deck.

The boats are ready, equipped with harpoons and lances and rope, the crews duly assigned, when lo! from the crow's nest comes the cry, "There she blows!" "Where away?" "Abeam, to the leeward, sir." "How far off?" "Two miles, sir." "Let us know when the ship heads for her." "Ay, ay, sir!" "Keep her off—hard up the helm!" "Hard up it is, sir." "Steady! S-t-e-a-d-y!" "There she blows! A large right whale with her calf, sir, heading right at us. Very large. There she blows! Now half a mile off and feeding, sir, and coming right toward us!" We lower away and are off. Now it is that you see the advantage of the drill we have practiced for many days. Every movement must be quick and sure, with no guessing or questioning what is best. There goes the great mother whale, followed by her offspring, both of them moving slowly and not heeding the coming danger. The boat has reached her side, a fearful flurry of excitement follows among the crew. One, two, and perhaps three lances are thrown, and away she goes, coloring the ocean with her blood, dragging the rope with fearful rapidity, then stops, goes into what we call a flurry, or her death agony, when she swims with her head out of water, making a circuit of miles, and lashing the sea into foam with her tail, and as she grows weaker and weaker, slackens her pace, straightens herself out upon the water on her side, and with her head invariably toward the east, dies. If the wind is blowing, the sea makes a clear breach over her as if she were a rock, and this has sometimes deceived the mariner. I remember one instance where a captain reported in New York the discovery of a rock in the track to Europe, and suggested that this had perhaps been the cause of many shipwrecks, when he had only been deceived by a dead whale. It has frequently happened in my experience that a whale after being harpooned has turned in anger upon his pursuers, and with his great flukes shattered their boat to pieces and killing many men; and I have also known a whale when angry to raise himself so far out of water as to look like a man on his feet, and then to let himself down with a crash upon the ill-fated boat. And then the speed with which the whale can move is a continual wonder with all those who have hunted them. The quickness and facility with which they can use their monstrous flukes is only equalled by the coachman's whip. It was never my fate to be seriously injured by an angry whale, but they have frequently suggested very decided thoughts of eternity. Once a fellow dragged me downward into the sea "full forty fathoms," judging by my feelings; and on another occasion I happened to be on the back of a big sperm whale when he made a start, and holding on to the harpoon, I traveled for a short time in a circle at the rate of thirty miles per hour, when I thought it expedient to slide into the sea and trust to being picked up by one of the boats forming the hunting party. And what will strike you as a fish story, but it is true, before I was rescued I actually went within an ace of swimming directly into the mouth of another whale which was strolling along the spot as if anxious to inquire about the general commotion going on.

The largest right whale I ever saw was captured off the coast of Kamschatka by one of my crews, and it was during the same year that I procured a full ship of 3,200 barrels of oil and 40,000 pounds of whalebone within the space of sixty days. When the monster just mentioned was killed, the sea was very rough. After the boats had been lowered, it was necessary to move them with great care, lest an unlucky wave should carry us on top of the whale, and this actually happened, for when I called upon the harpooner to fasten, he did so, when our boat was instantly thrown upward, and one man killed. Fortunately, before the boat filled, I had time to put a fatal lance into the whale, and we were rescued by another boat. As I was getting in, I saw near by the body of the killed man, in a standing position, a few feet below the surface of the water, when by diving I caught him by the ear, but a big wave came, causing me to lose my hold, and the body of our brave comrade went down out of sight in the blue waters. Into this whale we were obliged to send a succession of lances, and he spouted blood and disgorged food for six hours, having in that time lost what we estimated at a hundred barrels of blood alone. But I must tell you something more about this hero of Kamschatka. He was as long as our ship, and she measured 120 feet; his greatest girth 75 feet, head 30 feet long, and flukes 30 feet broad. His lips alone made thirty barrels of oil; throat and tongue the same amount, and the total yield of his blubber was 240 barrels. The bone taken from the inside of his mouth weighed 2,800 pounds, and his market value, according to the prices of oil and bone then ruling, \$18,600.

And now, without going into all the particulars as to how we hunters of the sea do our work when preparing our game for preservation, I will give you a few facts which have come to my personal knowledge, bearing upon the natural history of the whale. Here, for example, is a fact which I have not seen mentioned in any authentic books. On taking off the skin of a whale, you come to the blubber, which rests upon the flesh or muscle, and this I have found to be covered with a fine hair or fur, about an inch long; to this fur is attached a black pigment which answers the purpose and is used by the sailors as you would a common soap; but the significance of this fact is that in reality it makes the whale a fur-bearing animal.

And now about their numbers. I have sailed a thousand miles without seeing even the sign of a whale; and yet, in the North Pacific, I have on several occasions looked upon a thousand or more individuals of the sperm variety in one great school, covering the sea, apparently, to the horizon; and when tumbling and rolling and pitching and spouting, they have presented a scene of grandeur and confusion which no pen could possibly describe. In these schools there is always one fellow swimming in the center who seems to be the leader of the host, and he is called by the sailors the Old Soldier. And I may also here mention the curious fact that when you strike a whale with the lance, and he makes a demonstration with his tail, the entire herd go through precisely the same motion, as if influenced by a kind of magnetism. Nor should I omit an allusion to the almost human intelligence of the whale. I have known them to lie perfectly still long enough to let me get within reach of their flukes, and then suddenly turn upon the boat and crush it with their capacious jaws; and thus have I seen them watch for and destroy a number of boats and killing a number of men. All this is very unkind on the part of the kingly creatures of the ocean, but I have never been disposed to blame them for any of their savage eccentricities. Not only are they hunted and killed by the Yankee race, but they have a more terrible enemy that goes by the name of the killer. This creature is serpentine in appearance, armed with sharp teeth, and as the right whale often swims with his mouth open, the killer fastens himself on his tongue. When thus attacked, the whale is greatly alarmed and utters a bellowing sound which may be heard a distance of ten miles, meanwhile lashing the sea into foam with his flukes. After the killer has eaten away the tongue, then, as a matter of course, the whale dies from starvation. But again, to look upon a pair of whales when fighting with each other is a sight that can never be forgotten. I have seen an old fellow, after coming out of such a conflict, with his jaw bones bent all out of place, and with fearful gashes on his head and all along his body. When thus fighting—and the leaders of the various schools often come together—they either roar, which resembles distant thunder, and the spray which they often scatter into the air reminds one of the surf on a rocky shore. And then they are so ferocious. During the Rebellion it was my fortune to participate in two battles, but the terror I then experienced was not to be compared with that caused by a fight between angry whales in the North Pacific.

And here comes in an incident which happened to me at New Zealand a great many years ago. I had killed a whale, and having stripped off the blubber cast off the carcass. The wind and tide landed it high and dry on the shore. A few weeks afterwards, on visiting this spot, I found that a whole family of natives had eaten their way into the carcass and turned it into a habitation; and this was anything but a "sweet home," and its influence—such as it was—permeated the whole country for miles around.

And now, my good friend, I will continue my yarns, which I tell you are all true, with a brief dash at the sea-serpent. I am a believer in the veritable existence of such a creature. I once saw a specimen in the South Atlantic Ocean, near the Ascension Islands. He was at least sixty feet long, and I followed him with a bold crew for at least two miles, but he gave us the slip, and went down into the world unknown. And I have talked with many whalers in different parts of the world who substantiated my belief.

In 1847, while working away from Cape Horn against a head wind, I ran my vessel into a bay and found safe anchorage. After night had settled upon us, I discovered a light not far from shore, and was greatly bothered to know what it meant. When morning came I made an exploration, and found a trio of shipwrecked sailors in a kind of camp. They were in a terrible plight, almost without clothing, and greatly emaciated by hunger. Here they had been for nine months, and one of them was so weak that he could not stand. Seven men had deserted from the ship *Elinor* of Mystic and four of them had died and were still unburied. Their tale of suffering was

most deplorable, but I took these survivors on board my ship and succeeded in bringing them alive and well to New Bedford. Many years afterwards, while sitting in a friend's office in New York, I suddenly heard my name called by a person present, who rushed up and threw his arms around my neck. He was a very large and rough looking fellow, and these were his words:

"Sure's I'm a living man, this is the captain who saved my life at Cape Horn! Don't you know me, captain—the boy Jim whom you saved? I swow! You haven't changed a darn bit since I last saw you. Come, I am a farmer now, over in the 'Jarsies,' and you must go over and let my wife see the man who saved Jim's life. Come and spend the whole summer with me."

And then followed a long talk, and I felt very certain that my old shipmate, like all good sailors, had a very grateful heart. But I did not go to the "Jarsies," although it would have been pleasant to have had a talk with Jim's wife.

And now, with one yarn more, I will conclude this letter. My vessel was a clipper, barque-rigged, a particular pet, and she always "carried an ivory bone in her mouth," as we say of a fast sailer. It was in the Southern Ocean, and we were cutting in a small whale, when early one morning we saw an English transport bearing down upon us. The captain spoke us, and asked if some of his passengers might come aboard and see the process of cutting in. I consented, and among those who visited us was a young lady, accompanied by her brother. I did all the honors as well as I could, and gave them a good dinner. The lady was greatly pleased, and told her brother she did not wish to return to the transport, but would like to remain on the beautiful American vessel. But this could not be, and when the time came for parting, I noticed a squall coming up from the offing, which induced me to take the visitors to their vessel in my own boat. After a hard pull of two hours, for the transport had drifted a great distance, I placed the party on board, and then the lady asked permission to give my crew a drink of brandy all round. I consented with reluctance, and was foolish enough to participate in the treat; and when it was ended, and we were bidding adieu, I accidentally backed off the gangway and fell into the sea, between the ship and our boat. I went down about thirty feet, and when I came up found myself astern of the ship, about twenty rods off. Although the water was rough, I had strength to keep on the top, and it was not long before a life-boat reached me, and I was saved, but entirely helpless from exhaustion. And then it was that I heard of the fearful screams which my lady friend had uttered when she thought herself the cause of my death, and also that it was by her own hands that the life-boat had been lowered which saved me from drowning. When, after many hours, I had reached my own vessel again, and reflected on all that had happened, I solemnly resolved that I would never again touch one particle of any kind of intoxicating drink, and I have never broken my vow down to the present day. Had I been drowned, the owner of the vessel would have lost heavily, and as all I then possessed was invested in that ship, my widow would have been penniless. But by the special mercy of the Creator, my life was saved; not only that, but after a cruise of fifteen months, circumnavigating the globe, I returned home with a full ship, and having thus acquired a little fortune, I concluded to coil up my ropes and anchor on shore for the balance of my days.

L.

Minnesota Forest Ways.

Editor *Forest and Stream*.

In your issue of September 17, C. P. Ambler says he cannot agree with me in my idea of irrigation by a system of reservoirs made by means of road grading. Yet there is no doubt but that water could be impounded by a road grade. Water held on an elevation is convenient for irrigation. Water held back in freshet times lessens the flood volume. That is all there is to the scientific part of the subject. Mr. Ambler's objections to my plan are all pretty fairly answered in article two of "Rebuild the Earth," printed in the same number of *FOREST AND STREAM* that contained the objections. Mr. Ambler proposes to substitute forest reserves for my plan. That is simply dropping the main part of the plan. You cannot reforest a desert without water. Neither has the natural forest proved adequate to the task of preventing flood and drouth.

It is only a few years since the first timber was cut in the Rocky Mountains, yet the rainless deserts have existed for many centuries. The only forests I know of that are nurtured by abundant moisture—those of the mountains—are nurtured by the deep snows of winter which melt and water the soil in summer, and by precipitation caused by the cooling process when moisture-laden air crosses the mountain tops. In the north they are nurtured by countless lakes or natural reservoirs, and by streams. True forests are nature's reservoirs, and should be preserved and added to. But before forests can be builded in the waste places there must be water. There must be a beginning before there can be fulfillment. Hence we talk of things we know we shall never live to see.

The forests will never be preserved to any great extent as long as political parties can use them to pay political debts with. Neither is it wise to preserve forests in their entirety. Such timber as is fit for lumber should be cut and used. The villainy is in cutting what is handiest and leaving the waste to burn and destroy the rest.

Here in the country from which I now write (the lake lands of northern Minnesota) is another argument against the reservoir system. In most places where nature has constructed reservoirs in the form of lakes, the Government has supplemented the work by building dams across their outlets, thus increasing capacity. Ostensibly this was done to maintain an even flow of the streams, preventing floods and assisting navigation; in reality to assist the lumbermen in stripping the earth of its timber supply. In the fall the dams are closed and the water is allowed to accumulate during the winter. When the lakes are frozen the lumbermen haul the logs out upon the ice or bank them along the stream. In the spring, when there is a natural freshet, the dams are raised that logs may be floated out of the lake and down stream to market. This surplus, added to the natural freshet, causes

great floods, and settlers along the streams have raised a great outcry against the dams. But the settlers are weak, the lumbermen strong, and any one can guess who has the best of that argument.

More than half of the men who have been elected to high office in Minnesota have grown rich out of timber lands. In this list I hear mentioned United States Senators, Governors, members of Congress, and State legislators. Add to these innumerable county officials and the capital necessary to work their plans, and you begin to gain some idea of the power behind the throne of timber destruction. As before said, the evil is not so much in the cutting of available timber as in the terrible litter left behind. To clear up this litter would cost money, and no matter how many millions a corporation may have got for nothing, they are not willing to pay one cent toward mitigating the evil they have done.

In olden times the outlaws of Robin Hood type were pictured as giving something back—a stage fare, a meat ticket, or some trifle. But these have no heart, no soul, only cold and senseless greed. One of the main evils of this wholesale slaughter of the innocents is the great numbers of workmen brought into the country to do the necessary work. These in time settle all through the woods, far from any base of supplies, where they can only struggle and die or turn timber thief or "Winchester farmer." I was told when I came here that I could not make a living unless I joined the timber brigade; but my natural abhorrence for a thief is too great to be overcome, and I shall join the "Winchester farmers" as far the nobler class.

Large lumber companies own most of the land and hold it at impossible figures. This causes the settlements to scatter through all the woods in place of working out solidly from a base of supplies and building good roads as they go. These scattered settlers encounter untold hardships which would make the world stare if it could only see.

This county of Aitkin has immense natural wealth, but is hard to develop and utilize. Not the least of the obstacles in the way of progress is the land companies, which are but the aftermath of the lumbering operations. One of the main plans by which money is made out of office is in the timber estimates on public lands. Men are sent out to estimate the amount of timber on given sections of school and Government lands. The officials see that the right men are sent, and they get the correct estimate for private use, while another far below the real value is given the public. This eliminates the trouble of some competition in the bidding; thus the Government sells the land for a song and then turns the crank of the phonograph and sings the song itself, besides helping the lumber companies to float out their boodle.

Grover Cleveland dug out a nest of this class of estimators and appointed a new lot. I got acquainted with this new crowd, who at the time were drawing \$6 per day and keeping open club at a hotel many miles from the land they were supposed to be estimating. However, I could tell them all they need to know of the land over our cinch games, as I had camped and traveled over it several seasons, and there was not a stick of marketable timber on it. We had jolly times over the cinch games, though, for they were indeed a pleasant set of gentlemen to associate with. Oh, man of boasted honor, thy name is surely Treachery and Deceit.

E. P. JACQUES.

The Adirondack Forests.

Editor *Forest and Stream*:

In your editorial note of October 15, on the protection of the Adirondacks and Mr. Suter's report on forest fires, you say: "The serious aspect of the subject which makes worth while this distribution of the report of the Association, is that under like conditions of a protracted drouth, the State would now be no better fitted to cope with Adirondack forest fires than it was in 1903. New York suffered loss then; but it has not profited by the lesson. The Legislature of last winter was not equal to the demand upon it to provide for a competent study of Adirondack conditions, which might furnish a basis for an adequate scheme of fire protection. The Legislature, for session after session, is content to intrust its forestry affairs to junketing commissions who are not fitted by technical education and training to investigate the Adirondacks intelligently and to report upon them in a way to merit public confidence. So long as the penny wise and pound foolish policy of Governor Odell shall prevail, with respect to the forests of the North Woods, we may not look for any radical betterment."

No more inaccurate or misleading or disappointing paragraph could be written by the leading forest and game publication of this State. I have been for six years chairman of the Senate Forest, Fish and Game Committee, and up to the close of the last Legislature my committee had made no trip, whether junketing or otherwise, except to spend two days in New York city last January listening to suggestions of members of the Association for the Protection of the Adirondacks and others interested, with a view to improving forest conditions. As a result of that trip and much other work both in and out of the session of the Legislature, the committee submitted a report known as the report of the special committee on the future policy of the State in relation to the Adirondacks and forest preservation, in which they recommended:

"First—The passage of an act definitely fixing the limits of the Adirondack Park so as to include the contiguous forests which the park was established to protect.

"Second—A resumption of the State policy of purchase of lands in the Forest Preserve.

"Third—The enactment of laws requiring adequate precautions against fire setting by steam engines, a stricter accountability in damage of all parties setting fires carelessly or wantonly, and the establishment of a system of fire patrol.

"Fourth—The adoption and execution of a plan of reforestation of denuded State lands in the Forest Park.

"Fifth—A constitutional amendment empowering the Legislature to pass laws for the destruction or removal of dead timber and debris on burned areas through agencies and employees of the State, and not by contract, for the purpose of, reforestation; and for the sale of lands owned by the State in forest preserve counties outside the park limits when unsuited for a forest preserve, and the ap-

plication of the proceeds to the purchase of lands in the park.

"Sixth—The passage of an act defining the boundaries of the Catskill Park."

All of these recommendations were adopted by the Legislature without exception. Two hundred and fifty thousand dollars were appropriated for the purchase of lands. The appropriations for the forest department were unusually heavy, including a large number of items, and because Commissioner Middleton and Col. Fox, Superintendent of Forests, believed that in view of the unusually large appropriations for the department, the appropriation of \$10,000 to be used in connection with the National Government, could safely be postponed until another year, Governor Odell struck the item out, that being, I believe, the only item in the department that was stricken out.

A system of fire patrol was established by statute under language elastic enough to enable the commission in case of necessity to patrol every township in the Adirondacks and Catskills. Additional powers were also given to local fire wardens, placing fire patrol and compensation therefor upon the same basis as compensation for putting out fires. It was believed that prevention of fires was more important than extinguishing them after they had started. Radical provisions were adopted in sections 228 and 230 of the Forest, Fish and Game Law against railroads setting fires, and the rule of damages heretofore existing changed so that the railroads should be liable for State lands burned, although such State lands did not join the railroad lands. Five permanent assistant fire wardens were added to the force, whose duty it is to serve along the line of steam railroads in the forest preserve inspecting the engines and reporting to the commission, and also serve as game protectors. Power was also given to the Commissioner in case of an emergency to convert all the forest, fish and game protectors into fire wardens, and to set them to patrolling the forests. If approved of by the Governor, any number of men can be employed temporarily for such purpose. Many other provisions of the law were changed and strengthened, and it was at the time declared by all forest experts consulted to be the best fire protection law in the United States. Compliments to the committee were received from the Association for the Protection of the Adirondacks, from Mr. Suter, and, if I recollect correctly, in your own journal. I do not hesitate to say, after making a careful study of the subject during my seven years in the Senate, that the law is now entirely adequate for the prevention of fires, and a failure to prevent fires will raise a strong presumption of incompetency of administration. Everybody knows that there may be exceptional conditions which no one can overcome, but even then the damage can be minimized.

I have no defense to make of junketing trips made for the gratification of junketers, and not for the public benefit, but if you will look over the two reports I send you, one the report above referred to, and the other the report of the special committee of the Assembly on the Adirondacks, of which Thomas M. Costello was chairman, submitted April 13, 1904, and then say that the recent work of the legislative committees in relation to the forests does not meet your approval, I shall be even more astonished than by your latest editorial remarks.

I know it is the fashion to take a fling at Governor Odell, and perhaps I ought not to have expected any more discrimination upon your part in that respect than in the political newspaper. The list of measures outlined in the above report, all of which were adopted, would seem to be sufficient refutation of such a charge for the last session of the Legislature. If not, you can add the act for the protection of black bear, increasing the compensation of game protectors from \$500 to \$600, stopping spring shooting for shore birds, the sale of trout in certain counties, etc., while not a single act in violation of game protection detrimental to the forests was passed. Taking up now the session of 1903, we find the law extending the power of search for fish and game possessed unlawfully to the counties of New York and Kings, prohibiting the sale of grouse and woodcock killed within this State, prohibiting the killing of water fowl in the spring, and many less important, but wholly desirable, acts.

The years 1901 and 1902 have equally valuable legislation. It was in the first year of Governor Odell's administration that the forest commission was made a single-headed commission, one of the greatest reforms of recent years in that department, and one which I hope may never be disturbed. I have no hesitation in saying that there has been as great an advance in forest preservation and game protection during the administration of Governor Odell as during the administration of any Governor of this State. In some respects it is distinctly superior to all others. This is no small praise when we recall the administrations of Governor Roosevelt and Governor Black. In the Washington review of game legislation throughout the country, published in the Evening Post under date of September 1, occurred these statements: "The four most important measures, viewing the subject in its national aspect, since no State works for itself alone in these matters, are the new game laws for Louisiana, the new game laws in Kentucky, the search law and the shortening of the season on shore birds in Massachusetts, and the group of acts which have been passed in New York. The most important of these New York laws stops spring shooting of shore birds, extending to them the protection which the year before had been gained after a long struggle for the duck. Another provides for a Catskill park along the lines of the Adirondack Park. * * * New York seems to have done the most in its Legislature of any State during the last winter. There have been a number of minor changes, nearly all in the direction of greater protection, such as shortening the season for shooting birds, and extending the close season on deer in certain counties. Besides the Catskill Park, a bill was passed last winter at Albany defining the boundaries of the Adirondack Park, another extending the protection upon Mongolian and English pheasants until 1910. New legislation provides for restocking the Adirondacks with elk and also with beaver. Black bear are to have a close season during July, August and September, which they have not before had. New York also sets a good example to other States in printing for widespread distribution copies of her fish and game laws, so that people may know the legal requirements with exactness," and much more of the same.

I am aware of the criticism because Governor Odell

refused to approve appropriations for the acquisition of more lands during the first three years of his administration. His opinion as to the wisdom of this course differed from mine, but his action was unquestionably dictated by considerations not in the least unfriendly to the Adirondacks. He was seeking to abolish direct taxation, and believed that good business sense required more caution on the part of the State in its efforts to acquire these lands. It would be about as reasonable to treat Governor Odell as an enemy of the Adirondacks because he differed from the Association for the Protection of the Adirondacks, or with me, on the wisdom of suspending purchase of lands, as it was for the Abolitionists to denounce Abraham Lincoln for his attitude toward the negro race.

Forestry and game journals throughout the country have very generally recognized the supremacy of New York in her last year's legislation for the protection of both forests and game. I think, in view of these facts, it is incumbent upon you to revise your editorial criticism.

ELON R. BROWN.

[It is obvious that our remarks on the Adirondack forestry situation neglected to make necessary note of the good work of Senator Brown's committee and the legislative action on it. Our reference to Governor Odell's forestry record was in no sense political. The incident affords a striking commentary on the way in which the public's forest interests and the personal interests of politicians have been so intimately associated in this State that one may not question the course of the executive respecting forestry without somebody promptly raising the cry, as Senator Brown does here, that it is a political "fling."]

Snipe Shooting by Fire Light.

AFTER the disappointment of the day, I had pretty much determined to give up my pursuit of the elusive snipe, for this year at least, give the good old gun a thorough overhauling and cleaning and put it away for its well-earned summer rest.

I had covered what seemed to me miles on miles of soggy, sloppy country, sinking to the knee first with one leg, then with the other, and at one time taking a sudden and ignominious seat flat in the oozy marsh.

To be sure, just at the close of the day, when I had given up all hope of having so much as one shot, and as I was nearing the sheltering clump of trees where I had left my horse and rig, I did happen on a pair of snipe that seemed, temporarily at least, to have given up their all-absorbing search for food, and bidden good-night to the rapidly departing sun. The surprise of meeting was mutual, and one of the pair paid the price of its unwatchfulness with its life. A signal miss was the result of my second barrel, but I promptly attributed this to the failing daylight. "Yes, of course, this was the cause of my missing." How one does love to discover a good excuse for a bad shot.

Weariness was my portion on reaching home; but a good, hot dinner, together with dry clothing, a soothing pipe in front of the blazing log fire, put me in a little better heart. A second pipe (a rare indulgence for me) seemed to give me added content, and as I sat with that lazy, dead-tired comfortableness—the kind that only comes after good, hard, and healthy exercise, with the fire throwing out its cheerful warmth and east-jug flickering shadows into the far corners of the room, I thought, "Now, why should I not try snipe just once more? There's Smith's marsh and Robbin's Run; I haven't been to either for more than three weeks; sure to hold a few to-morrow. Why not try it, then call snipe off for the season, and turn my attention to more profitable, if less pleasant occupation? Yes, I would go again to-morrow."

It did seem that morning came very soon. I was so tired, too; but the day was good; it had turned a little cooler, and a light breeze blowing from the north seemed to give the atmosphere a clearness that it had lacked on the previous day. Breakfast was over in a jiffy, and it took but a moment to "hook up." Calling Bess, my retriever, we were off, jogging along for Robbin's Run. I would take that in first, and then swing around through the Barrens, and down on to Smith's marsh.

Scarcely had I come through the fringe of alders, bordering the marsh, when scape-scape! up he jumps, and scape, another just behind him. The light was evidently just right this time, for Bess is bringing in the first, and I hustle after the other myself, for time is precious and I cannot wait for her to retrieve it. Is not this my last day?

A shot further up the marsh puts me in a bad humor. "Some one else working down this way; putting everything up, and—great Scott!—here come seven or eight snipe right at me. Steady, slow, now; don't brown them. The last two seem to edge this—bang! and they are past like a streak, and I get the last two with one barrel; didn't mean to, though. Two more shots up the run do not so much as ruffle me this time; they may produce the same result as before. But no. This is my turn to do some "putting up," for Bess jumps a single bird and he is "gathered in" unresistingly (sight seems to be fine to-day). And then a strange thing happens. Down the marsh, directly at me they come. First three, then a single. This time it looks like five or six. There is an intermittent popping in front of me, but strangely indistinct—perhaps owing to my own fusillade. The other shooting appears like an accompaniment in a minor key.

I am continually starting snipe, or having them sent down to me by my fellow sportsman at the other end. And, though usually I am not at all sure on snipe, I am certainly "on" them to-day; must have twenty or more by this time, and they are constantly dropping to the Greener's bark. Bess is working like an automaton, too. Everything is satisfactory, except—How cold it is; I am almost shivering. I er-er-sneeze! And then—Ah, me! yes. I might have known it. Cold? No wonder. Fire out, hearth cold, and there I sit with the indistinct reports of guns still sounding in my ears, and a vivid picture is before me of English snipe skimming past me, only to double up as if by magic at the gun's word of command; but there are real snipe days still to come to me, I hope, and—it was a bully dream, just the same.

R. H. C.

NATURAL HISTORY

Commentaries in Camp.

WHERE THE TROUT BITE, Maine, Sept. 29.—*Editor Forest and Stream:* I have just had two heavenly days in the woods and on the lake, and am therefore trying to be thankful instead of grumbling because one of my two remaining days for trouting is one of pouring rain.

I sit in my little cabin alone and read *FOREST AND STREAM* of September 17 and September 24, and venture to send you a few notes and queries suggested by them.

The discussion about the *ignis fatuus* interests me. Once when a small boy I thought I saw some dancing, flickering lights above a meadow and stream as I was riding past at distance of perhaps an eighth of a mile. I wanted to see just that phenomena. I had read about it, and had long had a hope, not unmingled with a little creepy dread, that I might be permitted to see it. As I think of it soberly now I would not make oath that I actually did see the will o' the wisp of my dreams. Certain I am that if I did see it, then it was my only sight of it, though I have always been on the look out for it. I have come to believe that it is one of those things which, as Emerson says, are

"Seldom seen by wishful eyes."

This doesn't mean that I am altogether skeptical of their sometime real occurrence. But I do wonder if it is seen half as often as reported.

Mr. Chapman's clear recollection and circumstantial account of the one he saw, leaves only one thing to be desired, viz., a rational theory of its possibility. If the *ignis fatuus* be, according to theory, only a puff of gas igniting by spontaneous combustion, it is difficult to understand how it could go sailing away from its source and maintain itself in combustion, to say nothing of it being, as Mr. Chapman says, "not bright and shining like a flame, but a round well-defined ball of light," "white but not bright," and of feeble illuminating power. Such a thing as phosphorescent gas might possibly account for such an appearance. Is there such a thing? But even then how can we account for its retaining its globular form and not spreading and dissolving in the air as an ordinary puff of gas or cigar smoke would do?

It reminds one of the "balls of fire" of which we every now and then hear which are said to enter rooms and circle about in a marvelous way; sometimes exploding with great noise, and said to be examples of the "globular form of lightning," whatever that may be.

I once proved that a series of bubbles coming up from the mud of a Maine pond were of an inflammable gas, for I caught a lot of them in an inverted and water-filled bottle, and on releasing the gas upon a lighted match it burned with a quick flash. Let us have more accounts and as definite and circumstantial as Mr. Chapman's, of the *ignis fatuus*, and we shall begin to know more about it perhaps.

Mr. A. D. McCandless's "Boyhood Days in Illinois" was a delight to me, and all because of my own memory of very similar boyhood days in that State. His descriptions of the marvelous flight of blackbirds, pigeons, and prairie chickens are true to the life—but, alas! the life now gone forever. I am glad he has raised again the question of the sudden disappearance, about 1865, of the countless myriads of pigeons which we saw in their spring flight. I have raised this question several times in these columns, and have contributed my conjecture as to the cause of this sudden disappearance of the pigeon. As Mr. McCandless pertinently says, "Had they dwindled down in numbers year by year, and finally ceased to come altogether, I could understand that man, in his destructiveness, had caused their extinction, but as they stopped coming all at once, I have been at a loss to account for it. Did they take some other route, or were they exterminated by some disease, or other catastrophe?" In my humble judgment that last phrase, "other catastrophe," and that alone, explains it. I believe the great body of the passenger pigeons perished in a cyclone while migrating across the Gulf of Mexico. I have seen a definite, and I believe still verifiable, statement that once after such a cyclone the waters of the Gulf were covered for leagues on leagues with dead pigeons. Let someone prove that the passenger pigeon never migrated beyond the limits of the United States, and I must admit my theory untenable. Does anyone know anything whatever as to the former winter habitat of the pigeon?

To support the theory of destruction by catastrophe—and particularly by just that kind of catastrophe—I have cited the circumstantial account, printed in a Canadian paper last year, of an enormous mortality of pigeons once caused by a storm while a great flight of them was crossing Lake Michigan. The writer of the account affirmed that after the storm the lake shore (above Milwaukee, I think), was covered with dead pigeons which he said were washed up in "windrows." I reassert that the problem of the disappearance of the pigeon is one of great interest, and should receive attention before the event passes from the memory of living men.

The squirrel barking question in its ups and downs has interested me. I am on the side of Audubon and the "barkers." Though I never barked a squirrel, I know a veracious man who tells me he has several times done it. He is one of *FOREST AND STREAM*'s most accomplished writers and trustworthy observers of nature, and I sincerely hope he will contribute to its columns the interesting chapter which I know he can write if he will. I differ from Mr. Allen Kelly on this point, though agreeing with him emphatically as to "The Improved Wilderness," and must think that the "myth busters" have the poor end of the case. It reminds me of Mr. Brown's attempt to make a "myth" of Kipling's "shod canoe-pole." I am reminded of this afresh by having just read in an interesting article entitled "A Trip to Ripogenus," in the September number of *The Maine Sportsman*, the following: "The shod canoe-pole is the warmest friend the riverman has to lean

on during the times when he must run the rips of the Penobscot, and were it not for the iron point his hold must often have slipped, and, if not causing an upset, at least made his work doubly arduous, for it is no trick for a tenderfoot to handle a canoe in such quick water with a powerful gale swinging his craft just where it should be steady, and making the work of managing it as hard as the most expert care to tackle."

It isn't negative, but positive testimony that counts. Another instance of this is furnished by Mr. Brown in his disquisition on "Sleeping Wild Ducks Awakened by Telepathy." Simply on negative evidence, Mr. Brown makes the sweeping and absolutely universal statement, "No man ever saw two or more dusky mallards (*Anas*

THE LOCKED ANTLERS.
With portraits of Mr. Laight and Jacobstaff.

obscura) that were all actually sleeping together." Now, unless the thing is contrary to the laws of matter and motion, and unless Mr. Brown is the only man who ever observed dusky mallards, his expression "No man ever" is illegitimate.

I do not know that all the members of a group of dusky mallards ever did actually sleep at the same moment. Possibly such a thing never did occur; but certainly it is not within the province of a single observer to affirm it, despite his boasted twenty years of observance and in the dozen places he cites. In his criticism of Mr. Burroughs, he queries how any man could "know" that ducks riding on river ice were "actually asleep," and even "sleeping soundly." The question is a pertinent one. How, indeed! But if Mr. Brown will but sneeze, he will find that his own head has been cut off by the same sharp blade; for he had in only the previous paragraph affirmed as posi-

THE ANTLERS FROM ANOTHER ANGLE.

tively true of all men in all time what he could not possibly have known to be absolutely true of every one of even his own observations.

Brethren, let us have less dogmatism about these questions which interest us and much more of careful observation and particularly of careful testimony.

Two more articles in your issue of September 24 especially interest me. The first is the one by Charles Cristadoro on "Cyclones." The doings of the cyclonic wind are so various and curious that the verifiable accounts of them would constitute a chapter of marvels. I hope other readers of *FOREST AND STREAM* will follow Mr. Cristadoro's example, and relate what they have seen of the work of cyclones. I can add my own chapter upon occasion, but will not so prolong the present letter. If anyone is inclined to doubt any feature of Mr. Cristadoro's account, it must be one who has never seen the effects of a real cyclone.

The other thing I wanted to mention was U. S. Commissioner Skinner's mention of "hummingbirds" in the list of birds of Abyssinia in the article entitled "Abyssinian Game." Must not Mr. Skinner have in mind some other bird than the genuine hummingbird, which I have always understood was found nowhere in the world but on the American continent?

C. H. AMES.

Locked Antlers.

Editor Forest and Stream:

With this we send you views of an interesting and unique specimen of locked horns in a fight with bucks. The two bucks were found by a hunter and guide, Mr. Brown, in the Province of Ontario, about forty miles from Peterborough, in October, 1902. Hunter Brown sent the heads to Mr. Robert Marron, taxidermist, who mounted them in September, 1903. Mr. Marron is one of the best artistic taxidermists, and not second in his work to others, as a visit to his rooms in Palisade avenue, Jersey City Heights, will give ample testimony. Mr. Marron had several offers for the heads from European collectors and sportsmen from abroad, but for patriotic reasons he preferred to have them remain in America, and they were recently secured by Mr. Wm. K. Laight, one of our enterprising citizens. Mr. Laight does not claim to be a sportsman, as the saying goes, but is a genial, whole-souled gentleman of wealth and leisure, and a great traveler, having been around the world more than once. He has filled his luxurious house on Pavonia avenue with choice collections of antiques, paintings, Japanese ware, pottery, and exquisite specimens of woodwork. He is an enthusiastic collector. But in our opinion (as a sportsman, of course), the locked horns are not the least among his treasures.

The larger buck was of six prongs, the lesser of four prongs, seven years and five years. One of the prongs of the larger deer had entered the side of the head and penetrated the brain of the other deer; this is the deer with the tongue protruding, and it must have been dead some 72 hours before discovered by Mr. Brown. The larger deer was still alive, though exhausted from starvation and the strain of dragging around its dead adversary. The ground for many yards was torn up, large saplings broken down and smashed into splinters in the struggle of the monarchs. We regret that, owing to the way of mounting, we could not get a photo showing the contact of the prong in the brain of the vanquished.

The views were taken at our request by Mr. Edward Ingram, an amateur photographer, an all-round sportsman, a good shot, and great judge and lover of horses and dogs.

JACOBSTAFF.

The Corbin Herd of Buffaloes.

Editor Forest and Stream:

As I sit here in my home in the mountains of New Hampshire, I see through my study windows, to the east, the wondrous blue hills of the Croydon Range, stretching away to the north and south as far as the eye can reach. Along the nearer slopes there are great belts of hardwood trees, clothed in all the beauty of New England autumn foliage—in raiment of crimson, of purple and of gold. Running through them in places there are strips of dark evergreen forest, mostly spruce and pine and hemlock, which extend upward and cover all the peaks and ridges. And above all there is a sky of heavenly blue, across which is sailing a fleet of white and fleecy clouds. This side of the mountain slopes, and extending to the very border of my garden, there are great stretches of rolling land, almost bare of trees, covered with grass which at this season is light brown in color, and divided by living, leaping trout brooks, whose liquid music comes to me through the open window of my study. This is the view I have of The Blue Mountain Forest, known to many as Corbin Park, the largest and finest fenced game preserve in America.

In this vast inclosure of 24,000 acres there are hundreds of deer and elk and moose, and there are wild boars, too, by hundreds, but what is of far more importance to the people of this country, is the fact that in this great park is preserved the largest herd of pure-bred buffaloes to be found in any inclosure in the world. This fact is of special interest at this time, when our Government and the intelligent people all over the country are being urged to take the last chance to save from total extinction one of the grandest, if not the very grandest, hoofed animal which ever trod the earth. That the millions of buffaloes which darkened the plains of the West less than thirty-five years ago were shamelessly butchered to swell the purses of a few unscrupulous men, is one of the darkest blots on the history of our country, and it has disgraced us in the eyes of the other civilized nations of the world. For years it was supposed that the buffalo was gone, and in truth there seemed to be no possibility of his survival, and that we now have one more chance to save this splendid creature from total extinction is due entirely to the efforts of a handful of able and public-spirited men like the late Mr. Austin Corbin, the founder of The Blue Mountain Forest Game Preserve.

People are so used to thinking of the buffalo as belonging peculiarly to the West, and the owners of Corbin Park are so modest concerning their own achievements, that comparatively few people even know of the existence of this great herd. Of course the United States Government and all authorities on the buffalo know all about it, but within the last week I have read one magazine article and one newspaper article concerning the last surviving buffaloes, and in neither was there even the briefest mention of the Corbin herd.

In the year 1890, the late Mr. Austin Corbin, who had just fenced his large game park near Newport, New Hampshire, established there a herd of about thirty buffalo of the finest stock, with a view to preserving some of the last survivors of a fast-vanishing race from total extinction. They were taken off the cars at Newport and driven between five and six miles along the country roads to the park, to the great astonishment of many of the farmers, who had never seen buffaloes before, and who mistook these huge shaggy beasts for some new breed of cattle which Mr. Corbin had imported.

The little herd was allowed to roam at will over Croydon Mountain and the plains which surround it for seven months of the year, and during those seven months the animals got their own living, and were no care to anyone. But the winters in New Hampshire being long and severe, it was necessary to feed them on hay during the five remaining months, and as a matter of convenience they were yarded during these months in smaller inclosures, near the barns where the hay was stored. All went well with them until 1896, when the herd had increased to seventy-five head, and it was decided to ship twenty-five head to Van Cortlandt Park, New York. Owing to bad management these twenty-five became so diseased that they either died or had to be shot. This constituted the most severe setback which the herd has ever sustained. The fifty which were left in New Hampshire continued to thrive, and in 1900 it again numbered seventy-five, and from that time until the present day there has been a steady increase, and now the herd numbers over one hundred and sixty as healthy and as handsome buffalo as ever graced a western prairie or gladdened the eye of a hungry Indian. Even as I write, I see from my window this splendid herd grazing on a hillside not far away, their dark brown bodies in strong relief against the light brown grass. For a month or more they have been wandering on the other side of the mountain, but now they are back again, and we shall enjoy the sight of them perhaps for days to come. Something has startled them, for they have stopped grazing and have raised their heads in alarm. And here they come down the mountain side like a charge of cavalry, their tails in the air, and their humps rising and falling as the animals move on with their peculiar bounding movement, which carries them easily forward at a speed with which we should hardly credit such ponderous animals. They come like a landslide, the earth trembles beneath their mighty hoofs, and the sound of their coming is like the roar of an avalanche. As they near the level ground below they gradually slacken their speed, the roar of their hoof-beats moderates and dies away, as the buffaloes finally come to a halt on a grassy plain which borders my garden. And for the hundredth time I must go out to admire anew these picturesque creatures which form the most interesting link we have connecting the twentieth century with the early history of our country—with the history of the Indians and the pioneer settlers. There are many calves scarcely six months old, with innocent faces and absurd little horns, which must cause their mothers some discomfort, for these husky babies are as yet unweaned. Then there are handsome young spike bulls and heifers, and scores of other buffaloes of all ages, up to those grand old

patriarchs with deeply-curved horns and long black beards, whose shaggy heads, if mounted (which heaven forbid), might be worth anything from \$500 up. For a moment I forget that I am gazing on almost one-fourth of all the living buffalo, and in imagination I ride with Colonel Dodge for fifty miles across the plains through a single herd which numbered three million head. And I stand with Catlin in an Indian village and watch the braves don their masks, each made from the skin of a buffalo's head with the horns upon it, and see them join in the "buffalo dance," that weird ceremony performed in order "to make the buffalo come." And I see the naked Indian hunters, astride the bare backs of their ponies, riding after the shaggy monsters of the plains, shooting them down with bows and arrows. I see, too, a herd of buffaloes standing in the snow, watching with disdain the approach of a big gray wolf. And I see what the buffaloes do not see—the sinewy hand of an Indian creep out from the shoulder of the wolf, and a long arrow, which soon whistles to its mark, and causes the biggest bull in the herd to sink upon his knees. Then there is a change of scene, and I see the white butchers come, and by a series of brutal massacres never equalled by the people of any nation which pretends to be civilized, wipe the buffaloes from the earth, while America stands by with folded arms and watches the practical extermination of one of the grandest animals of all time. For a moment my heart sinks, but as I come back to the present, and looking up see the vigorous creatures before me, a new hope is born, for here is proof that the buffalo may yet be saved, if the American people will but stretch forth a hand to save him.

Given one condition—a considerable area of land over which to roam—buffaloes are not difficult animals to keep. They are quite as easy to rear, and less expensive to feed, than domestic cattle, and in the hands of men wealthy enough to stand the initial expense, buffalo farms could be made profitable in almost any of the States north of those which border on the Gulf. In the first instance, the United States Government should be most strongly urged to establish several small herds in different parts of the country, so as to avoid all possible chance of a large number being wiped out at one time by contagious disease. One such herd has already been established in an inclosure in the Yellowstone National Park under the management of Mr. C. J. ("Buffalo") Jones, and this has doubled in numbers in a remarkably short time. If from four to six other herds of say fifty animals each were bought and maintained in the same way, the future of the buffalo would be assured, the day would soon return when a buffalo robe could be bought for less than a

hundred and fifty dollars, and the American people would have freed themselves from the charge of having allowed their grandest-looking and most valuable native animal to become extinct.

ERNEST HAROLD BAYNES.

Prairie Dogs and Rattlesnakes.

WYMORE, Nebraska, Oct. 11.—*Editor Forest and Stream:* While in Cherry county this month I killed some rattlesnakes, and skinned them, and I send you three skins by express to-day. Two of the specimens are of the black mountain rattlesnake, and the other is the ordinary prairie rattlesnake.

I killed a large number of these snakes, and in one I found a prairie dog nearly full grown.

The old story of the snakes, dogs and owls living in harmony in one hole is not true. When a snake takes possession of a dog hole, the dog leaves it, and generally fills up the hole, pounding the ground down as hard as possible, and then digs a new hole for himself. This is why you always see so many new holes, and so many abandoned ones in a dog town. Mr. Stilson and his son Will told me that they one day counted thirty of the little dogs fighting a rattlesnake, and that they killed it.

These snakes leave the dog town in the spring and scatter over the country, returning about October 1 to 15, and on warm days they lie in the sun around the holes. That they eat the dogs there is no doubt. This time of year there are many dogs not more than half-grown, and some that can hardly be told from old ones.

I do not know whether the owls ever go into the holes or not, but they stay around the towns in great numbers. If Brother Kelly organizes a society of "myth busters," I think I shall apply for membership.

A. D. McCANDLESS.

Large-Eared Bat.

BALD KNOB, N. M.—*Editor Forest and Stream:* I wish your Natural History editor would identify species to which inclosed scalp belongs. I have examined lots of bats of the ordinary mouse-eared type, but this is the first of its sort, and suggests that its grandsire a thousand times removed might have sheltered under the eaves of Balaam's barn; also that the original Pegasus might have been such another, only larger. Is there a distinct species of bats with jack-rabbit ears, or is this critter a freak?

S. D. BARNES.

[The ear measures an inch from base to tip. The specimen is evidently a large-eared bat (*Pleocolus macrotis*), a species found in the southern and western portions of the United States.

GAME BAG AND GUN

An Indian Hunting Camp.

ST. LOUIS, Mo.—In rummaging through my library I recently came across an old volume of "Missionary Life Among the Indians," written by Rev. James B. Finley. His vivid portrayal of an Indian hunter's camp proved very interesting to me, and no doubt will to many of your readers.

The scene of the camp was somewhere about twenty-five miles south of Upper Sandusky, O., and the period, 1882.

ABERDEEN.

An Indian Hunter's Camp.

In February nearly all of the Indians went to the woods to trap and make sugar. They seldom return from these expeditions till the first of April. I sent with them an appointment to meet them at Between the Logs' Camp, on their hunting ground, and hold a two days' meeting. About the first of March I left upper Sandusky in company with brother Armstrong, as interpreter, and brother Mononcue, to attend this meeting. The morning was cold, and our course lay through a deep forest. We rode hard, hoping to make the camps before night; but such were the obstructions we met with, from ice and swamps, that it was late when we arrived. Weary with travel of twenty-five miles or more through the woods, without a path or a blazed tree to guide us—and withal, the day was cloudy—we were glad to find a camp to rest in. We were joyfully received by our friends, and the women and children came running to welcome us to their society and fires. The men had not all returned from hunting, though it was late. But it was not long after we were seated by the fire, till I heard the well-known voice of Between-the-Logs. I went out of the camp and helped down with two fine deer. Soon we had placed before us a kettle filled with fat raccoons, boiled whole, after the Indian style, and a pan of good sugar molasses. These we asked our heavenly Father to bless, and then each carved for himself with a large butcher knife. I took the hindquarter of a raccoon, and holding it by the foot dipped the other end in the molasses, and eat it off with my teeth. Thus I continued dipping and eating till I had pretty well finished the fourth part of a large coon. By this time my appetite began to fail me, and I was for leaving off; but my comrades said, "This is a fine fare, do not quit yet." So I took a little more, and thought it was a good meal without bread, hominy or salt.

Their winter hunting camps are much more comfortable, and the scenery more pleasant than those who have never seen them would imagine. They are built of poles, closely laid together, by cutting a notch in the upper part of the pole, and so laying the next one into it, and then stopping all the cracks with moss from the old logs. They are covered with bark, a hole being left in the middle of the roof for the smoke to go out at. The fire is in the center, and the beds are round

three sides. These are raised from the earth by laying short chunks of wood on the ground and covering them with bark laid lengthwise. On the bark is spread skins of some kind, and these are covered with blankets. The beds are three feet wide, and serve also for seats. These camps are always pitched in rich bottoms, where the pasture is fine for horses and water convenient. Around them you will often find a flock of domestic fowls, which are taken on horses from the towns for the purpose of getting their eggs and to secure them from the dogs, which generally swarm around an Indian camp. The Indian women make baskets of bark, and drive down stakes into the ground on which they hang their baskets. Perhaps there will be half a dozen on one stake, one above another; and from them they gather large quantities of eggs.

The troughs in which they catch their sugar-water are made of bark, and hold about two gallons. They have a large trough made like a bark canoe, into which they gather from the small ones. The women make the sugar and stretch all the skins. The men trap and hunt.

One man will have, perhaps, 300 raccoon traps, scattered over a country ten miles in extent. These traps are deadfalls, made of saplings, and set over a log, which lies across some branch or creek, or that is by the edge of some pond or marshy place. In the months of February and March the raccoons travel much, and frequent the ponds for the purpose of catching frogs. When the raccoon has taken a frog, he does not eat it immediately, but will carry it to some clean water and wash it; then lay it down on the leaves and roll it hither and thither with his forefeet till it is entirely dead and then he feasts on his prey.

The hunter generally gets round all his traps twice a week, and hunts from one to the other. I have known a hunter to take from his traps thirty raccoons in two days, and sometimes they take more. From three to six hundred is counted a good hunt for one spring, beside the deer, turkeys and bears.

The bears at this time of the year are generally taken from the hollow trees or rocks, where they have lain for a month or two. During the winter these animals sleep with little intermission for three months, and receive no nourishment, except what they suck out of their paws. I have taken them out of their holes when there has been from one to two gallons of clear oil in the intestines and nothing else that could be perceived by the naked eye. In hunting bears at this season, the Indians search for them in the hollow trees and rocks. When they find a tree that looks likely to lodge a bear, they examine the bark to see if one has gone up. If there are fresh signs and the scratches are not long, but just sunk in, this is a good sign. But if there are long marks made with the hindfeet, it is supposed that he has been up and come down again. And if the thing is doubtful, they cut a brush, and with it scrape the tree on the side opposite the hole and cry like a young bear; and if there be one inside, he will either come

and look out or make a noise so as to be heard. If it is ascertained there is one inside, then, in order to get him out, one climbs up a tree that is convenient, or, if there is not such a one, they cut one so as to lodge it near the hole. Then he fastens a bunch of rotten wood to the end of a pole, sets it on fire and slips it off the end of his pole into the hollow of the tree, where it soon sets fire to the rotten wood. At first, the bear begins to snuff and growl and strike with his forefeet, as if he would put it out. But the fire, steady in its progress, soon routs him, and he comes out in great wrath. By this time the Indian is down, and has taken the most advantageous position with his rifle, and when the bear is fairly out, he fires at him. If he does not succeed at the first shot, his comrade fires, while he reloads, and so they keep up the fire till Bruin yields up his life.

These animals seldom have more than two young ones at a time. The cubs are small at first, without hair, blind and exceedingly ugly. The dam is very careful of them, and will fight desperately to protect them, and is very dangerous when the cubs are either taken or wounded. Young bears are easily tamed, but they are very troublesome, and of no profit. Their flesh is most delicious, and is found to be very healthful and easy of digestion. The oil of a bear, fattened on beech nuts, is the most diffusive and penetrating of all oils. The Indians eat it till their skins become as greasy as if it had been rubbed on externally. It is preserved for summer use by frying it out and putting it into cured deer skin, with the hair grained off when the skin is green. Deer meat is sliced thin and dried over the fire, till it can be easily pounded in a mortar. This mixed with sugar and dipped in bear's oil is the greatest luxury of an Indian table. This, with corn parched in a kettle and pounded to meal, then sifted through a bark sieve and mixed with sugar, makes the traveling provision of an Indian in time of war.

Non-Residents and New Jersey Mud Hens.

THERE appears to be some uncertainty as to the privileges of the unlicensed non-resident gunner in New Jersey. The law provides that non-residents must take out a license (fee \$10 and 50 cents to county clerk) for shooting game, provided "that this act shall not apply to hunting or gunning on game preserves at present established, or to gunning and hunting for wild water fowl, snipe or mud hens." The "mud hen" in New Jersey game law nomenclature is also called "marsh hen." From this, then, it is clear that the unlicensed non-resident may shoot only "wild water fowl, snipe and mud hen (marsh hen);" and of course may shoot these only in season.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

A Winter Vacation.

It had not occurred to me, nor have events fully proven, that it was the entangling theories or ideas regarding field companions that caused a gentleman who for many years has been a devoted hunter and angler to begin early last year to send to his suburban home barrels of clay targets, some hand traps and shells, and was seen from time to time carrying from the city various bores and weights of shotguns. These circumstances indicated that he was simply furthering for himself a higher idealism of the fitness of things pertaining to outdoor life. In other words, with a forethought that is second in nature to genuine sportsmen, he was six months in advance preparing for a winter's vacation.

To some men a winter's vacation afield is an easy matter; they just pack up and go. To others it may be different, even difficult. Some homes seem to be deprived of the principal reason of their existence when the master is afield, and in many cases that same master sacrifices his better self to lonesome hours at home, while he indulges himself in hours equally barren while away. Those hours, perhaps, that are spent in his pursuit of game, may be excepted.

A great many homes are conducted by a combination of tastes that eventually find, or should find, one channel of thought. This sort of a combination of interests generally insures success in life's best endeavors, and solves, for those so fortunately situated, the problem of field companions as well as chums at home.

Pursuant to this thought, I recall meeting a beautifully gowned woman one afternoon while I was exercising a fine pair of young setters, and witnessing her terror lest one or both of them should touch her gown. Her husband was a sportsman. I had shot with him, and he owned a pair of dogs quite equal to my own. In our conversation she informed me that "she thought her husband had a pair of dogs of some kind, but she didn't even know their names." Dogs didn't separate that man and wife, but they are living apart. Meanwhile my dogs showed great judgment and dropped at a safe distance. Brute instinct sometimes approaches very close to psychological reasoning.

But to return to affairs in our lives that are more pleasant to dwell upon. I was glad, indeed, to accept an invitation to visit my friend in the country one afternoon early in the fall, and was greatly interested when with him Madame appeared in boots and short skirt, and with a 20-bore shotgun in her hand. A short walk from their home brought us to a pretty clearing in the woods. Here he arranged his hand target trap and began throwing targets, while Madame did the shooting. Well, it did that man more good to see her break a flying target than it would to win a silver cup for himself at a State shoot.

Upon our return to the house for dinner, Madame went to the kennel and let loose a beautiful pair of setters, and pointing with much pride to the whiter one of the two, said with much feeling: "She, the white one, is mine—all mine. Isn't she a beauty? The trainer says she is a very promising one."

I quite agreed with the trainer, for inside of three minutes the white one arrived home with one of a neighbor's chickens which, when dressed, weighed 4½ pounds.

Two months later, the owner of that chicken and his entire family dined on quail killed over that white pup. It is quite unnecessary to state that, inside of a week after the chicken episode, the trainer was sent for, and the white pup went to school.

I think it was December 9, last year, that I met my friends in Jersey City and bade them adieu; not, however, until I had visited their section in the sleeping car and ascertained that their destination was Barnwell county, S. C. Madame was very enthusiastic, indeed, explaining the absence of the dogs by saying they were still with the trainer near Reidsville; that the train would reach there at six in the morning; that Mr. Lewis would be there to meet the train and put Peggy and Nancy on the same train with them. The seat in the sleeper which faces the rear end of the train I noticed contained much hand luggage; as a matter of fact, I counted three very smart looking gun cases among other things, and I asked Madame about them. "Why, you see," replied she, "that short one contains my field gun, just a dear little 6-pound affair that will not tire me. The black case contains my husband's field gun, six and a half pounds in weight, 12-bore, 28-inch barrels and 14-inch drop of stock." At this remark, my friend looked at me and winked, and was caught in the act. Madame's color rose nicely with the occasion, as she continued. "The other case contains his duck gun; its dimensions are the same as the field gun, but it's much heavier."

As I passed from the car, I heard Madame saying: "Well, I don't care; length and drop of stock are confusing, and you hadn't any business winking. He would never have noticed the difference." In this she was wrong; and yet who couldn't and who wouldn't forgive and forget an error that was so helplessly overwhelmed by such high and lofty enthusiasm.

After leaving Washington some time after nine o'clock the same night, a new conductor appeared, and then it appears that some confusion occurred. My friends had transportation reading through to Barnwell county, S. C., but they wanted, above all things, to be called at 5:30 in the morning, a half hour before reaching Reidsville. "Well," declared the conductor, "I'll mark your tickets off at Reidsville." "But," replied the gentleman, with some warmth, "we don't want to get off at Reidsville. We want to go straight through to Barnwell county, S. C." "Well," said the conductor—but here Madame interposed by saying: "You see, Mr. Conductor, our trainer is to meet this train at Reidsville and put our dogs on there, and I am so anxious to see whether Peggy will know me or not. Do you think she will?" With the remark, "She ought to, Madame—I'll send the porter to you," he disappeared down the aisle.

It was about the middle of a beautiful afternoon the next day that a heavy train pulled into a small town in Barnwell county, S. C., and came to a stop. The engine driver leaned far out of his cab window and remarked to his fireman that "this stop won't save any coal." Yet as he continued to look back and counted two dog crates, two trunks, two sole leather cases, three gun cases, some

hand-bags, a sprightly little woman, a proud looking man, and heard the "All aboard!" from the conductor, he further remarked: "Say, Tom, I guess this train will move easier and quieter, too, from now on."

Peggy and her mistress had met, and Peggy was proclaiming her joy as only a joyful pup can.

It has never occurred to me that one could judge of the number of inhabitants a town contained by the number of people at the station when a big train pulls in; but I have often thought that one can gather somewhat of an idea of the town's industries by these semi-daily events, and this is particularly true of some of the towns in the South. Judging from the attention shown my friends on their arrival on this occasion, the principal industries must have had their limitations, with a slight suspicion that even the post-office was closed.

As the train went puffing over a slight rise on its mission south, there appeared from behind the little station a tobacco wagon, to which was hitched a diminutive pair of tan-colored mules, while from a safer distance down the road a real smart looking but ill-matched pair of horses came pulling a canopy-top surrey. Now it appears that this was my friends' first visit to this section of the country, and they patiently stood by the noisy crates waiting for someone to claim them. The claim was soon made by the two drivers of these two teams by their salutation of, "Here I is, boss," one of them going so far as to offer as evidence of his good faith a note written by the "Major" regretting his inability to be present at the station to greet them, but assuring them of the cordial welcome that would be extended them at the plantation by him and his good wife. It occurs to me to say here that different occasions nearly always produce different effects on the same people. And this, it seems to me, in a way or to a limited degree really explodes the theory that the people of the South do things slowly; that in some instances they lack push—are not quick and alert; situations are seen, but not grasped. Never was a tobacco wagon loaded with keener interest or more timely alacrity than that one was. Even Peggy became quiet in the whirl of excitement. Everybody helped, and all helped at once, at the two sides of the surrey. Willing and "wide open" hands tucked in the robes. Even the nuts to the axles were examined, lest disaster should occur. Undoubtedly trade looked up in that town that night.

Two small mules of uncertain age hitched to a tobacco wagon were never known to make good time, owing partly, perhaps, to the fact that there is so little road down hill in the country where they are used; consequently the surrey drawn by the Major's best team reached the plantation long ahead of the less prized, but equally valuable mule team. Under ordinary circumstances it would seem needless to mention this fact, but in this instance there was so much genuine unhappiness manifest that is of interest, that to tell of this winter vacation and omit this instance, one of the morals of this outing is lost. Madame was behind the horses, while Peggy was back of the mules. Madame's husband became convinced long before Duncannon plantation was reached that he was the most thoughtless and cruel man in the world, and secretly wished in his heart that Peggy had never been born.

The gloom that sometimes enters the soul under the pressure of events for which we are in no way responsible, however, is like the chill of a room—soon dispelled by a light wood fire and the cheerful greetings of friends. The welcome at Duncannon plantation was of the old style—warm, cordial, and hearty—and for the time being mule locomotion was lost sight of. There is, however, something exhilarating—if a mule can exhilarate—about a mule pointed toward home, and a winter sunset. In time, and nearly together, the sun went down and the mules arrived. So did Peggy, also Nancy—dear, patient Nancy—dear, patient Master.

I have already referred to my friend as an old sportsman. Earlier experience had taught him that a newly broken pup is something like a college graduate—they both have plenty of learning, but both are in the primer class of experience. With this in mind, he suggested to his field companion the advisability of going out the first morning with the Major alone and try the dogs. Nancy he was sure of, but Peggy was in a way an unknown quantity, except in a vocal way. To this Madame heartily agreed, she being, it is presumed, no great exception to women as a rule, who like to get their trunks unpacked and "put to rights" before visiting can really commence.

As the Major and his guest turned into a lane bordered on each side by water oaks, and the horses struck into a gallop, Nancy and Peggy, with heads and tails well up, bounded away across an adjoining field, while Madame stood on the wide porch in front of the house waving an adieu. It is quite needless to relate many, if indeed any, of the experiences of these two gentlemen afield on this day, it being but a side show to the main circus. It is sufficient to relate that Nancy hunted her ground over in splendid style, avoiding the pup by her long, graceful sweeps of outlying territory, while Peggy covered and recovered the inner circle. Both found birds, and both pointed well. Peggy backed handsomely, while Nancy showed a very marked disrespect for her younger companion by refusing to believe her at all. This fault, however, was soon overcome, and when night came this delighted hunter believed they had the best pair of dogs in the world, and said so.

In a world that is so full of interesting incidents as the world is in which we live, memory, like a broncho, at times becomes freakish, so that days and mile-posts alike are at times lost. However, with my friends at Duncannon plantation, it was like elsewhere among well regulated people. Near the end of the week when they got there, and outside of the one day mentioned, I do not know what occurred until Monday morning came, when it seems that a long and sweetly cherished theory that had been born long before, attempted to walk.

When Madame appeared in front of the house on this memorable morning (memorable at least at Duncannon plantation) in smart looking hunting boots, short covert-cloth skirt, red cardigan jacket, and khaki hat jauntily tilted well back on her head, and a small shotgun under her arm, the husband looked happy, and no doubt felt much like the proud father who sits in his easy chair and watches baby make his first journey afoot from a near-by

chair to his trembling knees, full of hope, overwhelmed with pride, but just a bit anxious.

Down through the lane of water oaks they passed, on across the watermelon barren to the woods beyond, Nancy—dear, patient Nancy—close at heel, Peggy—frolicsome, happy Peggy—making the sand burrs fly, returning now and again to greet her mistress with loud and thrilling yelps.

During the tramp across a long patch of country where no quail would likely stop, a dog argument occurred as to the relative merits of Nancy and Peggy, and Peggy won, yet it produced a dogged silence on the part of Nancy's master, which, however, did not last very long on account of the near approach to a more promising zone of bird territory, where the word was quickly given to Nancy to "Get away!" while another sentence was added for Madame's benefit, "There goes my argument."

It was fully an hour and a half later before those speedy and seemingly tireless dogs found a covey of birds, and then in an unfortunate position for Madame. They lay in a patch of thick scrub-oaks near a road through this former woods. Nancy was pointing while Peggy was backing. Madame was told to load her gun and walk quietly ahead about thirty yards, while our theoretical friend back-tracked to a safe distance, then took to the brush to get around the birds and drive them her way. This he succeeded in doing, but only secured one long-range shot for himself—missing, of course. Through the scrub he broke, and came out into the road by Madame's side, red in the face and full of excitement, exclaiming, "Why didn't you shoot?" To which she replied, "Why, they went by me so fast I simply couldn't."

"Well, did you mark them down?"

"What do you mean?"

"Why, note the course they took."

"Course they took? Why, they just went everywhere. Some, however, went over that hill."

So toward that hill our friends traveled, he breaking the way, she following at heel. Just over the rise, Nancy swung in front of them, going at fine speed, stopped suddenly and crouched, indicating a close bird. Madame was brought up in position, her gun cleared for action, when a quail arose within ten feet of her gun barrels, and made straight away from her. "Shoot!" yelled her companion, and getting no response, he butted in and killed the bird. As the bird fell, he looked at her in blank amazement, while she looked at him with as sweet a smile as the sight of heaven can produce, and said: "My dear, that was beautifully done. I am so proud of you. I am sure most men would have missed that bird. I wouldn't have missed seeing you make that shot for the world. And Nancy—wasn't she glorious? But where is Peggy?"

Sure enough, where was Peggy? Twenty yards further ahead was Peggy, pointing another bird, while Nancy was backing with a dead bird in her mouth.

Again was Madame forced to the front. Away went another bird. Still a silent battery was manned by Madame. Again the sharp crack of her husband's gun. Another bird falls, another retrieve is made, and then that heavenly smile is born again; and once again by that praise is the gathering storm averted; again they push on. If cyclones of great force and of widespread destructiveness could thus be sidetracked, Kansas would be a lovely State to reside in.

Three more points and backs, two more kills at long range and a miss at still longer range, marked the hour of noon. With a three hundred acre watermelon patch to cross lengthwise in order to eat, the baby had taken three steps and fallen down five times.

That midday march under a southern sun that creates such peculiar shadows excites the admiration one moment and produces sympathy the next. This man of theory was seen trudging along with a shotgun under each arm, and a very tired little woman with a firm grasp on his shoulder marching alongside of him. At Madame's side, with distended tongue and drooping tail, walked Peggy. By her master's side came patient Nancy—dear, patient, silent Nancy. Not a word was spoken, not a sound heard, except the panting of the dogs and the occasional crush of a dried watermelon rind as a heavy boot plunged through its tender sides.

When despair gets the saddle well strapped astride of hope and begins its ride to destruction in the mortal soul of man, he should avoid the photographer. He isn't apt to make a pretty picture; likewise his presence is likely to chill warm soup and spoil a good dinner. He had best take to the woods and pull himself together; and this is what my friend did on the afternoon of that memorable day, while Madame and Peggy rested.

It is a most difficult thing for us to realize just how other persons feel when their lofty ambitions come to nought, because we cannot put ourselves in their places; nor at the stage of collapse assume our brothers' burdens. It is a fair venture, however, to assume that my friend, when he departed alone from the house at noon, suspected how the man felt who built the first flying machine when he struck the earth.

It is, however, only the gloom of ended years that can dampen to the extent of moulding the spirits of some men, and many happy days were spent at Duncannon plantation. A buckboard was brought into service, and a small horse called Buckskin was daily hitched to it, and a small negro by the name of Alexander was secured as a driver, and with this rig Madame spent many days afield, made many pots of coffee, and shared her hunter-husband's luck by a camp-fire, dividing always with Peggy and Nancy, too, while the husband coached both dogs to a higher state of perfection in their field work, even to the extent of having them take turns retrieving. Their winter vacation was a success, but on the lid of the chest that holds the sacred records of those days afield can be read: "Bird shooting; except in rare cases, is not a woman's game," to which are affixed two signatures.

T. E. BATTEN.

Quail Take to Trees.

A NORTH CAROLINA correspondent writes: I notice in my hunting trips for five or six years past that partridges are getting more and more in the habit, when flushed, of taking to trees. I find this is the case to a considerable extent in Virginia also. Farmers tell me it is because the birds have learned more sense. That is their way of putting it.

FRED A. OLDS.

Days with the Wildfowl.—III.

NOTWITHSTANDING the lugubrious soughing of the wind around the ragged corners of the old sod lodge, and the extreme volubility of the coyotes all through the night presaged a new brand of weather for us in the morning, it did not come, and for once all signs failed. Instead of rain or cold the morning broke beautifully with a clear summer sky and a caressing breeze from the south. Somewhat fatigued by my previous day's experience with Babe on the Bull Camp Lake, I was inclined to linger in bed this morning, but along about 8 o'clock Gerard burst enthusiastically into the room with an exclamation that the biggest flight of birds that had yet passed over was in progress, and I got up, hurriedly slipped into my duds, and joined him outdoors.

The first thing I observed when I emerged through the low doorway was dotted lines, V-shaped columns, and massed bunches of birds streaking the whole heavens from the rim of the low sandhills to the southwest to the taller range rearing itself like a gray wall athwart the northwest, between Hackberry and Watt's Lake. There were thousands of them, canvasback, redhead, mallard, widgeon, pintail, spoonbill, and teal; and they trooped across the blue canopy for fully three-quarters of an hour, all going in the same direction, and finally disappearing at the same point over the distant hills.

Inspired by the spectacle, Gerard and I were not long in determining what to do. We would go over to Willow Lake, the direction whence the flight had come, and in the tall reeds and willows which bordered it, await their return. I felt that the birds would be straggling back in this direction all through the day, and urging Gerard to get ready, I went into the lodge, refilled my shell case, pulled on my waders, and as Gerard arrayed himself according to my directions, I discussed the proposed excursion, in order that the little fellow might know what to expect.

In the first place, the rest of the hunters, including even old Bill and Jim, the chef, had hiked off to the different grounds before I was up, and there being no rig available, we had to walk to Willow Lake, which lay off to the southeast, probably a mile beyond Clear Lake. We were then, after we got there, to hunt on a different plan than we had yet tried. Hitherto we had done much of our shooting from a boat, in which we had plenty of room for all sorts of traps, but on the present occasion we had to dispense with every pound of superfluous weight, for we would be compelled to do all our work from the shore on foot, with a prospect of plenty of wading and walking. Consequently we made our arrangements accordingly.

For the benefit of young duck hunters, I will add, as many of them probably already know, that inconspicuous clothing in shooting wildfowl from a boat, even, is very necessary, but in shooting from the shore, in the sparse covering of cane and reeds, your raiment must conform as closely as possible with your environments, for standing in shallow water you will have no chance to lie down on the approach of a flock of birds, as you would have in a boat. You have simply got to squat as low as possible and take your chances. A dead grass colored corduroy cap, shooting coat, and Banigan waders, and you are all right. For the trip I deftly fashioned a coat for Gerard out of an old gunny sack, cutting armholes in the same, and slipping it over his sweater, and he was rigged up about as appropriately as I was myself, although his hip boots were black rubber instead of canvas, like my own. In duck shooting, hip boots are a *sine qua non*, whether boating or wading. And it is always better to have a good wide brim to your hat or cap, for it comes in handy when shooting against the sun, and acts as a shield to the face in wind and rain. Don't fail to see that you have your jack-knife and plenty of good stout twine in your pocket, for they will both come in nicely oftener than you would imagine.

"What are we going to do for decoys?" inquired Gerard, as the sheen of Dewey Lake burst upon us as we climbed the last roll in the prairie and began our descent toward the low-lying shores.

"We will not need decoys," I replied, "as we simply wade along the shores and jump what laggards there may yet be feeding in the rice. However, I think the Judge and Thomas were over here yesterday, and I think I heard them say they left their decoys on the water where they had been shooting; a bad plan, however. Decoys should never be left out over night at a point where you intend to shoot the next day or any time in the near future. The birds get familiar with them, and after a time steer as clear from them as they would a man standing gun in hand in plain view. If the Judge and Charlie did leave their decoys, though, we may stumble on them, and if we do, we will abandon pedestrianism, make a blind, and take it easy. But look at that flock of gulls; they have been feeding on the minnows and mollusks along the shallows there. Shall I kill one?"

As I put the interrogatory, at least two or three hundred of these graceful black-backed, creamy bellied waifs of the air arose from the nearest shore line, and sounding in dissonant chorus their weak little squeak, they began to knit a network of soft plumage in the sunlit air, and as one, with more temerity than wisdom, came dipping down over us, I inquired of the boy whether I should kill him or not, and getting a half reluctant affirmative reply, I cut the beautiful creature out of the air, and it came fluttering down, almost at our feet.

Gerard picked the bird up daintily by the tip of one wing, and as he whirled it around the scarlet splotch dyeing its velvet-covered chest caught his pitying eye, and reproachfully he said: "Oh, Pop, what did you kill it for? Poor thing, it could not hurt anything."

"But you told me to, son; and then, while I condemn the needless destruction of bird life in anyone, I wanted you to see this bird, and examine it, as living you would have no chance to. It is a good lesson in ornithology, and under the circumstances will make a lasting impression."

"I thought gulls only lived on the ocean and along the coast," continued Gerard, folding the bird's wings closely against its sides, and wiping the blood from off its pearly breast with the tail of his gunny sack wammus.

"No, they do not. While they are naturally an ocean bird, they do not confine themselves to its vicinity, but frequent all larger bodies of fresh water, often far inland,

and ascend all our rivers many hundreds of miles from their mouths."

"There must be many kinds of them, for when out in Portland last summer we used to see a half dozen different species, all of them larger than this one."

"Oh, yes, there are fully forty species of gulls, and the most of them are to be found in this country. The bird you have in your hands is a lesser tern, one of the smallest of all the family. Many of the big salt-water gulls are not as harmless as this little fellow, but prey fiercely on other birds."

"These terns or sea-swallows are much smaller than the birds you saw on the Pacific Coast, and are much more graceful in form and movement. It is doubtful whether you will ever see more beautiful exhibitions of the flight of birds than those being given by those terns out over the lake there. Like the larger birds, they are cosmopolitan. Some species are very abundant, others are extremely rare. In this country there are at least twenty well defined species. Many of them breed right here on the open ground among grass tufts, or in some dry nook on the lower slopes of the hills. No regular nest is made. The young are brown colored. The old birds make a good deal of noise when their young are molested, but make no attempt to protect them. Look, there is a flock of mallards coming back. See them settling there at this end of Willow Lake? Come on, let's mosey. We are apt to get some fine shooting during the next hour or so."

Twenty minutes later we stood on the last slight elevation overlooking Willow Lake, and after surveying the charming outlook for a few moments started on down to the shore and began our tramp around the lake.

We had not gone 100 yards when, with much quacking, an old hen mallard leaped from amid the smartweed and flags, and undertook to curve around over the lake, but leading her a foot or two, I knocked her down nicely, and Gerard started right out after her.

"Hold on, there, Babe," I continued, "if you don't want to get in over your waders, go around to the right there and follow the open water."

"But it isn't as deep here in the tules, is it?"

"Yes, deeper. You see those fallen rushes out there in front of you?"

"Yes."

"Well, when you see them lying like that, you can depend upon it that they are full of trouble for the inexperienced hunter. Those rushes always flourish on a soft, mucky bottom, and you would certainly get your boots full if you tried to wade through them. But over there, where you see those straight, arrowy fellows, you will have no trouble in getting along. They always indicate a substantial bottom, and if you work along them, you'll not get wet, and nothing is so annoying as to get your rubber boots filled with water. You see, Gerard, I want you to carefully note these little details, for you will not have your old Pop always along with you, and they will help you out of many a difficulty in the future."

The boy then followed my directions, reached the dead duck with ease, and picking her up brought her in to the shore, and we started on round the lake.

A quarter of a mile further down the shore, in rounding a big curve where the rushes grew luxuriantly, we suddenly came on to a bunch of decoys dancing merrily on the little waves in a little bay, out sixty or seventy yards from the sloping bank, and wading out we came to a nice round nest in the tules from which the owner had been shooting.

"The Judge's decoys," I remarked, after a searching glance at the bevy of counterfeit birds on the water, "and from the empty shells scattered about here, he and Charlie must have had lots of fun last evening. Down!"

From out on the lake, coming straight toward us, was a line of birds. At first, from their size, I thought they were mallards, but there was too much white on them, and I concluded they must be canvasbacks. In another second or two they were almost upon us, and catching a good view of their long, sharp bills and bulky green heads, I knew at once what they were.

"Mergansers," I whispered. Then as they swished down over the decoys and up into the air, like the runner of an old-fashioned sleigh, I jumped to my feet, and leading the head bird, I killed the third one back of him, and with the second barrel dropped one of the tailenders.

I noticed that both birds—the mergansers—had fallen into the water where it was a trifle too deep for Gerard's waders, and cautioning him to remain where he was, I went out and retrieved them myself. They were a male and female, the former an old bird and in the fullest flush of his autumn plumage, with his head as bright green as the purest emerald, the splotches on his wings as glossy and black as silk velvet, and his body as white as the driven snow.

"Isn't he a beauty?" I remarked to the boy, as I stepped inside the blind and handed the drake over for his inspection.

"Yes, indeed, he is, and what a pity it is to kill them," replied Gerard, as he smoothed out its ruffled feathers. "Are they good to eat?"

"No, not very. They are what we call 'fish ducks,' and take no more rank as a table bird than a mud hen."

"Then why did you shoot them?"

"Well, to tell the truth, they fooled me until it was too late. When I first drew up on them I thought they were canvasbacks, and when I did recognize what they were, I was already pressing the trigger. However, they will furnish you with another lesson in nature, and the drake we will try and preserve, and when we get home I'll have it mounted. They are a very interesting species of water fowl, and there are a half dozen varieties of them. These are the great American mergansers, the largest of their tribe. Generally they are called 'saw-bills' out this way, but in the East they are 'sheldrakes,' 'spirit,' or 'fish ducks.'"

"Are they plentiful here?"

"Quite. The hooded variety, a smaller bird, about the size of a bluebill, being the most plentiful. They are drab in general color, with a chestnut crest on their heads extending down over the back of their necks. They are seen in greater numbers in the spring, and on the breaking up of the Platte are to be encountered numerous along that stream, even the great American variety. They come in flocks of from ten to twenty, and even double this number, especially this species. The hooded variety are more solitary, and do their traveling mostly in pairs. These big fellows have a steady but rapid flight, pursuing

their way along the shores two or three deep. I have noticed the flocks along the Platte in the early spring seem to be made up almost wholly of males, the females following later in large flocks. See that hawk? Keep perfectly still; I think he will come over us."

And sure enough he did, a big redtail, and as he dipped down close over our heads, we caught the flash of his wild eyeball and the orange of his slender legs as he swept by. He did not discover us, and I allowed him to continue in quest of his noonday meal unmolested.

"But the mergansers, Pop; tell me more about them," and it was evident that the boy was stirred by the same fires that had stirred his progenitor in the years long gone by.

"Well, I don't know what more there is to tell, Gerard (there goes a flock of redheads off there over the hay-field), only I do know that if you could see a pair of these greenheads swimming along the edge of the ice in the spring out on the old Platte, with the snowy bank for a background, you would see as hardy a picture as this prairie country affords. It is a stirring sight in March, on a bright, breezy day, to see the drake, a crimson-eyed beauty, feeling fresh in spirits and costume, passing swiftly up the broad valley thinking only of the fete that awaits him in the far north. Down in Deuel county, where I shot in the spring of '94, I saw a good many white and black tufted mergansers, but I have never seen one up here, although they must come here, as they are anything but rare, and in the fall and winter they go far up most all our rivers and visit our inland sloughs and marshes. They are shy and vigilant, feeding on small fishes, crustacea and aquatic insects. These they obtain without difficulty, as they are patterned greatly after the loon, and are magnificent divers. But of all the sawbill family, I think our little hooded merganser is the most interesting. The Indians use to call them the 'devil duck' on account of their mysterious and erratic movements, and they would no more think of killing one than a mountaineer would think of killing a magpie—it is an omen of bad luck. As I intimated before, their plumage is composed principally of sombre gray and drab tints, but on the inside of the wings there is a lovely pale rosy hue, reminding you of a dying sunset flush. We may get a crack at one before we leave, and I hope we do, for I want you to see one. Look out there, Gerard, what is that coming toward us—there in the water—don't you see it?"

"Where? Oh, yes. It is a muskrat."

While talking I had noticed a small, triangular-shaped ruffle in the placid waters approaching us, point first, and coming evidently from one of the half-whelmed hay-cocks which were scattered numerously all over this end of the lake.

Gerard was correct, and it pleased me to see that his lessons in nature's wild ways were not being thrown away. It was a rat, and he was making directly for the point of land on which our blind was located.

"Now keep perfectly quiet, Gerard," I whispered, "and we will watch this fellow and see what he does."

We crouched down low, and through the interstices in the tules kept our eyes on the little V-shaped waves approaching us. Closer and closer they came, until finally, when off about fifteen or twenty yards from the point, we caught sight of the rat's funny little flat face, with his whiskers sticking out from his puffy cheeks and his nostrils twitching queerly as he came on through the shallowing water with the gracefulness of a member of the funny tribe.

Right up to the low shore he came, and on reaching it, halted a moment, lifted up his round head, and with black eyes sparkling like diamonds in a brown setting, sniffed the atmosphere suspiciously once or twice, just as if there was some indefinite taint about it that he didn't quite understand. Perhaps he caught the odor of the dead ducks lying at our feet, but if he did he was evidently used to it, and apparently unconcerned he crawled quietly out upon the bank, his sleek coat shedding the last vestige of moisture as if he had been on dry land all morning, and shining in the sun like the boa about my lady's neck.

He waddled up to within a yard of the tules behind which Gerard and I lay, then sitting up on his haunches wiped his nose with one creamy paw, looked sharply into our crypt of reeds and flags, then set to work scratching and pawing at the roots of the smallest of the tules. He soon, with his flat incisors, pulled out a long, slender white tendril, and began to munch it complacently, and Gerard and I were tickled immensely at the sight. Through with the first root, which he seemed merely to bite into small fragments, holding it in his expanded jaws a brief interval, then ejecting it as if he had extracted all its succulency, he again began his excavations. Root after root was withdrawn from the soft soil and reduced to bits, and at last appearing as if tiring of the diet, he backed into the shallow water, keeping his piercing little eyes glued upon our blind the while, but evincing no timidity whatever. Once in the water, he doused his chubby head beneath it once or twice, washed his face with his hands, slapped the water joyously with his flat tail, rolled over, shook himself, and then set sail back toward the submerged haystack, in which undoubtedly he had built his water home.

He had left the shore but a few yards behind, when Gerard jumped suddenly to his feet, and with a whoop, fired an empty shell at him. There was an instantaneous splash, and from the midst of a caldron of roily waves we saw his flat, hairless tail spasmodically wriggling in the air, and the rat had gone as completely as if he had never existed.

"Wasn't he funny, Pop?" remarked Gerard, as he stepped out of the blind and gathering up a handful of the tule chaff the rat had left at the water's edge, came back, sifting it through his fingers, and continued: "I do not believe he ate a bit of this stuff, and was chewing it just to entertain us."

"He was getting the juice out of it, that was all. There, reach out and pull up one of those tender tule sprouts and I will show you what he was after."

Gerard found the task a greater one than he imagined, for he had to give two or three tugs at the wiry rush before its slender white root let go, and he pulled it forth and handed it to me, with the remark, "Gee! I do not see how that little animal pulls these things out so easily; he didn't seem to exert himself at all!"

"Well, he knows how. You see, the all-wise Creator has not quite taught us all, and as you go along through

life you will find that you can learn many things even from a muskrat. See here," and I broke the bleached extremity of the bulrush which was brittle, and squeezed from the end a thin whitish fluid into the palm of my hand. "There is what Mr. Muskrat was after—the milk of the tule root."

"Where do you suppose he is now?" and the boy gazed off toward the soggy dome of the haystack protruding from the distant waters.

"Safely out there, right where you are looking, in his home in the heart of that hay."

"Just what sort of an animal is a muskrat, Dad? They don't look any at all like the real rats in town. Are they plentiful about these lakes?"

"Very. They are a species of the beaver genus, and are peculiar to this country, being extensively distributed in suitable localities all over the northern part of this continent, clear from the Atlantic to the Pacific, and from the Rio Grande to the barren grounds bordering the Arctic Sea. They are always interesting to me, and I seldom shoot one in wantonness."

"But do they come out much in the daytime?"

"No. They are most active at night, and spend the greater part of the day concealed in their tule-built houses, or in their burrows in the banks, which consist of a roomy chamber with numerous passages, all of which open under the surface of the water. Like all rodents, they are omnivorous in their habits, although I doubt very much if they will eat flesh. Duck hunters, you know, think that it is the rats that carry away the dead ducks they are compelled by darkness to leave where they fell over night, but in ninety-nine cases out of a hundred it is a skunk, mink, otter or owl that gets the prize. However, while the denition of the muskrat—we always used to call them muskrats, and I like the old-day name, it takes me back to the Little Reservoir and Widener's Pond, when I was a little 'un like you—is adapted particularly to certain kinds of vegetable food; they are always mulling around any dead bird or animal they may stroll upon, but I hardly think they ever partake of much of the flesh of the same. The mussels of our streams, however, are devoured voraciously by them, and old Captain Whitehead, the old cabin boatman with whom I used to shoot on the Illinois, swore that they opened these mollusks without injuring the shell. So do you wonder that they know how to pull up a tule root? But funnier than this, Gerard, the old captain declared that a muskrat finding a mussel with the soft parts extruding, seizes it so quickly that these soft parts are pinched and become paralyzed, after which he finds no trouble in parting the shell and extracting the bivalve. This, however, I know from absolute research, is literally untrue, and it is only old codgers of the Whitehead stripe that believe such absurdities. But, say, Gerard, the ducks seem to have gone to sleep. What do you say, let us stroll back over toward Clear Lake and try them in the pass this evening?"

"All right; but the decoys?" and the boy motioned toward the bobbing counterfeits on the water.

"Oh, they are none of our doings. The Judge and Charlie will probably be back here themselves to-night. Here, shove these mallards and the merganser—or shall we take them both? Very well, push them all into my back pocket here; they won't bother me much, and you can tote the shell case awhile. That's the caper. Come on."

SANDY GRISWOLD.

Massachusetts and Maine.

BOSTON, Oct. 15.—*Editor Forest and Stream:* Brant Rock, Marshfield, is a well-known resort for sea fowl shooting. Last Sunday eighteen boats were ranged in a line stretching a distance of about 1½ miles out to sea from the shore. One solitary warden, Mr. Thomas Stackhouse, on shore, saw them and heard the shots. He procured a boat, but not unobserved by the many friends of the hunters who had gathered on shore to watch the sport. Some one of these had a huge megaphone, through which he sounded notes of warning to those in the boats. Other friends put out in a power boat, which was the signal for those in the dories to deposit in the launch the birds they had killed and their guns, thus preventing the officer from securing evidence. Mr. Stackhouse arrested one of the party, but was unable to produce in court such evidence as to satisfy the judge of his guilt, and he was discharged. If the Sunday law is to be enforced against the sea fowl gunners, there is need of a great number of officers at this season to cover the many points on the Massachusetts coast where gunners are to be found.

In some towns the local officers are doing good service for protection. One of the policemen of Plymouth had three Portuguese in court yesterday for shooting robins. One was fined for nineteen birds \$190; one for thirteen \$130, and the third man for two birds \$20.

It is reported that the moose secured by Dr. Bishop, as mentioned in my last letter, weighed 1,200 pounds. There are not always the conveniences at camps to get the actual weight of the big game killed. Of course, if one is guessing, it is just as easy to guess liberally as any way. If any of your readers have obtained the actual weight of moose they have killed, such information would be interesting, and if reported in these columns lead to the compiling of valuable statistics.

Mr. Freeman N. Young, of Arlington, has devised a novel conveyance for a hunting trap in Maine, combining a house and an automobile. The idea is a development of the "hay rigging" which Mr. Young used on his auto in a celebration on the 17th of June last. The house consists of the hay-rack boarded up on the sides and at the rear end. Two iron girders support a mattress on which the travelers sleep. Under the bed section is a kitchen. Electric lighting and heating are provided. On this trip of two weeks or more, Mr. Young is accompanied by Dr. A. H. Tuttle and Mr. R. A. Frye, of Cambridge.

Although it was cold and wet at Barre most of the week, the Brunswick Fur Club meet was a success in furnishing much sport, although it would appear from the results of the chase that the foxes in that region are "on to the game," as the saying goes. Conspicuous among the lady riders were Mrs. T. W. Pierce, of Topsfield, and Mrs. Raymond Whitman, of the Myopia Club.

To-day is the first of the open season on moose in Maine, and it continues till December 1. Reports that have come in from various sections of the State indicate

that moose are more than usually plentiful. The figures for the first two weeks of the deer hunting season show a falling off in the number from 393 in 1903 to 368 the present year.

The past week has seen quite a hegira of Massachusetts sportsmen for the Maine woods. A good idea of the number of hunters who leave Boston for Maine in the fall may be obtained from the fact that for licenses (\$15 each) the firm of Iver Johnson & Co. last year returned to that State over \$3,500. On Friday Messrs. H. A. Spear and W. H. Pierce, of Boston, left for the North Woods. W. O. Taylor and two friends have been waiting at Moosehead for an opportunity to slay the king of the forests. One of the crack shots of the University City, Miss Carrie Lamb, with her mother and guide, is already at Ox Bow. Mr. R. D. Jones, of the B. & M. ticket office, and his wife, will soon leave for a hunting trip in Newfoundland. They go into the region north of Eagle Lake, where no white woman has ever been.

Mr. H. W. Davis, a well-known Boston sportsman, has just returned from Palfrey Lodge, just across the border from Vanceboro, with a fine moose, and yesterday Mr. H. M. Sears, of Boston, and two friends started for the same place. Mr. William S. Hinman, president of the Massachusetts Fish and Game Protective Association, left Boston for the Maine woods with a party of friends last Tuesday.

CENTRAL.

King Edward as a Sportsman.

NOWHERE where pheasants fly is the rearing and shooting of them more carefully organized than on the King's estates at Sandringham. Mr. Jackson, the head keeper, has the regular duty of rearing 10,000 pheasants annually. The eggs are placed in incubators until within four days of hatching time, when they are laid ten at a time under 1,000 barn-door fowls, each setting in a separate box.

It may be imagined that the hatching season is one of no small care and anxiety to the head keeper. When they have emerged from their shells the young birds are placed in little pens and dragged on trolleys to woods on different parts of the estate. They are carefully watched, protected, and fed, until the time comes for turning them loose into the woods. Even then they are the subject of the keeper's unceasing care.

As for the weapons of attack, his Majesty is one of the best judges alive of a good gun, and his gun room at Sandringham, with its glass cases fitted with guns for every conceivable purpose, is admitted by all his sporting companions. Complete as it is to the last degree, scarcely a year passes but some new gun is added to the collection. The sort of gun which his Majesty most likes is one which is quite plain and unornamented, and which has a very light pull on the left trigger.

It is a great day at Sandringham when the King and his party are abroad with their guns. Notice of the shoot has been given in advance all over the estate, and farm work is partially suspended, so that there shall be no undue disturbance of the birds. In the early morning of the day of the battue, the keepers in their bright royal livery of green and gold take a hundred beaters out with them and station them at their places.

In their blue blouses, with white lace fronts and wearing soft felt hats with scarlet colored bands, the beaters themselves are picturesque enough. The rendezvous and time of assembly are fixed the night before, and it is the custom for the guests to make their way to the appointed place in any manner which best suits their convenience, and there await the coming of the King.

It is seldom that the numerical strength of the party exceeds eight or ten guns, but all of them are first-rate shots. It is not that the King has retained any anxiety since that distant day when, as Prince of Wales, and out shooting with some friends, he was hit by a quantity of pellets from the gun of one of the latter, but that being a first-rate shot himself and enjoying all the best instincts of the true sportsman, he simply cannot tolerate bad work with the gun.

Each member of the party works with two loaders and from two to four guns. The game book at Sandringham has been most carefully kept for many years, and it shows that on more than one occasion from two to three thousand and head of game have been accounted for in a single shoot.

Game carts have in advance been despatched to various places, and in due course the big bag is sent home to the royal larder, which, capable of holding 6,000 head, is second in size only to that established by the late Baron Hirsch, which will contain 10,000 head of game.

The shooting luncheon, either at Wolferton Station, the little cottage which goes by the name of the "Folly," or at one of the farmhouses on the estate, is always a most delightful meal on such occasions as this. It is plain but good, the chief item on the menu being not infrequently a kind of Irish stew, which is particularly grateful after the hard morning's work.

The Queen and her friends will often seek out this retreat and join the party at luncheon, but both their Majesties are conspicuously averse to the practice which has obtained at some country houses of ladies walking with the guns. At the close of the day the total bag is laid out on the lawns for the King's inspection before being finally consigned to the larder, whence it is despatched to hospitals and charitable institutions, his Majesty's friends, and his tenantry.

Sixty-two years of life have increased rather than decreased his Majesty's ardor for the gun, and his hand and eye are as good as ever when he has to deal with high birds with the wind behind them. The single indication of the sexagenarian is in the increasing use of the little shooting pony.—London Daily Express.

Pheasants in California.

SAN FRANCISCO, Cal., Oct. 11.—*Editor Forest and Stream:* About seven years ago this commission purchased some 400 Mongolian pheasants in Oregon, which State was originally stocked direct from China, and where they gained a substantial foothold. The climate of Oregon is much more suited to the birds than is that of California. They require plenty of cover and water. In places of that kind they seem to have done well and increased in this State. In addition to the birds purchased in Oregon, we secured about 200 more direct from

China. They were liberated in localities that were deemed most suitable, and while they do not show a marked increase, still there has been a gain, especially along some of the river bottoms that are heavily wooded and contain plenty of underbrush, although in such places the ground varmint seem to destroy many of the nests and young birds.

On some of the large "ranches" where range-riders are employed and the varmint are trapped and destroyed, the birds have made a very perceptible gain, but taken as a whole, they have not increased sufficiently to allow any season for killing. There is an absolutely close season in effect at this time.

We are endeavoring to secure Bob White quail, believing they will do well in our large valley grain fields.

CHAS. A. VOGELSANG, Chief Deputy.

Col. B. W. Sperry.

I HAVE just heard, with a sense of personal loss, of the death of Col. B. W. Sperry, of Jacksonville, Florida, and I ask myself, Who next? For Col. Sperry, though a man approaching sixty years, was still in the prime of life in vigor and activity, and seemingly one of those spirits which know or acknowledge neither years nor the infirmities that years impose. As a sportsman he was just what the word sportsman implies. All who knew him—and they were many, from every section of the country—were prone to say, "The Colonel is of the stuff that men are made of." Those who were so fortunate as to have been afeld with him, will recall with a keen pleasure his generosity as a field companion, and regret, as does the writer, that those days can be no more. Experience teaches us all that the record our memory makes of the men with whom we have fished and hunted is not altogether of a symphony of human souls. On the contrary, these records oftentimes reveal a series of disappointments in men; so that a mental glance of our past experiences is like a visible study of the stars at night; some are brighter than others, and it is the bright ones that interest us most, and their disappearance would make the world darker. And so as to Col. Sperry, I feel that in my little world of acquaintances one particularly bright and interesting star has gone, and a sadness comes with the knowledge.

For over thirty years Col. Sperry was a subscriber to *FOREST AND STREAM*, and one of the first things he called the visiting sportsman's attention to on entering his office, were the racks containing these papers. Then came his gun and rod cabinets, with the cordial assurance of "If you are short on anything, I can probably help you out, and I'll be glad to do so."

T. E. BATTEN.

In the New York Line Counties.

ELMIRA, N. Y., Oct. 15.—*Editor Forest and Stream:* Noting in your "Notes from the Game Fields" the report from Sayre, Pa. (M. Chill) that game is plenty in this section, I would request that Brother Chill use the words "has been", as I can vouch for a big lot of good hard hunting and tramping on the part of both dogs and men with very little to show for it in the way of game. Bruceport, Erin, Park Station, and Van Etten, all along the L. V. R. R. from this city, are shot out. I was told of three men getting 21 birds in a day's hunt some time ago in that section. I think the larger part were woodcock. As for quail, there is none to speak of in this section. Have had reported one or two small bunches seen this fall. However, they must be scarce, as I have tramped this country over in good shape with good men and dogs and have not started one quail.

The grouse are so well educated that at the first flush they light on the clouds. What rabbits have been killed are as poor as Job's turkey. Why? I can't tell, except the fat is all chased off them. I never killed them in better condition than they were last year.

E. H. KNISKERN.

Fined for Dusking Ducks.

CENTRE MORICHES, L. I., Oct. 13.—There has been much "dusking," or shooting after sunset, for black ducks since the season opened, and Howell C. Smith, of East Moriches, a special game protector, knowing that parties might not take kindly to arrest, took ex-Police Sergeant William E. Petty with him a few evenings ago, hoping to catch somebody red-handed. They sneaked along the beach to where a party had out decoys, and when a flock of ducks were shot at and one fell dead, the two men were right at hand. There was some pretty hot talk, but the ex-sergeant carried and displayed a revolver, and the arrest of the "duskers" was made without trouble. The men were taken before Justice R. P. Howell, of East Moriches, who fined each \$25.

The men were George Humphreys, of Brooklyn, who was here with his steam launch, and his assistant, Alonzo Horner. After it was all over, Mr. Humphreys told the game protector that the latter had only done his duty, adding that "dusking" ought not to be allowed.—Brooklyn Eagle, Oct. 15.

His Thoughts.

From the New York Times.

IN THE COUNTRY.

As I lie beneath the willow,
With the whole earth as a pillow,
The whistle of the quail breaks all my joy;
For that whistle clear and free,
Brings the office back to me,
And unthinkingly I shout: "Oh, drat that boy!"

IN THE CITY.

Oh, my bosom heaves with joy,
As the prankful office boy
Sits loudly whistling up and down the scale;
For that whistle clear and free,
Brings the country back to me,
And unthinkingly I look up for the quail.

F. P. FITZER.

Helped Through the Phrase.

"Pardon me," said the seedy-looking man, who was laboring over a letter in the hotel writing room, "but can you tell me how to spell 'temporarily'?"

"Certainly," replied his shrewd neighbor, giving the desired information, "and the other word is 'c-m-b-a-r-r-a-s-s-e-d.'"—Philadelphia Press.

SEA AND RIVER FISHING

Fish Chat.

BY EDWARD A. SAMUELS.

The Tautog or Black Fish.

AMONG the fishes on our coast which are ranked as commercial species, but which are also included by many in the list of game fishes, the tautog occupies a not insignificant position. Its value as a food fish has long been recognized, but until a few years, comparatively speaking, it was more an object of attention to the "hand-line brigade" than it was to those anglers who were satisfied with nothing short of the use of the rod and reel. But now its fame as a strong and sturdy fighter is so well established, the number of anglers who seek it with more elaborate tackle than that which was formerly used has become quite large.

Distribution and Habits.

From the Delaware Bay all along the shore northward to Cape Anne, Mass., it is more or less abundant, being most plentiful in localities where there are ledges and rocky reefs overgrown with kelp and other marine plants, among which it gleams its food.

It may possibly occur north of Cape Anne, but I have never known of one being so taken. From the rocky cliffs of Eastern Point, Gloucester, I have had my best success with this species, the fish averaging of good size and very gamy, particularly when hooked in the heavy surf, which almost always pounds that rugged shore.

A considerable number are also taken from the kelp-covered rocks of Nahant; the estuaries of some of the rivers further south on the coast, such, for example, as the Weymouth River and the stream which flows from Scituate and Marshfield teem with this species, but they do not there attain the large size which is often seen in Vineyard Sound.

Large fish are also taken over the submerged ledges near the Minot's Ledge lighthouse, off Cohasset. South of Cape Cod it is one of the principal species caught in the weirs and pounds, as is shown by the reports of the Massachusetts Commissioner of Fisheries and Game; but so destructive are those traps, the catch is becoming less and less annually, and the average size of the fish is also decreasing. Tautog weighing 5 to 8 pounds twenty years ago were common, but are now rarely met with, and if we were to inspect the catches all along the coast, we probably would not see a 10-pound fish oftener than once or twice in a season.

Nomenclature.

In some portions of Buzzard's Bay and thence south, it is known popularly as the "black fish;" the name tautog is being dropped throughout its southern range.

There are many rocky reefs in the Sound and along the coast of Long Island where the tautog is pretty abundant, some quite large fish being taken over the reefs off Rye and Port Chester. An angler of my acquaintance creeled fifteen fish at Rye in one tide last season, which weighed over sixty pounds, and this may, I think, be considered a record catch for these times; an average of over four pounds being something remarkable.

Tackle and Bait.

In angling for tautog, my favorite rod is a stiff bait-rod, not so heavy as that usually employed in striped bass fishing, but stout enough to withstand a severe struggle with a heavy fish. This species is remarkably strong, its thick, deep body, combined with great breadth of fins, gives it a wonderful power of resistance to the rod. A glance at its sturdy body would convince even an inexperienced angler that the fish has all the essentials for a stubborn fight, and this is proved by the first encounter with one that falls to him. Long, swift runs it does not make; neither does it break water, even when the time for the landing net has arrived, but it "hugs down" to the bottom with the greatest pertinacity, a bulldog obstinacy, as it were, a 6 or 7-pound fish at the end of six to eight fathoms of line being sufficient to test the strength of almost any bait-rod that is in common use.

As for bait, almost anything goes; a piece of shedder crab or lobster, sand-worm or clam, being acceptable in most localities. My best success has been with small crabs an inch to an inch and a half in breadth, such as are plentifully found beneath rocks and seaweed along the shore where they have been left by the receding tide.

In biting, the tautog lacks the bold rush of the squeague or the bluefish. Genio C. Scott, in treating of this, says: "The tautog bites like the sheephead, but with less power. You feel the premonition, but when he dashes aside the pull is weaker than that of a sheephead. I mean now a tide-running tautog of from 3 to 8 pounds which feeds on the edge of swift water, has a white nose, and is fair game."

The tautog which feeds close to the base of the rocks is an adept in getting hooks or sinkers fast in the clefts. Accustomed as it is to glean its food of small mussels, barnacles, crustaceans, etc., among the kelp in a leisurely way, it takes the bait in a sort of indolent, half-hesitating manner, but the moment the hook strikes home in its tough, leathery mouth, it darts beneath the shelter of an overhanging rock or ledge, from which, if the fish is of any considerable size, it is dragged only with a severe struggle. This shelter-seeking habit has caused the loss of many a fine fish and no end of tackle, and the experienced angler never dallies when the tautog is first struck, but lifts the rod sharply and raises the fish above any possible lurking place.

Although it is a bottom feeder, as a rule, and is taken by still-fishing, Mr. Scott describes a method for capturing it which may be worth a trial by the angler who is of an experimental turn of mind. He says that an angler

of his acquaintance sculled his boat to the edge of the tide on the banks between a rapid current and nearly slack water, and near an islet or reef of rocks in the Second River where the water was about fifteen feet deep, anchored his punt, and standing up in the stern he cast some seventy-five feet of line armed with two hooks about two feet above the sinker and baited with clam. "In this way," says Mr. Scott, "I have known him to take 100 pounds of tautog in an hour."

Is Salmon Culture Profitable?

In FOREST AND STREAM for August 20, The Old Angler reiterates his conviction that the artificial stocking of our salmon rivers is unprofitable and impracticable, and that if the salmon is to be preserved it can be done only by very greatly curtailing the privileges now enjoyed by netters. In his communication he criticises some of the statements I have made, asserting that they are founded on information which has been obtained second-hand, and largely from unreliable sources, such as guides, boatmen, overseers of fisheries, etc. Now, I have nothing but the most friendly feeling for The Old Angler, and I regard him as one of my most valued correspondents. I know he is quite fully informed in fishing matters, and that everything he says is entitled to most respectful consideration; but no one is infallible, and I believe that his views on artificial propagation of salmon as a means of restocking our rivers are, in a measure, erroneous. If I am entirely wrong in my opinion, and he is right in his, the extirpation of the Atlantic salmon is only a question of time.

My contention is that the artificial stocking of our rivers will do much to keep up the supply of fish, but this alone will not bring about the desired result, for no matter how abundantly the rivers are thus stocked, if the existing conditions of excessive netting are continued, the supply inevitably must fail. In this last respect The Old Angler and I agree; we both believe that the destruction caused by the nets must, if possible, be stopped; but if that is not practicable, it should be curtailed to the smallest possible limit, in order that a fair share of the fish may be spared to ascend the streams and carry out the work of reproduction in a natural manner.

Now, I do not profess to be a scientific fishculturer. I wish I were one, but I know something of the art, for I have investigated it personally and studied its feasibility and economic value, so that what I know of the matter is not obtained entirely from hearsay. That I am not right in my belief that our salmon rivers may be artificially stocked, has not yet, in my opinion, been shown, and I find, the more I look into the matter, that my belief is shared by a great many other observers.

Evidence from the Blue Book.

The Old Angler often refers to the Reports of the Dominion Commission of Fisheries as containing facts and figures which seem to substantiate his theories. I also find in them many statements which support me in my convictions, and from these I will make a few selections. Isaac Sheasgreen, superintendent of the Miramichi hatchery, in the last blue book, 1903, says: "While considerable evidence could be given to demonstrate the benefit resulting to the waters of the Miramichi from the operation of this hatchery, I feel that as the work of keeping up the supply of salmon by artificial breeding has been so thoroughly proved successful, it is needless in this report to adduce any other evidence than that the statements from all reliable sources show that the salmon fishing and angling during the past year have been well up to the average, and show no signs of decrease. Notwithstanding the enormous strain that is put upon it by reason of the large number of netters operating their traps every year from the mouth of the bay to the head of the tide on the main river, as well as all the branches, and besides, every available portion of the non-tidal waters yields its quota of fish to the sportsman and angler. The rivers are all abundantly supplied with breeding fish; grilse and parr are also seen in great numbers in all the streams tributary to the Miramichi."

Alexander Mowatt, superintendent of the Restigouche hatchery, reports that: "All travelers up and down the rivers, with whom I have been talking, say they have never seen the salmon more plentiful than they were this year (1903). The guardians are unanimous in corroborating this. As I stated in former reports, with good protection, combined with the good work the hatcheries are doing, there need be no fear for the welfare of the salmon fisheries of the Restigouche."

L. N. Catellier, superintendent of the Tadoussac hatchery, states that "Mr. Simon Dufour reports that he never saw so many salmon on the spawning grounds for the last twelve years, while guardians of the River St. Marguerite. * * * Chas. Angers, Esq., M. P. for Charlevoix, informs me that the planting of salmon fry in the River Murray is a success."

Mr. Alfred Ogden, superintendent of the Bedford, N. S., hatchery, reports that "Bedford Basin and Sackville River are each year showing a large increase in salmon; some have been caught with fly in the river, and quite a number have been taken in nets in the basin."

That the artificially hatched salmon fry are as healthy and vigorous as those produced in the natural manner, I have always believed, but to be absolutely certain on this point, I sent the following circular note to a number of officials connected with the fisheries.

"1. Will you kindly inform me whether or not, in your opinion, the artificially hatched salmon fry compare favorably in health and vigor with those which are hatched naturally in the river."

"2. Are salmon streams benefited in any considerable degree by planting in them salmon fry artificially hatched?"

To these interrogatories I have received the following replies:

"STOWE, Vt.—*Edward A. Samuels*, Dear Sir—Your favor of recent date, in relation to the planting of artificially hatched salmon fry in Vermont waters, received. From my experience in the past, and point of view at the present time, I am convinced that the planting of salmon fry has been successful. Only a few years ago there were no salmon in Vermont waters. Lake Caspian, Willoughby Lake, and several ponds have been stocked with salmon fry, though these waters previous to that were inhabited by trout. Willoughby Lake also had maskinongé. Salmon have seemed to thrive and are vigorous healthy stock, and this year many good catches have been made."

"It is my opinion, in relation to the health and vigor of artificially hatched salmon, in comparison with those hatched naturally in rivers and ponds, provided that the artificially hatched are taken from other waters than those in which they are planted, they would be more vigorous and the native stock improved. I think this has been fairly well demonstrated and proven, and methods on this line are adopted at our hatchery. H. K. THOMAS."

"MIRAMICHI HATCHERY, South Est., N. B., Aug. 20, 1904.—*Dear Sir*—I have just returned from the headwaters of the Miramichi, and find your circular note awaiting a reply."

"In answer to the interrogatories contained therein, I may say that, in my opinion, artificially bred fry compare very favorably with those that are hatched naturally. My experience during the past twenty-five years has been altogether with salmon and trout, and it is my firm belief that there is no difference whatever between the fry turned out of the hatcheries and those hatched in the natural way. My observations lead me to believe that they are just as strong and vigorous as the fry bred in the beds of the streams."

"There consequently cannot be any reason why the rivers in which large numbers of these artificially bred salmon fry are planted should not be immensely benefited thereby, and it is conceded by nearly all the fishermen of the Miramichi that salmon culture, as carried on here, has been a great factor in supplying the demand that is annually made upon this fishery in these waters."

"WILLIAM SHEASGREEN, F. V."

"BEDFORD, N. S., Aug. 5, 1904.—*Edward A. Samuels, Esq.*, Dear Sir—I beg to acknowledge receipt of your circular letter, and in reply to question No. 1 would say that I firmly believe salmon fry artificially hatched do compare favorably in health and vigor with those which are hatched naturally in rivers."

"No. 2—Salmon streams are benefited to a large degree by planting in them fry artificially hatched."

"It is estimated that not more than 4 per cent. of the ova deposited naturally in streams ever live to age of six weeks, or fry stage of one inch in length; whereas at the hatcheries fully 75 per cent. of the eggs taken from the parent fish are hatched and planted when about six weeks old or about 1 to 1½ inches in length."

"About six years ago I had all obstructions removed from the Sackville River at this place, giving the fish a clear run to the lakes from the sea, and since then have been planting from 20,000 to 40,000 fry each year. To-day there are large numbers of salmon in the Bedford Basin waiting for the waters in the river to rise so they can ascend."

"There are no deep pools in this river, consequently not good for fly-fishing. A considerable number of salmon have been netted during this open season in the basin."

"ALFRED OGDEN."

The above statements, coming as they do from experts, show conclusively that The Old Angler is not without a degree of error, at least in his assertion that the artificial culture of salmon is valueless as a factor for restocking our rivers, and that my claim that it is not only feasible, but eminently profitable, is correct, and that the time and money which have been expended on it have not been wasted.

Barnegat Sea Fishing.

ASBURY PARK, N. J., Oct. 15.—This bit of Jersey coast claims to be a good fishing pond; but we do have to lower our colors to Barnegat sometimes when it comes to taking in a big load of bass and sheepshead. A party went from here to Barnegat the other day, headed by John F. Seger and Captain Fenimore, who returned home yesterday.

There were twenty-two in the party, and a jollier and more congenial crowd it would be hard to find. They stayed during the outing as the guests of Mrs. James H. Komaine, of the Sunset Inn at Barnegat City. Altogether 3,245 pounds of channel bass were taken, 71 pounds of striped bass, and one sheepshead weighing 15 pounds was captured by Robert A. Inch. Captain Fenimore hooked the largest fish, a channel bass weighing 73 pounds. Frank Conway got the largest striped bass, a 22-pound beauty.

Captain Fenimore not only caught the largest fish, but also caught the highest number of pounds, taking altogether 393 pounds. Robert A. Inch came next with 335, and L. P. Streeter third, with an even 300. In the words of the fishermen, "it was a grand trip," probably the best they have ever had, and next year they expect to take many others who did not go this time.

Following is the catch of each member of the party according to the figures of the statistical secretary, John F. Seger:

Charles A. Atkins—36, 44½, 42¾; total, 123¼.

J. Woodruff—26.

Winfield Scott—36, 26; total, 62.

A. J. Dosch—40, 29, 24, 28, 27, 31, 21, 24, 25; total, 250.
 W. Gilbert—35, 24, 26; total, 85.
 Captain G. W. Fenimore—25, 26, 29, 45, 73, 25, 41, 27, 31, 41, 30; total, 393.
 Robert A. Inch—25, 27, 31, 30, 24, 28, 30, 27, 26, 22, 25, 25; sheephead, 15; total, 335.
 L. P. Streeter—23, 30, 26, 26, 32, 26, 26, 24, 32, 28, 27; total, 300.
 Cyrus Detre—35.
 E. J. Hudson—22, 23; total, 45.
 J. F. Seger—27, 31, 19, 28, 26, 26, 43, 27, 28, 31; total, 286.
 L. F. Douglass—23, 25; total, 48.
 E. P. Johnson—27.
 E. C. Rahe—19, 38, 38, 40; striped bass, 2½; total, 134.
 E. B. Stout—35, 39; striped bass, 12; total, 86.
 Charles F. Schukraft—47, 26, 35, 20, 20½, 19, 28, 23, 25, 25; striped bass, 8; total, 277½.
 John L. Hoffman—26, 18½, 28, 35, 19½; total, 127.
 Robert R. D'Bacher—16, 28½, 32, 16, 24½, 23½, 25; striped bass, 20; total, 185½.
 Fred. Wilkie—28, 19½, 17, 24½, 24; total, 113.
 Frank Kinbacher—26, 18, 18, 16½, 15, 14½, 13, 19½, 28, 24, 23; total, 217½.
 Frank Conway—22, 26, 28, 26, 27, 25; striped bass, 22; total, 176.
 All the above are in pounds, and are channel bass unless otherwise specified.

The Striped Bass of the St. Lawrence.

WASHINGTON, D. C., Oct. 15.—*Editor Forest and Stream*: In the number of FOREST AND STREAM for October 15 (p. 527), is a communication from Mr. E. T. D. Chambers, in which the "bar" of the St. Lawrence is identified with the common striped bass (*Roccus lineatus*). I am not aware that that species is found, as a regular inhabitant, in the Great Lake basin, although wanderers do sometimes find their way there. The common striped bass, or bar of the lake basin and St. Lawrence, is quite a distinct species (*Roccus chrysops*), practically confined to fresh water and occurring not only in

the lake system, but also in the Mississippi basin system. It never attains the size of the striped bass, and is a deeper and more compressed fish, has a more arched back, and the teeth on the base of the tongue are in a single patch instead of two rows; the ground color is also generally lighter, and the dark stripes narrower than in the striped bass. There are other minor differences, but those enumerated will suffice to distinguish the two species. It is quite possible that the fish of 32 pounds noticed may have been an astray of the true striped bass. It would, indeed, be a giant for a true bar. More information is required.

The Acrobatic Grilse and Others.

Editor Forest and Stream:

The charming story by Mr. Newberry, "Grilse on a Trout Rod," and written straight from his heart, yet shows that in his enthusiasm he makes statements that would hardly be voted correct by a jury of his brother anglers. This is rather to his credit; we have all done the same. But really, does he seriously go on record as confirming the statements in his final paragraph, as follows?

"Black bass? Pooh! Speckled trout? Stuff! Rainbow trout? Bosh! Grayling? Fiddle! I have caught them all over and over again, and they don't for an instant compare with the acrobatic grilse. The salmon is the king of fish, and to take grilse on a trout rod is as good sport as this world has to give."

Some of Mr. Newberry's fellow anglers were in Newfoundland last summer, and took grilse on a trout rod. The sport was royal! But let a fisherman take rainbow trout on the Baldwin in Michigan, small-mouth black bass at Delaware Water Gap, and especially the lordly grayling on the Au Sable River in Michigan, and it will be strange, indeed, if he does not tip his hat in entire respect for either and all of these game fish. Or let Mr. Newberry try the ouananiche at Red Indian Lake in Newfoundland; or better still, that demon of the salt water, the savage bluefish, and he will, I feel sure, not insist on saying "Pooh!" "Stuff!" "Bosh!" and "Fiddle!"

L. F. BROWN.

The Kennel.

Alabama Field Trials.

HUNTSVILLE, Ala., Oct. 14.—*Editor Forest and Stream*: In order to get a few notes of interest before the sportsmen of this country relative to the coming field trials to be held at this place under the auspices of the Alabama Field Trial Club, commencing December 12, I desire to call special attention to the Free-for-All stake, which has a guaranteed purse of \$300 to run for.

This is the second season a Free-for-All stake has been offered by this club, and if successful we hope to increase its value until it will attract the best talent of the country.

The hunting grounds are well located, being only a few minutes' ride from the city, and promise to afford plenty of birds for trial purposes.

Special arrangements will be made to provide participants with all necessary accommodations at a nominal cost.

The services of the best judges that can be obtained will be secured, and we hope to make the event successful, both socially and financially.

We respectfully solicit the patronage of sportsmen and fanciers, so "come one, come all."

J. M. KIRKPATRICK, Secretary.

Points and Flushes.

The Southern Beagle Club have issued the programme of their third annual meeting and field trials for 1905. The trials are fixed to be held at Centreville, Miss., on February 21. The programme can be obtained of Mr. John Redhead, secretary, Centreville.

YACHTING

Cash System for Clubs

BY EDWARD M. MACLELLAN, CHAIRMAN HOUSE COMMITTEE, MANHASSET BAY Y. C.

To those responsible for the business management of yacht clubs, probably the most vexing question is that of supervising the details of the book accounts, particularly as regards members' monthly house checks.

When the treasurer has the spare time, coupled with a knowledge of accountancy sufficient to enable him to work out the detail of his monthly statement and see that such details are properly shown, the work of the governing board is materially simplified. It is more often the case that this officer cannot give the time which the work properly requires, with the result that it is carried on either by the club clerks or by an accountant. In the former case, owing to the difficulty of securing competent clerical assistants, because of the short season of employment, the results reached are more or less unsatisfactory, while with the average accountant the trouble lies in failure to appreciate the necessity of having the same man carry on the work, instead of detailing a different man each month, the effect being that there is no one with a sufficient grasp of the many details involved to prepare an intelligent and concise statement.

It is a fact that clubs generally do not secure the best prices for supplies, for the reason that, rightly or wrongly, such accounts are looked upon by dealers as long time ones, so that an additional percentage is charged as an offset. No better reason can be named for this than that it is generally customary for the club to allow members a credit of from thirty to ninety days on their accounts. As the average club is not blessed with a large working capital, the dealer has to wait, and this is aggravated where the by-laws governing members' credit are not enforced, often because of a disinclination to drop men who are fully able to pay their accounts, but do not do so, either because of slack business methods, or through a lack of comprehension of the fact that club accounts should be paid when due.

It is generally agreed that in the detail of club management at least, England is many years in advance of this country, and it has long been customary there to require cash payment for supplies, the doorkeeper calling the attention of the member to this rule when overlooked. The control possible in a city club house, with but one or two entrances, is impossible in a yacht club, where also it is inadvisable to require payments in cash, owing to the necessity for employing large numbers of extra servants to care for the week-end business, who may be more or less irresponsible.

Practically the bulk of club bookkeeping consists in properly distributing, charging and collecting members' house account checks, without which the accounting work would be reduced to a minimum, while at the end of the fiscal year every club has a greater or less balance due from members for unpaid house accounts, which the use of a cash system would eliminate. The question then becomes one of how best to put such a system into operation without the promiscuous handling of money by the club servants.

Among many of the golf clubs a coupon book system has been in use, as a rule with some degree of success, although when given a trial in the Royal Canadian and Marblehead Corinthian Yacht Clubs it did not find favor. The club supply books used by the Manhasset Bay Yacht Club are in many respects similar to those used in the

clubs named, except that in detail they have been arranged and carried out in such manner as to insure against objection to their introduction by the members.

The books are printed in denominations of one, five, ten, twenty dollars, each denomination having a different colored cover, the coupons being also printed on different colored stock, according to their value.

The one dollar books have manila covers and contain twenty 5-cent coupons, printed on white stock.

The five dollar books have green covers and contain ten 5-cent coupons on white stock, twenty 10-cent coupons on yellow stock, and ten 25-cent coupons on blue stock.

The ten dollar books have terra cotta covers and contain the same coupons as the five dollar books, also ten 50-cent coupons on pink stock.

The twenty dollar books have a blue cover and contain the same coupons as the ten dollar books, also ten \$1 coupons on gray stock.

This variety of books enables the member or visitor from another club to purchase supplies in any quantity. The following conditions are printed on the back of each book, and govern their use:

This book is valid only when stamped with the club stamp and the name of the purchaser written on the cover.

Where an entire book is exchanged for supplies, it is requested that the cover of same be destroyed to prevent the book being re-issued.

Unused portions of club supply books will be redeemed at the club office, to amount of remaining coupons, providing same remain undetached from the cover of the book.

EXTRACT FROM BY-LAWS.

Chapter II.

Section 1.—Members and visitors, before obtaining supplies of any kind, at the club house, must purchase club supply books, which may be had at the office in the club house, of the House Committee, or of the club treasurer, which books must be paid for at the time they are delivered.

Section 2.—Coupons from a club supply book to the amount of check covering the supplies furnished, shall be exchanged for all supplies.

The supply books are in the custody of the club treasurer, who from time to time furnishes them to the clerk in charge in such quantities as the business of the club requires, this clerk turning in to the treasurer his collections for books sold, which, together with the books remaining on hand, must balance with the amount represented by those originally furnished him. As the books are numbered, and the handling of cash is thus confined to but one employe, there is practically no chance for leakage.

A daily record is kept of all coupons turned in by the various departments, the difference between the aggregate of these and the books sold to any given date representing the amount in which the club is indebted to the members. This amount during the past season has averaged \$250, while last year the average indebtedness of the members to the club was about \$3,800.

At the Manhasset Bay Club, coupons are exchanged for all supplies furnished, including restaurant and gasoline; they are also taken for stage fares and expressage, so that no money is received at the club except what is paid in for the supply books.

After a season's trial of the supply book system, the Manhasset Bay Yacht Club has demonstrated that the principal objection to its adoption—i. e., that it would cut down the business done by the club—has no foundation in fact; for in spite of the present season having been the worst that yachting has experienced in many years past, the business done has been excellent, and a good profit

shown in the paying accounts. It has been found that those members whose expenditures do not require their close consideration, spend more than ever, while to the good fellow with the champagne appetite and beer income, the supply book has proved a blessing in disguise.

Beyond the question of possibly reducing the volume of business done, the only other objection brought against the supply book, was that of the inconvenience caused to members through requiring them to purchase and carry these books. It is only fair to bear in mind that in every club there are a few men who assume the responsibility and give their time and best efforts, in order that the organization which is their hobby shall become a permanent success. If through the adoption of the supply book the amount of work, supervision and expense to the club is materially reduced, the member at large, who has any interest in the advancement of his club, will not consider for a moment the slight amount of trouble which its use entails to him, and this has emphatically proved to be the case in the Manhasset Bay Yacht Club, for there has not been a single complaint against its use during the past summer.

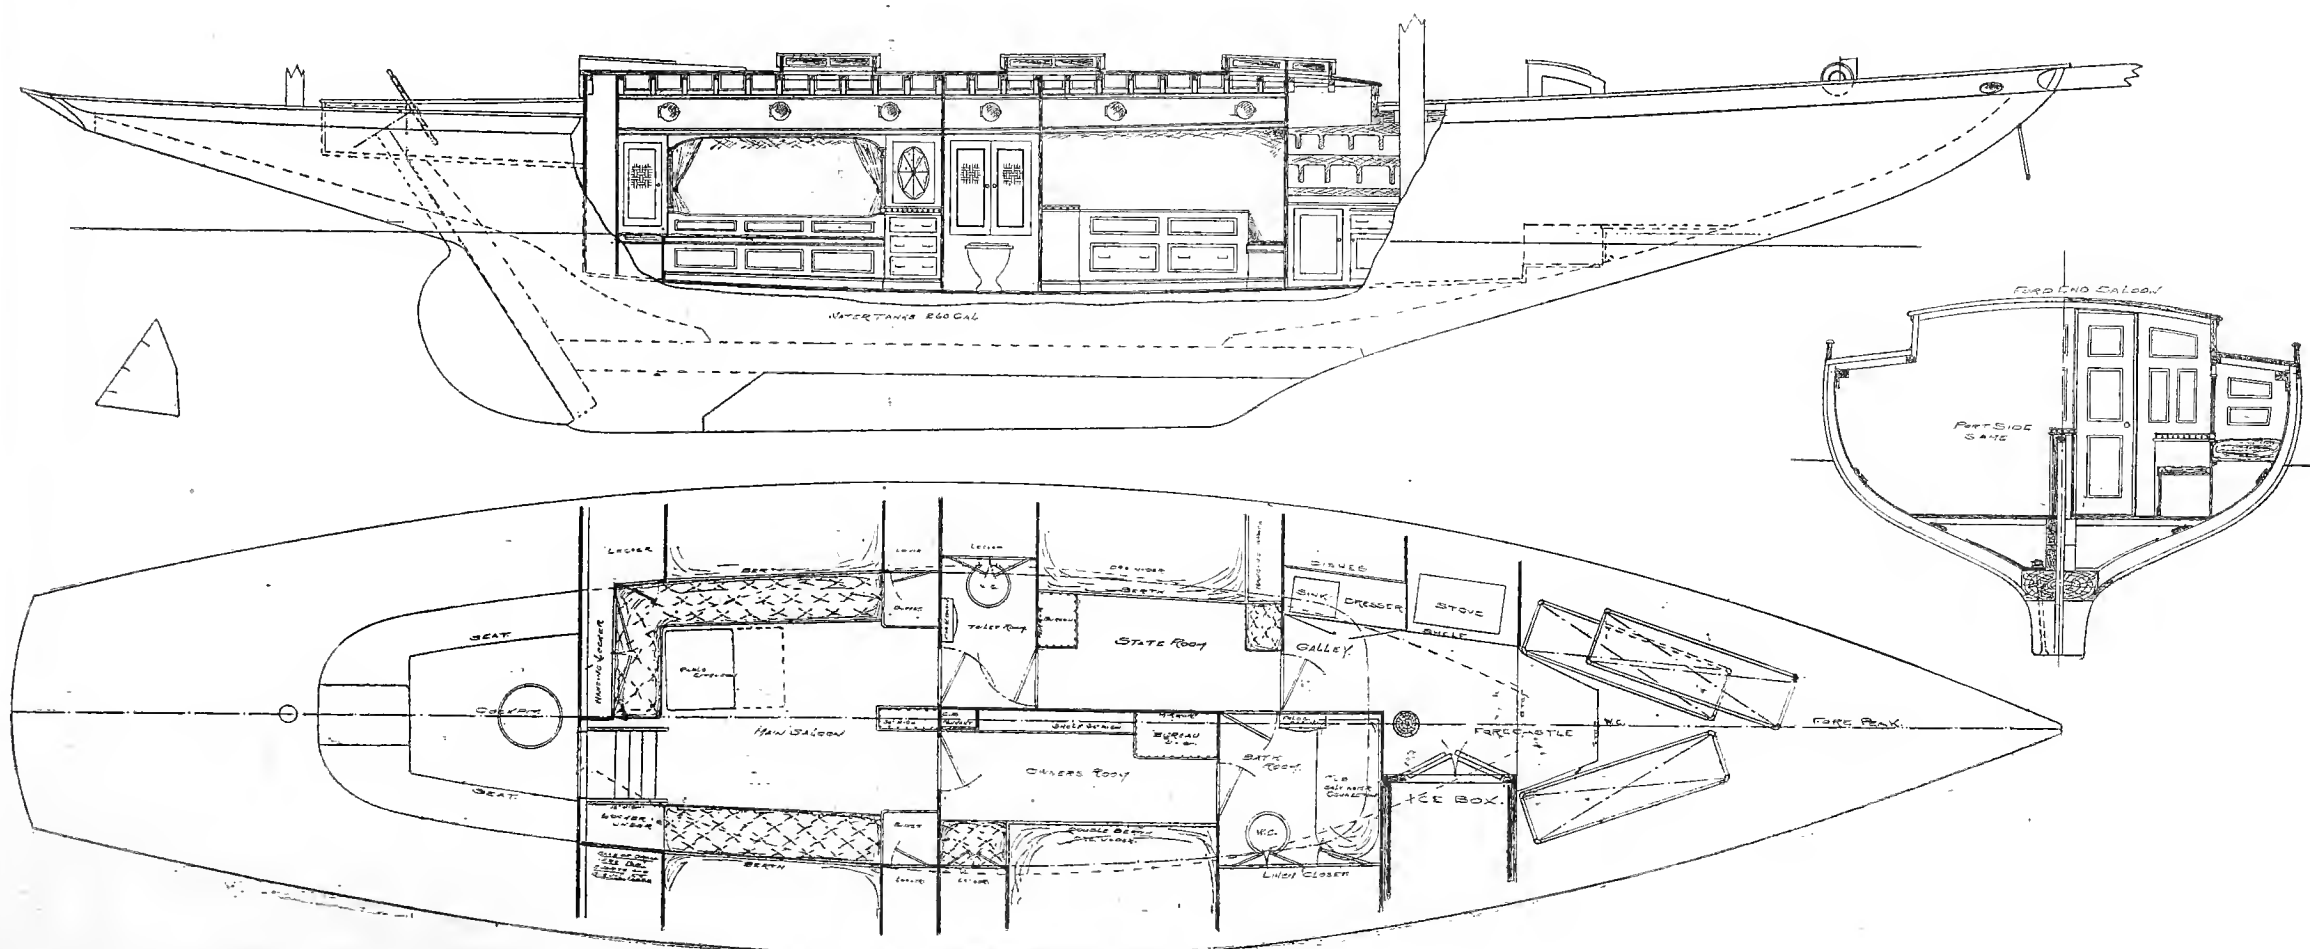

40ft. Waterline Cruiser.

DURING the next few weeks we will publish several of the designs that received honorable mention in the competition given last spring by this paper for a 40ft. waterline centerboard cruiser. In this issue there appears the design submitted by Mr. Morgan Barney, of New York city. This designer's work has found its way into these pages before, but we think more highly of this boat than any of Mr. Morgan's previous productions.

This boat would make a fine all-round cruising craft under either the yawl or the sloop rig. She has much room below decks. The cabin plans show the arrangement so clearly that no description is necessary. The dimensions follow:

Length—	Over all	61ft. 8in.
	L.W.L.	40ft.
Overhang—	Forward	9ft. 8in.
	Aft	12ft.
Breadth—	Extreme	14ft. 6in.
	L.W.L.	13ft. 10in.
Draft—	Without board	6ft.
	With board	13ft.
Freeboard—	Forward	5ft. 4in.
	Least	3ft. 5in.
	Aft	4ft.

STEAM YACHT FOR ALFRED MARSHALL.—Work has commenced at Morris Heights on a new steam yacht for Mr. Alfred Marshall, owner of *Levanter*. The new boat is of composite construction, and is 131ft. over all, 109ft. waterline, 17ft. breadth, and 6ft. 5in. draft. The boat will have a flush deck and two deck houses. The owner's quarters will be comfortably fitted up, as the boat will be used solely for cruising. The builders guarantee a speed of 16 miles.

LINES, CABIN AND SAIL PLANS OF FORTY-FOOT WATERLINE CENTERBOARD CRUISER.
Designed by Morgan Barney, New York City. Honorable Mention Design.

Gas Engines and Launches.

(Continued from page 381.)

BY F. K. GRAIN.

Gasolene.

In producing the gas for marine work we employ gasolene or naphtha, both being one and practically the same article. Most gasolene engines are rated at a certain break H. P. when using 72 to 74 degree gasolene. It is, however, now almost impossible to buy gasolene which will test over 68 degrees. While this gasolene works very satisfactorily, particularly in the larger engines, it will not of course develop the power of a higher grade. Gasolene, like all hydro-carbon liquids, deteriorates quite rapidly by evaporation. The more volatile parts of the liquids evaporate and leave the heavier oils, which will settle at the bottom of the tank, and where a float feed vaporizer is used this liquid may be found in the vaporizer or at the lowest point of the feed in considerable quantities, if the plant is laying idle for any length of time. The method employed in separating gasolene in the process of distillation allows of its absorbing more or less water, this also being heavier than oil, will settle at the lowest point.

We often hear of parties complaining of having trouble to start their engine after it has lain idle for a time, and in many cases it is owing to this very trouble of water coming first to the vaporizer, which of course will produce no power. We would advise in every case that the gasolene when put into the tank should be thoroughly strained through a piece of cheese cloth or light material, as small particles of wood from the barrel or tank are liable to eventually find their way to the vaporizer, and the cloth will also absorb much of the water in the gasolene. While on the subject of gasolene, while it is universally recognized as being a very dangerous agent owing to its high explosive qualities, it is perfectly safe if properly handled; and there has never been an accident of any kind that has not been traced to the most flagrant carelessness. It must at all times be remembered that this gas is of greater specific gravity than the atmosphere, therefore the gas will seek the lowest level possible. In filling a tank under the deck, the gas which arises from the tank will not come above the deck but will creep down around the tank into the bilge of the vessel and will remain there until gradually absorbed by the atmosphere, therefore all openings to tanks should lead directly up, through and above the deck. There is no danger of an explosion from any receptacle that is entirely filled with gasolene, the danger being entirely in the tank when emptied, which, in that case, would be full of gas. Never attempt to put out a fire of gasolene with water, as it will only add to the trouble; flour, sand and earth will smother the most vicious gasolene fire.

Troubles in General.

The troubles encountered in operating marine gasolene engines are so varied that, at times, it seems as if the users of these engines made special effort to induce their machines to do all kinds of tricks that even the majority of manufacturers have never encountered. The writer, occupying a position where these troubles and tricks are continually coming home to him in the form of letters of inquiry, we will endeavor to take these questions asked and, with the replies to same, obtain a sort of encyclopedia for the man of the perfume boat.

Supposing now that you are all ready to start out and, on going through the usual operations, your engine refuses to start. We will then first remove the wire from the electrode, then, be sure that the switch is on, take the wire and wipe it on some dry part of the engine. This will show if your batteries are working; and you can determine by the size of the spark whether it is sufficient for the requirement. Finding that this is all right, we then wipe the wire on the contact binding-post of the electrode, first being sure that the contact points are separated. In this case there should be no spark on the binding-post of the electrode. Should it, however, spark here, it will show that the plug or electrode is short-circuited. Now if the electrode is short-circuited it can be from only two reasons; one, that the mica or other insulation used is broken or burnt out, or that there is a coating of oil or soot covering the inside insulation, producing a short-circuit. Of course in either case the remedy is, in the first instance, to put in new mica insulations. If these are not at hand asbestos can be used as a makeshift.

While asbestos is a fairly good non-conductor on primary circuits, it of course will not answer on the high pressure of the jump spark. In case of soot and oil on the plug, clean thoroughly with gasolene, scraping the edge of the insulation with a pocket knife. The electrode can then be held against any bright part of the engine and tested before putting in place.

Another cause of sparking failures is corrosion on the terminals; also, at time a wire will break and of course cannot be seen through the insulation. This is sometimes very troublesome, as the vibration of the boat and movement of the wire will cause it to make and break its circuit. One very common trouble is the loosening of the connecting between the batteries. On examination a casual look will show everything in good condition, but if care is taken to try each binding-post, the owner will often be surprised to find a number of connections broken.

HEMPSTEAD BAY Y. C. MEETING.—At a meeting of the Hempstead Bay Y. C., held at Freeport, L. I., a few days ago, the following officers were elected: Com., Floyd Weekes; Vice-Com., Isaac R. De Nyse; Rear-Com., Joseph Rollins; Meas., William R. Clowes; Sec'y, E. J. Mortimer; Treas., Carman R. Lush; Governors—John A. White, Rowland H. Mayland, Isaac N. Carman, Israel W. Williams. The following committees were appointed for the year: Regatta, De Witt C. Titus, Robert W. Nix, George A. Weekes; House, Alanson Abrams, De Witt C. Titus, James Dean; Finance, Bergen R. Carman, Seaman L. Pettitt, M. H. Tracy.

The Paris Sailing Club.

Cercle de la Voile, de Paris.

BY A. GLANDAZ, BOARD OF DIRECTORS, CERCLE DE LA VIOLE DE PARIS.

PARIS is one of the most active of the French yachting centers. The Seine and its tributaries, the Marne and the Oise rivers, both above and below the capital, are admirably adapted for small boat sailing and motor boat racing. Ever since yachting has gained a foothold in France, these rivers have become the favorite sailing grounds for Parisians.

There are a number of yacht clubs in the vicinity of Paris, but the most active and influential, as well as the oldest, is the Cercle de la Voile de Paris. The Cercle was founded in 1867. Its by-laws were drafted in 1868. About eighty gentlemen acted as charter members, and its Paris home, which was first established at No. 4 Rue des Petits-Champs, was afterward removed to No. 4 Impasse d'Amsterdam.

In 1875 the Cercle de la Voile assumed its final name, which it has kept up since and became the Cercle de la Voile de Paris. It called itself, "Société de Navigation de Plaisance à la Voile, Fluviale et Maritime" (Society of Pleasure Sailing on Rivers and the Sea). In 1876 it broadened its scope and added a branch for power-driven yachts. Then the Cercle numbered 110 members. In 1877 a new standard tonnage rule was established. Yachts over six tons were accepted in the large class, under six tons in the medium class and under four tons in the small class. A measurement formula was also adopted, which was as follows:

$$T = \frac{L \times B \sqrt{L \times B}}{1000 \sqrt{M}}$$

L, for length; B, for breadth.

A very complete racing signal system was also adopted in 1879. In that year the two-ton class was created, and 1880 the class under two tons was added.

Owing to the persevering efforts of its officers and the spirit of responsibility inspiring its members, the club established more convenient quarters at No. 11 Rue St. Lazare.

In order to bring together the members during the long evenings of winter, when the bad weather kept them indoors, lectures were started. These were very successful and consisted of technical courses and anecdotal talks. A library was started, and this grew so much, that to-day it contains many maritime works of the greatest value.

At the Paris Exhibition of 1878 the Cercle was awarded a bronze medal. It was the only nautical society so honored, and the medal was an acknowledgment of its activity and a recognition of the success of its fall regattas, which had been well attended in that memorable year, when twenty-six sailing vessels and eleven steamers contested in the races of October 6, the day of the great Nautical Festival.

In 1881 the Secretary of the Navy conferred a new distinction on the Cercle, by registering the pennants of its yachts in the International Signal Code and recognizing its club flag. Many boats were added to the club fleet. The three-ton class and the five-ton class made their appearance. In 1890 the Cercle created the 30-metre sail area class. Among the successful boats built for this class were Buffalo, Darling and Moucheron. In 1892 a new measurement rule was adopted.

The Argenteuil Basin, where the club's first failures and first successes had taken place, had to be abandoned. The building of a railway bridge made it useless as a sailing place, and the Cercle emigrated to Meulan, in the Mureaux community, in the Department of Seine-et-Oise, some distance further down the Seine.

The Meulan Basin was better adapted to the club's requirements than was the Argenteuil Basin. It covers 8 kilometers, is 300 meters long and 350 meters wide. In 1874 a piece of land was bought on the shore and a club house was built. This building was opened on May 14, 1894, Admiral Baron Lagé, President of the French Yachting Union, presiding, and the inauguration was properly celebrated.

Shipyards have been established near the club house at Meulan comprising every facility for the building, equipment and maintenance of yachts. The plant answers every requirement, so much so, that Meulan has not only become the regular meeting point for the members, but the river regattas are also held there. It is at present the anchorage for a great number of yachts, and many of them lay up for the winter there in the little arm of the river.

While the Society holds its spring and fall regattas at Meulan, it has established for the summer several racing days at Trouville, on the coast. Cash prizes and medals are given in these regattas. Large subventions by the Yacht Club of France contribute to the number and value of the prizes, though the regular resources of the Society are amply sufficient, particularly when supplemented by gifts from certain members. Fine cups have been offered, and competition for these is very keen. The International Cup for one-tonners is the most important of the trophies, and it was first contested for in 1898. The cup was first raced for in the waters of Meulan in 1899. Belouga beat Vectis, the champion of the Island Sailing Club, and Sidi-Fekkar won out in 1900, beating Scotia, of the Royal Temple Y. C. In 1901, a challenge was received from the Italians. They sent the Dai-Dai III., but the English Scotia II. was victorious this time, and she took the cup across the channel. In 1902 the first attempt of the Cercle to win the cup back was unsuccessful, and August was beaten at Cowes by the English champion. In 1902 through the victory of Chocolat at Seaview the cup was brought back to France.

The Cercle takes the greatest interest in international contests. In 1902 the club sent Meulan to Kiel, which boat contested in the Sonderklasse (special class) for the cup presented by the German Emperor, and distinguished herself by coming out at the head of the foreign racers.

The Cercle was charged with the organization of the river regattas in the Exhibition of 1900, and it gave four days' racing, in which 55,000 francs were distributed

in prizes. Sixty-seven boats were divided in six classes, and a race of honor for the prize of the President of the Republic was included. This was won by the English yacht, Scotia. The second class, for yachts of ½ to 1 ton was for the International Exhibition Cup, and Scotia took this prize also. The purpose of the races was fully attained. The yachts bore that international character which the commissioners had in view. Yachts of every nationality—English, German, American, Dutch—participated and mixed with those from Paris and France.

The Society is now prosperous. The number of members grows continually; the club has more than 200 active members. The number of yachts flying the club's pennant is about 150, with a total tonnage of several thousand.

The club's flag is white with red angles, and a blue star in the center. Blue or white points distinguish the pennants of the president and board of directors, honorary or active.

The officers of the Cercle follow: President, Mr. G. Pottier; Vice-Presidents, Mr. E. Laverne, Mr. J. Valton; Secretary, Mr. Jacques Baudrier; Racing Secretary, Mr. Le Bret; Treasurer, Mr. Doucet; Board of Directors—Messrs. Charlot, Dubois, Glandaz, Jean-Fontaine, Jouet-Pastré, Marcel Méran, Paul Meurgey, H. Monnot, Potheau, Jacques Thierry, Susse, Vilamitjana.

The Cercle gives three events each year, spring and fall races at Meulan (with weekly regattas as well), and it holds several days' racing at Trouville in August. The anniversary of the Cercle is celebrated in May.

The measurement rule now in force is the one adopted by the Congress of Nautical Societies in 1899. The formula follows:

$$T = \frac{(L - \frac{P}{4})^2 P S}{1000 \sqrt{M}}$$

P, perimeter; L, length; S, sail area; M, surface of the under water body.

The measurement rule has given satisfaction, and the influence of the C. V. P. as a nautical society can best be judged by the fact that its rules have been adopted almost universally by the river societies.

The Cercle has recently created two new one-design and restricted classes which are independent of the general classes.

We have spoken of the International Cup, and have mentioned the successive victors. As to regulations it may be well to state that the challenges can only be taken by foreign societies of standing and of another nationality than the holder of the cup. Only one challenge from each nation and only one challenger from each society are allowed. The racing rules are those of the Cercle. The contests can be raced only at Meulan, Cowes, Antwerp, Amsterdam, Copenhagen, Barcelona, Lisbon, Genoa, Geneva, Pola, Kiel, Stockholm and St. Petersburg. Any club wishing to race for the cup, but whose nationality does not correspond to any of the cities named, will have to determine the place of contest by previous agreement.

The cup belongs to the 1-tonner class, and from 1904 on it will be raced for by yachts entering in the new restricted class. The crew must be composed exclusively of three amateurs. The course must be about 10 to 12 miles. Challenges must be issued before Nov. 30 for the races to take place the following year from May 1 to Sept. 1.

Among the other important cups mention may be made of the National Cup of the River Societies, also reserved to the 1-tonners of French build; the Pierre Nottin Cup for yachts of any tonnage, of French societies and named by amateurs only; the R. Linzeler Cup, which is raced for at Trouville by yachts from 1 to 3 tons; the Ed. Mantois Cup, for the class of 1 to 2½ tons, belonging to members of the Cercle; the Andree International Cup, open to yachts from 1 to 5 tons, providing the helmsman is an amateur; the Steamer Cup is now set aside for automobile boats; finally the Coupe des Adhérents, recently created.

The Cercle has played a most important part in the evolution of yachting in France, owing to the number of its members, who have always shown interest in the progress of racing yacht building and who have not only built yachts, but very often designed their boats.

A painter of talent, M. Caillebotte, was one of the first French amateurs to design yachts; he had several built and gained considerable experience.

At the same time and later another member of the Cercle, M. Gindicelli, designed several excellent boats that proved to be light weather craft. He visited the United States several times, getting information regarding the designs of American yachts, which ideas he embodied in the boats designed for river sailing.

Among the present members of the Cercle is Mr. Godinet, an amateur designer, who turned out the boat which beat in 1903 at Sea View her English contestant, Iris, that was designed by the late Arthur Payne. Mr. Godinet has also designed a number of yachts, notably two champions for the Coupe de France.

We must also mention the vice-president of the Cercle, Mr. E. Laverne, whose boat, the Sidi-Fekkar, built on the American scow model, beat in 1900 Linton Hope's celebrated yacht, Scotia I.

Among these amateur naval architects is Mr. M. Méran, who in 1899 had adopted by the Congress of Nautical Societies of France a measuring system conceived by him, which has become the French standard. By taking into the formula the factor covering the displacement of yachts, he made the first step in the direction which has since been followed by the New York Y. C. in its present formula.

We have given above a short summary of the past and present, the work and the traditions, the influence and the prosperity of the Cercle de la Voile de Paris. For the future we may look to the esprit de corps which pervades the Cercle; this is the thorough spirit of progress, work, emulation and solidarity.

All communications intended for FOREST AND STREAM should always be addressed to the Forest and Stream Publishing Co., New York, and not to any individual connected with the paper.

HOME OF THE PARIS SAILING CLUB AND COURSES ON THE SEINE.

Rhode Island Letter.

PROVIDENCE, R. I., Oct. 15.—A new automobile boat, built at the Herreshoff shops at Bristol for Mr. Frank Croker, of New York, was launched yesterday, and was given a highly satisfactory speed test in Bristol harbor in the afternoon, developing a gait of $27\frac{1}{2}$ miles an hour. In this preliminary trial there was much to induce the designer and the owner to believe that under more favorable conditions the boat may be brought up to a speed of 30 miles an hour. This is the first genuine auto boat built by the Herreshoffs. The new craft, which has not yet been named, is of handsome model, 45ft. long, a trifle over 5ft. beam, and of very shallow draft. The bow has a slight overhang, and the stern outline is broad and somewhat like the stern of the latest 15ft. racing sloops. The 90 horse-power Mercedes engine is set slightly forward of the midship section, and is protected forward by a turtle-back structure extending to the stem. She has a smooth, double planking of mahogany, finished bright. Mr. Croker is to take the boat to Florida this winter.

Mr. James A. Garland, of the New York Y. C., and owner of the steam yacht *Barracouta*, has purchased two farms of about 750 acres, situated at the northerly end of

Prudence Island, in Narragansett Bay. The transfer is of particular interest to local yachtsmen, as the land conveyed includes the neck that forms Potter's Cove, a favorite rendezvous with the yachtsmen of Narragansett Bay, and where the Rhode Island Y. C. has a station. These farms have been in the possession of the Brown, Ives, Gammell, and Goddard families since Revolutionary days, Nicholas Brown, the founder of Brown University, being the original owner. By the purchase of the land Mr. Garland will control the shores of Potter's Cove, which will afford him the yachting facilities he has been seeking, and he intends to erect a summer residence. What effect the disposition of the property will have on the future of yachting at Potter's Cove, and especially on the maintenance of the Rhode Island Y. C. station, is a question in which a large number of local yachtsmen are greatly interested.

Mr. Robert L. Greene, of this city, has purchased a power yacht called *Melba* from parties in Boston, and the craft has just been brought around the Cape to her new port. *Melba* is 44ft. over all, 9ft. beam, and 32in. draft. She is fitted with a 10 horse-power Murray & Tregurtha engine, and has a cruising speed of about 8 knots an hour.

F. H. YOUNG.

Boston Letter.

Boston, Oct. 17.—During the past season a series of special club races given by the Boston Y. C. was sailed off the Hull station of the club. The races were apart from the regular open and club championship races, it being the intention of providing steady competition between the yachts which remain at Hull throughout each season and for those not regularly provided for in races given by other clubs. Cups for 18-footers were offered by Mr. George H. Wightman, and in the first and second handicap classes by Mr. Alfred Douglass. Napier and Dorchen won the Wightman cups in the 18ft. class, Jingo won the Douglass cup in the second handicap class. In the following table of percentages it is assumed that a yacht has started in not less than four of the six races scheduled:

18ft. Knockabouts.			
	Starts.	Per Cent.	
Napier, B. S. Permar.....	4	82.6	
Dorchen, A. W. Finlay.....	4	76	
Aladdin, G. P. Keith.....	3	58.3	
Bonito, G. H. Wightman.....	5	54.1	
Gertrude, H. E. Lynch.....	4	47.2	
Humbog, C. W. Cole.....	4	42.3	
Nicknack, E. B. Holmes.....	4	36.8	
Bat, C. F. Adams 2d.....	1	25.0	
Mirage II., J. W. Olmstead.....	3	23.7	
Again, L. B. Goodspeed.....	1	21.8	
Biza, Alfred Douglass.....	1	11.1	
First Handicap Class.			
Jingo, G. B. Doane.....	4	65.8	
L'Aiglon, E. W. Hodgson.....	3	54.1	
Mildred II., S. P. Moses.....	3	50.0	
Kit, H. B. Whittier.....	1	25.0	
Opah, W. C. Lewis.....	1	15.0	
Kinna, A. W. Larnard.....	1	10.0	
Idella, B. D. Amsden.....	1	5.0	
Second Handicap Class.			
Mildred, C. A. Coleman.....	4	86.6	
Scapegoat, W. P. Keyes.....	5	73.0	
Jacobin, J. W. King.....	2	41.6	
Clarita, Walter Burgess.....	1	25.0	
Anne, C. R. Pratt.....	2	23.3	
Gadfly, C. W. Chapin.....	1	12.5	
Azara, G. E. Hills.....	1	8.3	
Clarice, J. F. Harvey.....	1	6.2	
Minerva, Walter Shaw.....	1	5.0	

The following corrected summary of the squadron run of the Yacht Racing Association of Massachusetts from Hull to Marblehead on July 31 is submitted, in which several changes in the positions of yachts have been made, due to remeasurements:

Class C—30-footers.		Elapsed.
Chewink IV., F. C. Macomber.....	2	15 55
Wasaka, S. R. Anthony.....	2	16 55
Sanquoit, T. Lothrop, Jr.....	2	18 04
Class E—22-footers.		
Medric, H. H. White.....	2	22 10
Clotho, Cheney & Lanning.....	2	22 33
Peri II., George Lee.....	2	23 28
Warrior, S. C. Winsor.....	2	28 37
Tayac, W. H. Joyce.....	2	34 20
Opitsah V., S. H. & H. I. Foster.....	2	35 32
Class I—18-footers.		
Dorchen, A. W. Finlay.....	2	28 12
Hayseed, H. L. Bowden.....	2	41 32
Privateer II., Allen & Carlton.....	2	42 47
Aladdin, Keith Bros.....	2	44 22
Napier, B. S. Permar.....	2	49 47
Bonito, C. H. Wightman.....	2	53 00
Hugi, A. F. Chase.....	4	01 17
Fritter, W. C. Loring, Jr.....	3	07 55

The winners of prize cups are as follows: Class C, Chewink IV. and Wasaka; Class E, Medric and Clotho; Class I, Dorchon, Hayseed, Privateer II., and Aladdin; Class T, Vera II. and Windahdin; Dory Class, Pointer II. and Elizabeth F.; First Class Power Yachts, Palmetto, Narcissus and Solace; Second Class, Edith M. and San Toy; Third Class, Duett and Edith E.			
JOHN B. KILLEEN.			

Gravesend Bay Championships.

WHEN members of the yacht clubs on Grasevend Bay met early in the season to arrange a schedule of non-conflicting dates, certain races were designated to count on the class championships of the year. It was decided to award a pennant of little intrinsic value to the winners of the different honors which were to be competed for on a point system in which a yacht gets one for starting and finishing an event, and one for every competitor she defeats. This simple pooling of interests replaced the more compact Yacht Racing Association of Gravesend Bay, which had existed for three previous seasons.

Championship races of the year were held on June 25, under the auspices of the Brooklyn Y. C.; on July 16 by the Bensonhurst Y. C.; on July 30 by the Marine and Field Club, and on August 20 by the Atlantic Y. C. The closing event of the year took place on September 17 under the auspices of the New York Canoe Club; thirty-three different yachts entered the series, in which the winners of first honors were Bagheera, Lizana, Ogeemah, Beta, and Martha M. A tie resulted in class M between Maydic and Redwing, which is yet to be decided. Kelpie led the Marine and Field one-design boats, but championships were offered to regular classes only.

In the number of firsts won, Maydic leads in class M with 3; Bagheera and Bobtail are tied in class N with 2 each; Lizana heads the list in class P with 3; and Ogeemah occupies a like position in class Q with 4. In the new class R R of the Marine and Field Club, Beta holds the proud record of having won every championship race. Martha M leads the catboats, being beaten only once in five starts. The official records of the season of 1904 follow:

Sloops—Class M.			
Maydic, W. H. Childs.....	Starts.	Points.	
Redwing, J. B. O'Donohue.....	4	7	
Vivian II., S. E. Vernon.....	5	7	
	2	4	
Sloops—Class N.			
Bagheera, Hendon Chubb.....	4	9	
Era, E. H. M. Roehr.....	5	7

Southern Notes.

THE 1901 Canada's Cup 30-footer Cadillac has been sold to Mr. S. F. Heaslip, of New Orleans, by a Detroit syndicate. Last spring Commodore Heaslip purchased Calypso from Mr. A. W. Chesterton and brought her here, where she won the "Cock-o'-the-Walk" flag in her class in the Southern Gulf Coast Y. A. It is quite a coincidence that these two celebrated yachts, designed and built by Hanley at practically the same time, should now be owned by one man and at such a distance from Boston and Detroit, after they had so notably performed missions elsewhere.

The yachting season just closing was quite notable for the large number of sailing yachts brought from the North to augment the local fleet, the number of boats thus added to the roll number—almost a dozen—included, in addition to the three Boston boats before mentioned, Alpha Tau, Lucille I. and Lucille II. from Chesapeake Bay, and the fast racing machines, Caroline, Moki, and Kayoshk, from the ranks of the Inland Lakes Y. A. The purchase of these yachts did not start until early spring last season, and at this time last year there was little thought that so fine an array of pleasure boats would be brought here. These importations have opened the way for a new and better order of things in the yachting line for the South, and there is much indication that the good work now so well started will be continued until the Gulf coast has a fleet to be proud of.

L. D. SAMPSELL.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

WILLIAM V. HANSON DIES.—On October 14 William V. Hanson, a well known yacht and shipbuilder, died at his home in Brooklyn at the age of 85. He was an honorary member of the Atlantic Y. C.

SEAWANHAKA CUP CHALLENGE ACCEPTED.—The Executive Committee of the Royal St. Lawrence Y. C. held a meeting on the evening of October 14 and accepted the challenge filed by the Manchester Y. C. for the Seawanhaka Cup. The races will probably be held next August.

It will be remembered that the Manchester Y. C. representative, Kuluto, was defeated by Thorella II. in 1903.

SCHOONER FOR F. F. BREWSTER.—A short time ago the Geo. Lawley & Son Corp. closed a contract for the construction of a steel schooner for Mr. F. F. Brewster. The boat was designed by Messrs. A. Cary Smith & Ferris, and is 123ft. 6in. over all, 86ft. 6in. waterline, 25ft. breadth, and 15ft. 6in. draft. Mr. Brewster is the owner of Elmira, and he will race his new boat against Ingomar.

ENDYMION RUN DOWN BY TUG.—The schooner Endymion, owned by Mr. George Lauder, Jr., was run down by the tugboat Sallie, of Norfolk, while at anchor in Hampton Roads. The yacht was beached off Fort Wool on the flats to keep her from sinking. The day following she was towed to Newport News, where she was hauled out. She was leaking badly, and had a big hole in her bottom. Repairs will be made at Newport News.

Canoeing.

High Island Canoe Camp.

BY GUY E. MITCHELL.

ALMOST within rifle shot of the outskirts of Washington, but as secluded as though twenty miles distant, lies the High Island Canoe Camp, located on the crest of High Island, rising out of the Potomac and overlooking its Little Falls. Although an ideal camp site, High Island was for years looked upon as an inaccessible camping spot. It rises precipitately out of the broad bottom of the Potomac some eighty-five feet,

SUMMER SCENE AT HIGH ISLAND.

and until the High Islanders undertook to conquer its prohibitive climb, it was shunned by campers and picnic parties and never visited except by exploring naturalists. Four summers ago seven enthusiastic canoeists determined that the knob of High Island should form their permanent camp site, summer and winter. They constructed a rope railing to assist in the seemingly almost perpendicular climb, and the first year saw two sleeping tents and a cooking fly occupied until the snow fall of November. But plans had already been made for a camp house, and the following year

CAMP HOUSE OF THE HIGH ISLAND CANOE CLUB.

building was commenced. Additions have been made, until now the house boasts two stories with sleeping accommodations for ten men, a commodious kitchen and double piazzas on two sides. No week in the coldest winter weather has gone by since the shingles were nailed down that the smoke, issuing from the ample stone chimney, has not attested to the roaring open fire of oak and hickory inside, and of late supplemented by the heat from a substantial cooking range. In summer gasoline is substituted as a cooking fuel.

The house and improvements of the island are a not insignificant monument to the energy and industry of the canoeists. Every stick and stone has been carried to its destination on the shoulders of the boys. The steps climbed, even empty-handed, will impress the visitor with the tremendous magnitude of the work. Not the smallest particle of labor has been hired, nor

are any of the members of the club men of leisure. Even the stones for the chimney and big fire-place were collected along the flats of the Potomac in rowboats and carried up the steep island side.

The camp now has a permanent lease of the island, the high portion of which does not cover probably more than three or four acres. The property is owned by a Philadelphia syndicate which contemplates its use in the erection of an enormous power dam, with some sixty feet fall, which will form a gigantic storage reservoir ten or twelve miles in length. The High Island Camp, however, has not slackened its improvements in the fear that this project will soon spoil the island as a camp site, since the undertaking has large engineering difficulties to overcome, as well as to secure the consent of Congress to the construction of such a work, which might well be looked upon as a possible menace to the safety of Washington, since the great dam might go out during some of the terrific floods which sweep down the Potomac.

Well wooded on the crest with white and black oaks, hickory and ash, and surrounded with the softer woods—sycamore, tulip, sassafras, cedar, etc.—the camp site, while well shaded, enjoys any of the breezes which may be blowing up or down the Potomac. While it is sufficiently high to be free from possible miasma, found upon the alluvial bottoms, it is also free from flies and mosquitoes.

The present summer camp consists of six tents in addition to the camp house. The canoe landing is on what is known as the "feeder" of the Chesapeake and Ohio Canal, through which the water always races at three to four miles an hour. From this landing the camp path winds through the dense shade of a hundred yards of bottom land, crosses a couple of rustic bridges and merges into the steps ascending the island hog-back.

The camp boasts at least one strong man, who holds the record for carrying up the steep steps a fire-place rock weighing 250 pounds, although two other of the boys succeeded in negotiating the heavy kitchen range up the same route.

Botanically, the island is known far and wide. The plant scientists of the Department of Agriculture state that a dozen or more herbaceous plants are found along its lower slopes which occur in no other locality near Washington, and are, in fact, of extreme rarity elsewhere. Seeds of plants have apparently been washed down the river from far western points and have found a lodgment upon High Island, their extreme eastern habitat.

The single real hardship which devolves upon the camp is the securing of their drinking water, but this is about to be overcome. At present the water must be carried from a spring some distance up on the Maryland shore, and fifty or more feet above the river level. The Islanders are arranging to pipe the water from this spring, across the canal and the feeder, and by gravity pressure convey it up the side of the island to where an ordinary suction pump will force it directly into the kitchen, the highest point on High Island.

A five-mile trip from the Washington boat-houses, several of the members regularly paddle to and from their office work, while others walk half a mile to the electric cars which traverse the Maryland shore above the Potomac. Every Saturday night sees a throng of members and visitors to the camp to spend a night in the woods and enjoy a cool and quiet Sunday.

Rifle Range and Gallery.

Fixtures.

Nov. 8.—Greenville, N. J.—Annual 100-shot championship at Armbruster's Park.

National Rifle Association.

WASHINGTON, D. C.—In connection with the meeting of the National Board for the Promotion of Rifle Practice on Saturday next, to consider prospective legislation for the encouragement of military rifle and pistol practice, the board of directors of the National Rifle Association will meet here Saturday evening, Oct. 22, at the Arlington Hotel. At the last annual meeting of the Association at Sea Girt, N. J., it was proposed to make the Association a governing body of federated military and civilian associations and clubs devoted to rifle and revolver shooting, and it was recommended that the annual membership be abolished and the rights and privileges now given to such members be extended to all members of affiliated organizations. It was also recommended that the present annual members be given the privilege of taking out a life membership, and having credited against the cost of the same the amount of dues paid on account of annual membership. It is proposed that in the future the annual directors shall be elected by delegates from the affiliated clubs.

The board of directors will pass upon these recommendations and also consider the character of legislation to be presented to Congress at the coming session.

Manhattan Rifle and Revolver Association, N. Y.

THIS well-known organization held its regular practice shoot at the Greenville, N. J., range on Saturday, Oct. 8. B. F. Wilder ran a string of 100 shots with the revolver, averaging over 90, while several of the members devoted the afternoon to the 200yd. rifle range. Scores follow:

Fifty-yard, revolver: B. F. Wilder 90, 91, 94, 89, 89, 92, 92, 91, 92, 89; total 909. J. E. Silliman 80, 88, 90, 87, 86, 84; J. A. Dietz 84; W. J. Coons 77, 78, 81, 88; C. F. Davis 87, 85, 90, 91, 84, 83, 89, 87; H. H. Brinckerhoff 73, 67, 81, 69.

Two hundred yard, rifle: Dr. W. G. Hudson 219, 229, 229, 229; W. J. Coons 197; W. A. Barker 229, 220, 228, 227, 236; L. P. Hansen 217, 221, 214; H. F. Barning 219.

Miller Rifle Club.

HOBOKEN, N. J.—The following scores were made in the gallery, 75ft. offhand, on the 25-ring target, P. J. O'Hare, the expert military marksman, being high man with the score of 247: P. J. O'Hare 247, C. Bischoff 245, H. Bahn 243, R. Goldwaithe 243, D. Dingman 242, D. Miller 239, O. Smith 237, O. Burquest 236, F. Emme 235, R. W. Evans 234, A. Schwartz 232, C. E. Doyle 232, C. Hussel 231, P. Neuner 230.

Massachusetts Rifle Association.

SCORES follow for the regular weekly shoot. While the weather conditions were not of the best, a good number of entries were made in all the matches.

Members' offhand match: R. L. Dale 91, T. Carlson 88, F. C. Fitz 82, F. H. West 78, S. C. Sampson 77, M. T. Day 76, J. B. Hobbs 74, A. W. Hill 71.

Military offhand match: T. Anderton 48, R. S. Hole 46, T. Atkins 44, M. T. Day 43, A. W. Hill 43, S. D. Martin 42, J. B. Hobbs 42, O. Moore 42.

Military revolver match: E. B. Hawkes 49, W. A. Smith 46, A. W. Hill 45, J. B. Hobbs 45, O. Howe 44, S. D. Martin 44.

N. R. A. medal match: Conditions: Military rifles, 7 shots at 200, 300 and 500yds.: R. S. Hale, 200yds., 22; 300yds., 22; 500yds., 22; total 66. T. Anderton, 200yds., 23; 300yds., 21; 500yds., 21; total 65. R. L. Dale, 200yds., 20; 300yds., 23; 500yds., 21; total 64.

Long range match, 1000yds.: F. Daniels 48, M. T. Day 39, O. Moore 30.

Rifle Notes.

There is a movement on foot through the Western States toward the formation of a Pacific Coast Shooting Bund. At a meeting held recently at Odeon Hall, San Francisco, Cal., communications were read from various quarters of the State, tendering their mutual support toward the new organization. Delegates were appointed as follows: Shell Mound Pistol and Rifle Club, H. P. Nelson, A. M. Paulson, H. Windmuller; California Schuetzen Club, F. Levers, T. J. Carroll, A. Rahwyler; Pacific Indoor Club, Max Kolander, J. Kytka, F. V. Kington; Golden Gate Club, W. F. Blasse, B. P. Jonas, G. E. Frahm; Turner Shooting Section, Chas. Peach, D. Davidson, Jos. Straub; Sacramento-Helvetia Club, Capt. F. Ruhstaller, J. Meyer, J. Gruhler; Independent Rifles, C. Andrews, H. Gootjen, C. Iverson.

The Zettler Club start their gallery contest on Tuesday of this week, closely followed by the New York Central Schuetzen Corps. The N. Y. Independent Corps will meet on the second and fourth Thursday of each month. N. Y. Schuetzen, second and fourth Friday; Italian Rifle Club every Monday; Zettler Rifle Club, every Tuesday; N. Y. City Schuetzen Corps, first and third Thursday; N. Y. Central Schuetzen Corps, first and third Wednesday; Lady Zettler Rifle Club on the last Saturday of each month.

Trapshooting.

If you want your shoot to be announced here send a notice like the following:

Fixtures.

Oct. 20.—Poughkeepsie, N. Y., Gun Club fall tournament.
Oct. 25-26.—The Plumsteadville, Pa., target tournament. N. L. Clark, Sec'y.
Oct. 26.—Concord, Staten Island.—All-day target shoot of the Mullerite Gun Club, on the grounds of the Richmond Gun Club. A. A. Schoverling, Mgr.
Oct. 26-28.—Blackwell, Okla., Gun Club tournament. Chas. Cornelius, Mgr.
Nov. 1-3.—St. Louis Mo.—World's Fair shoot; live birds and targets. Alec D. Mermod, Mgr., 620 Locust street.
Nov. 8.—Bound Brook, N. J., Gun Club all-day shoot; merchandise prizes. F. K. Stelle, Sec'y.
Nov. 17-19.—Tampa, Fla.—Tampa Bay Rod and Gun Club, \$400 added. J. A. Hansbrough, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have published. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York. FOREST AND STREAM goes to press on TUESDAY OF EACH WEEK.

The team race, between the Poughkeepsie and Ossining gun clubs will probably take place on the 29th inst., or some time near that date.

Mr. L. G. Schroeder, a new member in the shooting contingent of the New York Athletic Club, took the first win for the October cup in the contest for it last Saturday at Travers Island. With handicap allowance added he scored 46.

The test case of the Riverton Gun Club in respect to the status of the New Jersey law which prohibits all shooting of live birds at the traps, has legally commenced. The two members who shot on the grounds of the Riverton club, were indicted by the Burlington Grand Jury for violations of the law mentioned.

At the Dalton, O., Gun Club tournament, Oct. 6 and 7, Mr. R. O. Heikes was high in the professional averages. He broke 376 out of 400, a 94 per cent. performance. Mr. C. A. Young was second with 373. High amateur average, 369, was made by Mr. F. H. Snow. Mr. Heikes made the longest run, 77 straight. Mr. C. O. Le Compte ran 72.

The championship of Schuylkill county is still in abeyance, as the following press dispatch shows: "Mahanoy City, Pa., Oct. 8.—To decide the live-bird championship of Schuylkill county, and for a side bet of \$250, Peter Haverty, of Pottsville, and Nathan Benner, of this place, shot at 21 birds at Mahanoy City Park to-day, a tie resulting at 19 kills. Another match will be arranged for increased stakes."

At Marquette, Mich., the Ishpeming Rod and Gun Club recently was formed. Forty charter members were enrolled. Their object is to assist the game wardens in protecting the game and punishing offenders. The officers are as follows: President, Dr. A. Deadman; Vice-President, Louis Biegler; Secretary, Harold Trosvig; Treasurer, J. J. Johnson. There will be regular target practice and trapshooting in due time.

A correspondent writes us that the "U. M. C. Gun Club, of Guthrie, Okla., made a special shoot in honor of C. G. Spencer, of St. Louis, who is as a target marksman one of the best in the world. About fifteen shooters took part. H. J. Donnelly, of Guthrie, won high average with 93 per cent.; C. G. Spencer scored 92 per cent., and K. L. Eagan 91 per cent. Mr. Donnelly's friends are much pleased at his victory over the famous crack."

At Princeton, N. J., on Oct. 15, the University Gun Club team, in its first contest of this season, was defeated by the Trenton Gun Club, the scores being 118 to 111. Each man shot at 25 targets, and of the Princetons, Messrs. Frick and Gans were high with 23 and 22 respectively. Other contests of the University Gun Club are arranged as follows: Oct. 22, University of Pennsylvania, at Philadelphia; Nov. 5, University of Pennsylvania, at Princeton; Nov. 11, Yale, at Princeton; Nov. 12, intercollegiate shoot, at Princeton.

At the first tournament of the Mullerite Gun Club, to be held on the grounds of the Richmond Gun Club, at Concord, S. I., Oct. 26, a match has been arranged to take place at 11 o'clock between Mr. James Morrison, of the North River Gun Club, and an unknown, of the South Side Gun Club. The programme provides four events: one 10, two 20 and a special 100 target event, the Mullerite handicap. The totals are: Targets, 150, entrance \$6.85; added money \$28. Mr. Albert A. Schoverling is the manager. The club headquarters are at No. 2 Murray street, New York. Shooting begins at 10 o'clock.

A correspondent writes us that "the first fall tournament of the newly organized Delaware State League is to be held at Middletown, Del., Oct. 27 next. The plan is as follows: Several clubs in 'The Blue Hen's Chickens' State have organized themselves into a trapshooting league, and will hold semi-annual tournaments, one in the spring and one in the fall of every year. The principal events will be a 100-target race for the individual championship of the State, open to all residents of the State, and a State club five-man team race for the club team championship, manufacturers' representatives barred from competing on any team."

At the tournament of the Sistersville, W. Va., Gun Club, held on Oct. 12 and 13, the high averages for the two days, at a total of 400 targets, were as follows: First, R. L. Trimble, 380; second, W. A. Wiedebush, 378; third, C. W. Decker and Ed. O. Bower, 374; fourth, J. F. Mallory, 372; fifth, J. A. Penn, 368; sixth, C. J.

E. D. FULFORD.

Mowery, 367; seventh, L. J. Squier, 366; eighth, W. T. Nichols, 361. The straight runs made were as follows: L. Fisher 121, R. L. Trimble 87 and 55, W. A. Wiedebush 92 and 69, Ed. O. Bower 63 and 55. Mr. Bower managed the tournament in an expert and pleasing manner, attending to the complex responsibilities in a manner satisfactory to all.

BERNARD WATERS.

IN NEW JERSEY.

Lahlatang Gun Club.

HIGH BRIDGE, N. J., Oct. 12.—I inclose herewith trap score of monthly shoot of the Lahlatang Gun Club, of High Bridge, N. J., held on Saturday, Oct. 8. The event was the monthly shoot for a gold medal, which is contested for the second Saturday of each month, the member making the highest score out of a possible 25 holding the medal for the month.

We shoot from three traps at known angles, arranged according to the Sergeant system, having five men in a squad. The medal was won by A. H. Exton, secretary of the club.

Pattensburg Gun Club.

Pattensburg, N. J., Oct. 10.—Six of our boys shot a practice match to-day, in which they showed good form, considering the light practice they are having. They have not been so active this summer, but they seem to hold their own very well. We hope to see more of our members at our practice shoots and to arrange for a club shoot soon.

C. W. BONNELL, Sec'y.

Bound Brook Gun Club.

Bound Brook, N. J., Oct. 16.—The Bound Brook Gun Club held their first shoot for the three silver loving cups presented by the club. The attendance at this shoot was small. Only four of the members took part. The silver cups are to be shot for in one event of 25 targets, three high guns winning.

Mr. S. W. Dunning won first, Mr. B. Prugh came in second, and F. K. Stelle won third. The club has a medal for members living out of town, and any visiting shooter may take part in this event. This medal is to be shot for three months, and the one holding it the most times, all ties to be shot off on the third shoot becomes the permanent holder. Mr. Giles was fortunate to be the owner this month. Following are the scores:

Montclair Gun Club.

Montclair, N. J., Oct. 15.—Interest in the Saturday afternoon shoot of the club continues to be well maintained. Some fourteen men lined up at the traps to-day.

Messrs. Fanning and Butler were the guests of the club.

No very high scores were made, nor were there any records broken. Events Nos. 1 and 2 were for practice only. Events Nos. 3 and 4, 50 targets, applied on the match for the watch fob presented by Messrs. Schoverling & Welles, to be shot for during the month of October. No new record was made on this match, nor any new record for the silver loving cup.

EDWARD WINSLOW, Sec'y.

E. D. Fulford.

THE sad news comes to us that E. D. Fulford has passed away. He died on Saturday of last week at his home in Utica, N. Y., from an attack of pleuro-pneumonia.

He was in attendance at the shoot held at Williamsport, Pa., Sept. 20-22; and though feeling ill at the time, he continued in the competition with that conscientious earnestness which was a characteristic of him. The race for high average at that tournament was close between him and Messrs. L. J. Squier and J. M. Hawkins. They were a tie when the last event commenced, and each broke 20 straight and finished tied. After the shoot, being seriously ill, he returned to his home, where the fatal malady quickly and seriously developed.

As a trapshooter, he was one of the most famous and best. He had been identified with the trapshooting leaders as one of the ablest and most skillful. He was a contestant in many matches of national fame, and was many times victorious. About twelve years ago, when he first came into conspicuous public notice as an expert of marvelous skill, he chose as his opponents the seasoned experts, the victors of many contests, the champions of the shooting world. In a series of matches, he vanquished the famous trap shot, Mr. John L. Brewer, and also was successful in a series of contests with the redoubtable champion, Mr. J. A. R. Elliott. He shot numerous other great matches. In the list of his victories is the much-coveted Grand American Handicap, that of 1898. When he won that event, the friendly applause of the multitude was almost riotous, and foremost among those in extending their congratulations were his business competitors. Great as were his abilities in the use of a shotgun, they still were much greater than the popular estimate of them, for he was guileless in the deft ways of the press agent. He did his work well, and then left it for the world at large to judge of its value.

As an inventor, he also attained national fame. He made original improvements on the traps used in shotgun competition by developing them to a degree of perfection. He invented the Fulford single-trigger, a task which required the solution of one of the most difficult of mechanical problems, and which has balked the best efforts of the most skillful inventors. Other useful inventions are also to his credit.

At the time of his death he was a representative of the U. M. C. Co., and the Remington Arms Co. Many of his trade associates had arranged to attend his funeral. Messrs. Frank E. Butler and J. G. Heath, of the U. M. C. Co.; Mr. L. J. Squier, of the E. I. duPont Co.; Mr. J. S. Fanning, of the Laffin & Rand Co., are of the number.

In person, he was of graceful physique and fine presence. He was quiet and unassuming in his deportment and free from all manifestations of vanity, notwithstanding his many victories. His nature was straightforward and purely honest. No hidden craft masked his purposes. No enmity had a place in his nature. If maligned, he bore his grievance silently and without resentment. He was the embodiment of charity for all and malice toward none. In his favorite occupation, he never wearied. He delighted in giving information alike to the most humble or the highest of mankind. Patient, forbearing, honest and earnest, he attained honorable success and possessed the heartfelt esteem of all his fellows. In his life, the Golden Rule was honestly exemplified.

Freeport Gun Club.

FREEPORT, L. I., Oct. 15.—The Freeport Gun Club had their fall opening to-day. The main event was for a silver loving cup presented by Mr. Gus Greiff.

In that event the scores were as follows, with handicap allowance added: Rider (4) 41, Willis (4) 48, Simonson (6) 44, E. P. Smith (12) 45, Glover (scratch) 43, Ansell (10) 42, Greiff (scratch) 43, Welles (scratch) 44, Valentine (12) 49, Sutton (12) 40, Vosselman (10) 43, A. Smith (12) 50.

Several sweepstake events also were shot.

WESTERN TRAP.

Hall vs. Cadwallader.

LOAMI, Ill., Oct. 12.—W. H. Cadwallader, a trade representative traveling in Illinois, rolled in to the town where dwelleth one Tom Hall. As both were looking for a little practice, a match at 50 live birds, 25 each, was arranged. The result herewith shows that none lived to get away, although the sixteenth bird that came to Cad was a lively outgoing puzzler, with life enough to get beyond the boundary line. It was a hard race, though the birds were not above the average, yet the fast ones were puzzling.

Scores:
Cadwallader 222222222222222222222222—24
Hall 222222222222222222222222—25

At Dows, Ia.

Dows, Ia., Oct. 13.—The shoot held here yesterday was not patronized to the extent which justified holding same two days. Seven shot through the entire programme, three of whom were traveling men, viz.: Gilbert, who missed but 6 out of 200, and Chas. Budd and Fred Lord, neither of whom were in good form or quite at home in the strong cold wind that kept up throughout the entire day. Those for the trade present were Fred Whitney and Marshall Sharp.

For the amateurs, Russell Klein shot well, 178 out of 200. Henry Steege was well up with 172. Scores of those who shot through the programme of 200 targets:

F. Gilbert 194, R. Klein 178, H. Steege 172, C. W. Budd 162, L. M. Howell 156, J. Peterson 155, F. H. Lord 153.

At Crawfordsville.

Crawfordsville, Ind., Oct. 12.—The tournament held here the past two days, while not favored with the usual good crowds, the scores made were of the usual very high order. It is true that the conditions, such as comfortable club house, smooth grounds, finest of background, oiliest working traps, no friction anywhere in any way connected with the shoot, all go to make up a shoot where all shoot with pleasure, and scores are the "best ever."

Crosby did not duplicate his former score made here early in the season, but he lost only 3 out of 225. Riehl and Keck were present, and Frank made second professional average. Guy Burnside got rather gay, and his score of 435 out of 450 will not soon be excelled. Austin Flynn also shot well up. Scores:

	First Day.		Second Day.		Total.
	Shot at.	Broke.	Shot at.	Broke.	
Crosby	225	219	225	222	450

At Atchison.

Atchison, Kans., Oct. 10.—Last week was an eventful one among the trapshooters of Atchison and the West. It seemed like old times indeed to meet with Lou Erhardt and mingle with him while he managed a tournament for the Forest Park Gun Club.

While so many of the tournaments are having poor attendance it was a pleasure to note that our fifty shooters forsook club shooting and shot with the club for two days. With this full attendance still an unusual thing happened. Mr. J. Heath won both the high and low score for amateur, being the only one to shoot in every event. The only other two men to shoot through were Harold Money and Billy Heer. They were at their best, as they tied on 289. Harold made 147 out of 150 first day, and Billy gained 3 the second day and made a tie. Hon. Tom Marshall was surely shooting well, as he only missed 5 out of 120. He was compelled to depart for other fields of labor.

R. Dougherty and F. Dougherty, of Bean Lake, Mo., shot well, as they are in practice shooting ducks. Andy Fulton came out with a 14-gauge gun, and after using up his shells, tried other guns, with poor results. Everybody was delighted with the good time, and hope that Atchison and Lou (Airy) will hold at least two yearly tournaments. Scores follow show the number shot at and broke: W. H. Heer shot at 150, broke 144; D. Elliott 150, 136; G. W. Keller 60, 25; Utt 15, 7; J. Bilcock 15, 7; J. Fussillman 15, 9; P. Jacobson 105, 83; F. Tyson 105, 87; W. Berry 135, 124; D. Evans 15, 10; L. Moine 120, 97; F. Hager 15, 8; W. Burmauer 30, 20; F. Dougherty 120, 104; Oswald 45, 26; C. Finley 30, 22; Clapp 30, 29; R. Dougherty 120, 110; W. H. Lewis 60, 37; J. Small 15, 6; B. O. Running 90, 81; W. H. Baldwin 150, 120; W. G. Lytle 120, 100; J. E. Johnson 150, 131; H. Reece 135, 118; A. Fulton 150, 124; D. E. Ferguson 150, 117; Dunning 90, 66; Jas. Gray 150, 137; Thos. Highfill 90, 73; F. Schreiner 60, 41; B. Lyons 75, 67; Ratewan 60, 31; T. H. Clark 135, 105; C. Willis 60, 53; J. Leath 150, 116; Allen 60, 45; J. Keithleine 135, 96; Brinson 105, 84; W. H. McGee 150, 135; J. Schletzbaum 75, 44; Harold Money 150, 147; Tom Marshall 120, 115; H. Henderson 75, 69; H. Tipton 75, 65; D. Baker 15, 10; C. Maage 15, 5; J. Botkin 45, 32.

Second Day, Oct. 3.—Fulton shot at 90, broke 62; Leath 150, 117; Johnson 90, 76; Anderson 120, 107; Jacobson 105, 84; Reece 90, 69; Myers 105, 81; Schletzbaum 15, 11; Hawley 90, 69; O'Neil 60, 39; Money 150, 142; Heer 150, 145; Highfill 75, 55; Gray 135, 120; Cunningham 150, 132; Schreiner 135, 103; Baldwin 75, 63; F. Dougherty 150, 138; R. Dougherty 150, 132; Lou Ehrhart 75, 59; Lewis 60, 44; Kraal 15, 12; Lynde 30, 21; Clark 30, 24; Falconer 15, 3; Kramer 30, 15.

Spencer in Oklahoma.

Blackwell, Okla., Oct. 12.—The gun club here was pleased to welcome Chas. Spencer, the St. Louis expert trap shot and trade representative. It did not take long to get together a few of the enthusiasts, and all were entertained by Mr. Spencer with shotgun and fancy rifle shooting. He broke 100 targets straight. The race between Cornelius, Nate Pettit and W. S. Prettyman for the club medal is a close one. Scores of 48 out of 50 are often made.

All the club members are busy getting everything in shape for the Oct. 26, 27 and 28 tournament.

In Other Places.

The Matthews, Ind., Gun Club will hold a live-bird tournament Oct. 25 and 26. As live-bird shoots are seldom given, this will be of much interest to the Indiana trapshooting followers.

Mr. C. W. McMakin, of Battle Creek, Mich., while hunting, had the misfortune to shoot off one of his own fingers. He is a practical man, and congratulates himself that he escaped as well as he did. He reasoned that it might have been worse.

Saturday last there was a shoot at Kelly's place, which is across the upper free bridge at Peoria, Ill. The genial proprietor prepared a fish fry, which was set up free during the day. This was the annual shoot, there being a good supply of both live birds and targets. Shooters were present from Metamora, Morton, Spring Bay, Mossville, Washington, Pekin and Peoria.

A. C. Connors' shoot, held Saturday and Sunday, was something out of the usual order. Professionals were only permitted to shoot at 100 targets, and those not to be connected in any way with the tournament. Thus the high averages will go to the amateurs. The local papers printed in the vicinity of Pekin and Peoria, Ill., have been stating "that formerly the representatives of various ammunition companies have carried off the money and prizes at tournaments." This is not the fact. The professionals heretofore have shot for targets only, and as they invariably won the high averages, it is to this that Mr. Connor objects and has sought to remedy in his programme.

The new club at Leroy, Ill., held their first practice shoot on Saturday last. Such a good time was the result that the management forgot the newspaper man, hence the scores cannot be produced.

At Toledo, O., the gun club had an interesting shoot on Oct. 9. They had as guest, Mr. Frank Foltz, of McClure, O. He ran up a score of 97 out of 100, which was the best ever made on these grounds, and the targets were fast ones, 60yds.

It is reported that a herd of cows has been turned loose upon the shooting grounds used by the Kalamazoo, Mich., Gun Club, and as the members do not care to bag any of them, the practice events heretofore held by this club will be abandoned for this year.

A gun club has just been organized at Mt. Clemens, Mich. The membership numbers 24. Target shooting will be the pastime. The officers are as follows: President, Frank A. Compau; Secretary, Frank D. Petlier; Treasurer, Frank L. Tuscan. The members are enthusiastic, and propose to hold a State tournament soon.

At the last shoot between the Hermitage, of Nashville, and the Franklin, of Tennessee, the old team was too strong, and won out with plenty to spare. Each man shot at 100 targets, viz.: Hermitage—Legler 89, Meaders 94, Watkins 81, Martin 81, Armistead 82; total 427. Franklin—Campbell 83, Cliff 95, Ridley 57, Polk 81, Baab 79; total 395. The Peters trophy has caused much interest to be taken by the clubs in and about Nashville.

The Ishpeming Rod and Gun Club has been formed at Marquette, Mich., with some very pushing sportsmen. The officers are: President, Dr. A. Deadman; Vice-President, Dr. Louis Biegler; Secretary, Harold Trosvig; Treasurer, J. J. Johnson. There will be regular practice shooting events at the trap.

The Nicholas Park Gun Club, of Jacksonville, Ill., held a shoot on Thursday last, using the new trap for the first time. The object was to select a team for a contest with the Willow Branch Club.

The Ewell Gun Club, of Spring Hill, Tenn., has challenged the Hermitage Club, of Nashville, for the Peters trophy, now held by it.

Two gentlemen while shooting at targets on the grounds of the South Bend Gun Club were hurt by the use of shells which burst. A doctor was called to examine the eye of one of the unfortunate.

The shooting off of the tie between Hugh M. Clark and Max Witz, at Fort Wayne, Ind., will take place on Sunday, Oct. 16. There will also be a team shoot, five members of the Wabash club against the Corner Rod and Gun Club. These matches will no doubt prove interesting.

Garfield Gun Club.

Chicago, Oct. 15.—The appended scores were made on our grounds to-day on the twenty-fifth assembly of the faithful. In the trophy shoot, Dr. Shaw, Eaton, Goetter and Stone all tied for Class A trophy on 23, while Lute won Class B on 21 and Dr. Reynolds Class C on 13.

After the trophy shoot, Bullard and Goetter captained teams formed by choosing sides. Bullard's team won both matches on scores of 59 to Goetter's 45 in first and 55 to 45 in second; 70 targets to each team in first, and 60 to each team in second contest. Only six men were to a side in the last race.

The day was an ideal one for target shooting, being cool, and almost no wind. The attendance was not what it should be, but all passed off pleasantly, and all enjoyed themselves immensely.

Trophy contest, 25 targets:

DR. J. W. MEEK, Sec'y.

Dayton Gun Club.

The second monthly amateur shoot of the Dayton, O., Gun Club, held on Oct. 14, may surely be counted a success, as few hitches occurred, and the programme was run through smoothly.

The towns of New Lebanon, Greenville, Lewisburg, New Paris, Newark, Springfield and Eaton were represented by shooters, and the visitors all had a good time.

The weather could not have been bettered.

Rolla Heikes was high gun, breaking 160 out of 180. Taylor second, with 158. Watkins third, 157, and Cord fourth, with 155. Brandenburg, Potter and Wysong captured the three low gun moneys on 59, 66 and 68 out of 90.

The club desires to maintain the most cordial relations with the Cincinnati Gun Club. The squib which recently appeared in

print, does not represent the feeling of the club by any means.

While the regular programme was being shot, a few of those present shot sweepstakes over the magautrap. The scores:

	Shot at. Broke.			Shot at. Broke.	
R O Heikes	180	160	A Wysong	150	108
Taylor	180	158	Neff	60	42
Watkins	180	157	McCaughy	75	42

Schwind	180	131	Kempert	30	15
Potter	180	130	B Storms	30	12
Fisher	150	133	A Keller	15	11
Craig	150	129	E Keller	15	9
Clark	150	129	Bailey	15	8
Klepfier	165	118	Hanser	15	5
Burrell	150	112			

Cincinnati Gun Club.

Cincinnati, O.—Twenty-two shooters and a number of spectators were at the club grounds on Oct. 15. Gambell and Chas. Dreih settled a tie, miss-and-out. Gambell won.

In the cash prize shoot, twenty scores were shot. Gambell and Clark (a visitor) headed the list with 46 each. Then came Faran, shooting from 20yds., with 42, and J. T. Skelly, of Wilmington, Del., tied him. Herman, who returned from Minnesota with L. Ahlers a few days ago, was third with 41.

Faran's score of 25 straight in the cup race has not yet been equalled. Nine scores were shot to-day in that event, bringing the number of entries up to 74: Gambell 24, 19, 23; Medico 23, 22, 23; Peters 20, 17, 16. Gambell missed his first bird in the first trial, and then broke straight.

For practice, Keplinger, French and Meyers shot at 225 breaking 151, 156 and 166 respectively. Skelly broke 142 out of 175; Faran 107 out of 155; Tuttle 97 out of 150.

Cash prize shoot, 50 targets, distance handicap: Gambell (16) 46, Clark (16) 46, Skelly (16) 42, Herman (17) 41, Bullerdick (16) 39, Medico (18) 38, French (16) 37, Maynard (20) 36, Block (18) 36, Falk (17) 36, Myers (16) 36, Frohlinger (16) 36, Keplinger (16) 35, Peters (19) 33, Tuttle (16) 33, Andrews (16) 31, Tietig (16) 19, Pohlar (19) 35, Pfeifer (17) 34, Faran (20) 42.

Rohrer's Island and Tipp gun clubs shot a match at Tippecanoe City, on Oct. 13, thirteen-man teams. The day was cloudy and chilly, and a strong wind was blowing most of the time. The match was won by Rohrer's Island, of Dayton, their team leading from the start and finishing 33 targets to the good with a score of 527 to 494. The club medal was to have gone to high man in the team match, but instead of having the three leaders shoot off the tie, it was decided to shoot for the medal miss-and-out. Twelve men entered and the medal was won by Pease, of Vandalia, with 5.

Trap Around Reading.

READING, Pa., Oct. 8.—The annual fall target tournament of the South End Gun Club, of this city, held on the club grounds to-day, was a success. Apgar and Fanning were the trade representatives present. Apgar was high average man for the day with 171 broke out of 185 targets, with Frank Gerhart, of this city, second with 169. Fanning finished third with a score of 167. The scores follow:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	15	15	15	20	20	15	20	20	20	25
Apgar	13	14	15	19	18	15	18	18	18	23
Gerhart	14	13	15	16	19	14	18	18	17	25

Folk	10

Mahanoy City, Oct. 8.—To decide the live-bird championship of Schuylkill county, and for a side bet of \$250, Peter Haverty, of Pottsville, and Nathan Benner, of this town, shot at 21 birds each at Mahanoy City Park to-day a tie, resulting in 19 kills each. Another match will be arranged for increased stakes.

Norristown, Oct. 11.—The Trappe Gun Club opened the shooting season this afternoon, when a largely attended live-bird shoot for a hammerless double-barreled shotgun was held. Frank Henry, of Lansdale, and Isaac Johnson, of Norristown, tied for the prize. Sweepstakes were won by Emmers, of Royersford, and Frazer. The best scores follow:

Shoot for gun, miss-and-out: Isaac Johnson 18, Frank Henry 18, Traumber 17, Frazer 17, Emmers 15, Barnt 12, Bean 11, Knipe 9, Heist 8, Boker 9, Hooker 8, James 7, Roe 7.

Tamaqua, Pa., Oct. 12.—Thomas Fredericks, of town, and John Derby, of Summit Hill, have signed articles of agreement to shoot at 13 live birds each in the Lansford Park, Nov. 29, for \$150 a side and the gate receipts.

Media, Pa., Oct. 15.—The Media Gun Club opened their active season to-day with sides chosen by President Edgar Pennington and Harvey Howard. The latter's team won by a score of 151 to 134. The summary, each 25 targets:

Howard's Team—Howard 19, E. Smedley 13, Little 18, Rhodes 13, Leedom 12, Yarnall 12, Snowden 14, Dee 16, Sweeney 12, Rogers 10, Bonsall 12; total 151.

Pennington's Team—Pennington 19, S. Smedley 16, Reilly 14, F. Simcox 13, Fields 11, C. Simcox 14, Mitchell 10, Rigby 12, Baker 9, Leland 4, Lewis 12; total 134.

DUSTER.

New York Athletic Club.

TRAVERS ISLAND, N. Y., Oct. 15.—The attendance was slim at Travers Island, as the counter attraction of the last racing day at Morris Park caught a majority of the shooting members.

Conditions were fairly good, although a high wind and fast birds served to keep down the scores.

The first shoot for the monthly cup was easily won by Mr. S. G. Schroeder, a new recruit, who had never taken a prize before to-day. He won the first special cup event also. The other

LOWELL, MASS.

Sistersville Tournament.

SISTERSVILLE, West Va., Oct. 15.—The fall target tournament of the Sistersville Gun Club, which took place on their grounds here on Oct. 12 and 13, proved to be one of the best little tournaments ever held in the Ohio valley. The attendance was hardly what was expected, but thirty shooters taking part, and was all that could be handled with one magautrap.

The shooting commenced promptly at 9:30 o'clock, and there was no intermission, not even for lunch, until nearly 5 o'clock in the evening. I don't mean to say that we didn't eat, for we did, but it was at odd times, when it would not interfere with the shooting.

The weather, especially on the second day, was just a shade off color, but there was not a single complaint heard.

The magautrap—well, the old thing did herself proud. The boys all wanted to take it home with them, as they thought it the best one they had ever seen.

The cashier's department was in the hands of Mr. W. B. Woodruff, of the local club, and there is just one man in the world that can do better work than he did, and that man is the same little Woodruff, with a little more practice.

The affair was under the management of Ed. O. Bower, and it is hardly necessary for us to say that he was kept quite busy, although Ed says it is simply pie to run a shoot with such assistance as was rendered by the "two Johns (John F. Mallory and John A. Penn) as squad hustlers; Ralph Trimble, T. D. Priddy, W. T. Davenport, D. D. Gross and Snappy Watson.

These boys were here, there any everywhere at the same time, and whenever there was anything to do, they asked no questions, but did it. At a meeting of our club since above shoot, a resolution was adopted making these gentlemen honorary life members of our club, and we hope they will all live a thousand years.

The trade was represented by Ralph L. Trimble, W. T. Davenport and D. D. Gross. Everything passed off without a hitch, and all present seemed pleased and as happy as June bugs. The scores follow:

The scores in the special or merchandise event follow. In this event, which was at 25 targets, for Ithaca pigeon gun and 500 loaded shells, some great shooting was witnessed. Squad No. 1, composed of F. E. and J. F. Mallory, Ed. O. Bower, R. L. Trimble and Luther Squier, shooting at 125 targets, broke all but 4. This same squad in event No. 5, of the regular programme on first day, shooting at 75 targets, broke all but one, making a run of 74 straight breaks in this particular event. The scores: F. E. Mallory 24, J. F. Mallory 25, Ed. O. Bower 24, R. L. Trimble 25, Luther Squier 23, P. Schlicher, Jr., 21, C. W. Decker 25, W. A. Wiedebusch 25, G. M. Lilly 22, A. H. Donnelly 20, Jos. R. Miller 20, W. T. Nichols 21, W. T. Davenport 22, R. Harris 15, John A. Penn 25, Dr. West 23, "Snappy" Watson 25, R. L. Hibbs 21, C. P. Kinney 23, S. L. Stowe 21, S. T. Mallory 22, J. H. Ellsworth 18, Chas. J. Mowery 24, J. M. Sweeney 14, and J. W. Stewart 21.

After the handicap targets were added, it was found that fourteen were in the tie for first place with 25. The shoot-off was to be decided in the regular events that were to follow, and after the completion of the programme, or four strings of 25 in the shoot-off, four of the contestants—C. W. Decker, W. A. Wiedebusch, R. L. Hibbs and Ed. O. Bower—were still in the tie. In the following shoot-off, however, all dropped out but Mr. W. A. Wiedebusch, the popular boy from Fairmont, and he was declared the winner. C. W. Decker, R. L. Hibbs, S. T. Mallory, Jos. R. Miller and Ed. O. Bower each received 100 loaded shells. It was a hot race.

The following runs of straight breaks were made during the two days: Lon Fisher 121, R. L. Trimble 87 and 55, W. A. Wiedebusch 92 and 69, Ed. O. Bower 63 and 65. SYCAMORE.

St. Marys Tournament.

ST. MARYS, Pa., Oct. 10.—The first annual tournament of the Iff Gun Club, of St. Marys, Pa., was held on their new club grounds Oct. 6 and 7. In every way the tournament was a success, events being run off without any unnecessary delay. About forty shooters were in attendance, and good scores were made, considering the fact that on the first day a high wind interfered with the targets and the extremely cold weather chilled the shooters through and through. On the second day there was less wind, and the temperature had moderated considerably, and better scores were made.

H. Millen, of Du Bois, was high gun for the two days with a total of 296 out of 325 shot at. E. M. Jordan, of Corry, Pa., was second amateur high gun, with 292 out of 325 shot at. The special prizes for the two amateur high guns of a high grade Ithaca gun and a handsome leather chair, were awarded to these two men respectively.

L. J. Squier won the silver cup for professionals, with a score of 295 out of 325 shot at. The cup given by the Iff Gun Club for the best team of five shooters shooting at 25 targets each was won by the Du Bois team, with a score of 104; Kane team second, and Iff Gun Club team third. The members of the Du Bois team were Millen, Bergoon, Kelley, Wolf and Quinn.

In the merchandise event there were enough prizes to award each shooter a prize. Among the best prizes, A. Sizer, of Kane, and E. M. Jordan, of Corry, were tied for first place, with 24 out of a possible 25. On the throw-off A. Sizer won first prize, which was a chest of tea; E. M. Jordan second, which was a smoking jacket. A. Stohr won the pointer pup and J. S. Speer was fourth, winning 500 Peters shells. Among other prizes awarded were several reed chairs, umbrella and umbrella stand, case of wine, revolver, cigars, etc.

The feature of the first day's shooting was the special event between Dr. C. J. Jessop, of Kittanning, Pa., and E. W. Kelley, of Du Bois, Pa., \$50 a side, 25 birds, to be shot at. Kelley broke 20 out of 25 and Jordan 18.

Baltimore Tournament.

BALTIMORE, Md.—The two-day tournament of the Baltimore Shooting Association was held on Oct. 10 and 11. Mr. J. M. Hawkins made high average for the two days; Neaf Apgar second; George Piercy, Jersey City, and Wm. Wagner, Washington, were third. Mr. Hood Waters was ill, and that affected his scores.

The [Dalton Gun] Club.

DALTON, O., Oct. 14.—The tournament of the Dalton Gun Club, held on Oct. 6 and 7, had disagreeable weather on the first day, there being a cold, strong north wind. The attendance of local shooters was less than expected. The programme was arranged with a view to interest specially the 70 to 80 per cent. men. There was a good attendance from other sections, and the trade was well represented, and to these shooters the club feels very grateful.

High professional average for the two days was won by Mr. R. O. Heikes. He broke 376 out of a possible 400. Mr. C. A. Young was next with 373. F. H. Snow, of Cleveland, won the high amateur average for the two days, breaking 369 out of a possible 400. The longest run was made by Mr. Heikes. He broke 77 straight. Mr. C. O. Le Compte was next with a run of 72.

Expert traps, Sergeant system, were used. The management received many compliments on having such conveniently appointed grounds.

The trade was represented by Messrs. R. L. Trimble, C. O. Le Compte, D. D. Gross, C. A. Young, R. O. Heikes and H. J. Priddy.

All in all, the shoot was a success. The scores:

	First Day.		Second Day.		Total.

E. F. S.

Batavia Tournament.

BATAVIA, N. Y., Oct. 11.—The second annual tournament of the Holland Gun Club, held at Agricultural Park, to-day, had scores as follows:

Shot at. Broke.		Shot at. Broke.	
Jay Green.....	120	E Cox.....	120
S B Curtis.....	120	Wm F Huyck.....	100
J Knickerbocker.....	120	D Clark.....	80
Dr C W Gardiner.....	120	F T Wilcox.....	55
W C Wootton.....	120	A Bernhardt.....	40
F M Farwell.....	120	A Coughlin.....	40
R J Smith.....	120	C F Clark.....	40
W Heaman.....	120	A J Squires.....	20
J L Robson.....	120	L J Stein.....	20
O S Stull.....	120	H L Ames.....	20
H J Priestester.....	120	C A Williams.....	20
H Harrison.....	120		

The last event on the programme was a handicap, for club members only. James Knickerbocker shot from scratch at 25 birds; the others were handicapped by extra birds to shoot at:

	Shot at.	Broke.		Shot at.	Broke.
J L Robson, 6.....	31	20	Dr C Gardiner, 2.....	30	15
L J Stein, 7.....	32	20	D Clark, 5.....	30	15

J Knickerbocker, 0.25	17	17			

SIDE LIGHTS OF TRADE.

The Winchester Repeating Arms Co., New Haven, Conn., have issued a beautiful poster, which they will be pleased to send to those who apply for it. It portrays a mountain hunting scene, the hunter having brought down a fine mountain sheep.

The Hunter Arms Co., Fulton, N. Y., have issued a catalogue which fully illustrates and describes the functions of the single trigger, and the mechanical workings of it as applied to their L. C. Smith guns. A copy will be sent to applicants.

We are informed by Mr. G. Harry Squires that "the official announcement has been made through the British Commissioner that the Greener gun has been awarded the Grand Prize, which is the highest possible award."

Answers to Correspondents.

No notice taken of anonymous communications.

G. J. S., Yonkers, N. Y.—To decide an argument, I would like to ask whether suckers can be caught with hook and line, and the season of the year when they can be caught in that manner? Ans. The sucker may be caught with hook and line. Bait with worm or with dough balls, as for carp. The fish are usually snared or speared.

J. F.—A friend claims that the flesh of the rabbit is called venison. I claim it is not. I am willing to admit that the hare (he of the tawny coat), being wild game, his flesh may be called venison; but the rabbit, which is a different animal, though related, is a domestic pet, and its flesh, in my opinion, can not be called venison. Will you kindly define "hare" and "rabbit" and decide the above? Ans. In the old days the term venison was applied to the flesh of all wild game animals; modern usage confines it to the flesh of animals of the deer family.

Novice, Pasadena, Cal.—The writer would like your advice on the following: Am a novice in the use of the shotgun, my short experience being few times at the traps, bluebirds. The drop of the stock at the heel is 2 1/2 inches, and I feel very comfortable back of it. I am advised by some members of our gun club to have the stock bent to 2 1/4 inches, and by other members to have it bent to 3 1/4 inches. As the gun is a valuable high grade ejector, I naturally don't want to spoil its original lines by experiments. I will use the gun mostly in the field, and occasionally at the trap. 1. Is there any method usual to determine the correct drop of a gun stock for the individual other than the feeling of comfort when gun is held at shoulder? 2. What is the effect on the shooting of a very straight gun stock, and is such a stock desirable for all-around shooting? 3. Do you advise learning with the 2 1/2 inch drop, or would you have it changed? Ans. 1. The drop you mention, 2 1/2 inches, is about the best for all-around shooting; that is, at the traps and in the field. The real test is whether you can shoot with the gun comfortably and correctly. If you were to have it changed the volume of advice would not be lessened in the least. The method of determining the correct drop of a gun stock is by practical test on the part of the man who uses it. There is no arbitrary method. 2. A straight stock is used especially for live-bird shooting at the traps, for the reason that nearly all the shots are below a line level with the eye and parallel with the plane of the earth's surface; that is to say, a majority of the shots are between the ground and five feet above. The tendency of the straight gun is to over shoot; the tendency of the bird sprung from the trap is to rise; therefore, with a straight gun stock there is an allowance made to shoot above the bird without any effort on the part of the shooter to do so. The straight gun, shot at high-flying targets, or in the field, has a tendency to punish the shooter's face and thereby injure his shooting. On the other hand, the tendency of a very crooked stock is to undershoot. 3. We very earnestly would advise you not to have your gun changed. The drop of 2 1/2 or 2 3/4 inches are approved by the majority of expert shooters whose wisdom has been derived from long practical experience. In any event, so long as you have no specific personal reason to require a change, it would be unwise to make a change.

PUBLISHERS' DEPARTMENT.

Concerning Proctor's.

ONE of the most valuable features of the Proctor Stock Company performances is the opportunity it gives a clever actor to demonstrate his ability before an appreciative public. The Fifth Avenue Theatre, in particular, is constantly under the observation of managers of important attractions, and many of the stock company favorites have gone directly from the Proctor theatres to the leading companies, and have scored hits of large proportions because of the invaluable training they received in the stock company. Verner Clarges last season went from the Fifth Avenue to the Jessie Millward production of "A Clean Slate," and now again leaves the Proctor Company to join the Joseph Jefferson Company. George E. Bryant is now with one of Henry W. Savage's companies, while Lotta Linthicum, leading woman last season, fills a similar position in the company of Ezra Kendall, under the Liebler management. Previously she had left the Proctor Company to play a season with Chauncey Olcott. Wallace Erskine refused several offers to join Charles Frohman and Klaw & Erlanger companies, preferring to remain in New York. Bessie Barriscale interrupted her work at Proctor's to star in "In Old Kentucky," and is glad to be back in New York for an entire season, after the discomforts of the road. Eva Vincent recently scored the real hit of "The Scrooge-Comic Governor," in which Cissie Loftus is starring, and Asa Lee Willard, once leading man, has scored notable Broadway hits, his last success having been attained in Leo Ditrichstein's "The Last Appeal." Richard Lyle, for three years with the company as low comedian, is now successfully starring, and Al. Philips is leading man of "The White Tigress of Japan." Sumner Gard is now with the Virginia Harned company, while William Courtenay, her leading man, was the first to hold a similar position in the Proctor Company when it was established. Drina De Wolfe played her first engagement in America at the Fifth Avenue. This list might be extended to the length of a column without exhausting the names. The moral is that the Proctor plays and their manner of production form a priceless school for experienced players.

World's Fair Scenic Route.

BECAUSE of its magnificent mountain, river and cañon scenery, its famous battlefields, and points of interest, and because of its superior equipment and physical condition, providing all the comforts and safeguards of twentieth century travel, the Ches

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

COPYRIGHT, 1904, BY FOREST AND STREAM PUBLISHING CO.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, OCTOBER 29, 1904.

VOL. LXIII.—No. 18.
No. 846 BROADWAY, NEW YORK.

FOREST AND STREAM AT ST. LOUIS.

THE Forest and Stream Publishing Company has been awarded the Gold Medal at the Louisiana Exposition. We have not received the particulars of the award, but we are told that the Group Jury, of which Mr. Carl E. Akeley was chairman, particularly mentioned the FOREST AND STREAM and the company's technical publications. The exhibit consisted of bound volumes of the FOREST AND STREAM from 1873 to 1904, books on tourist travel, natural history, fishing, the dog, yachting and canoeing; and engravings of fishing scenes and sporting subjects.

The award at St. Louis is the fifth that has been won by FOREST AND STREAM. The list runs: Philadelphia, 1876, silver medal and diploma. Berlin, 1880, silver medal and diploma. Chicago, 1893, silver medal and diploma. Paris, 1900, grand prize, gold medal, silver medal, bronze medal, and three diplomas. St. Louis, 1904, gold medal.

NEW YORK AT THE WORLD'S FAIR.

ADVICES from the St. Louis Exposition state that the very handsome and instructive collection representing the fish and game of New York State, which is shown as a part of the exhibit of the Forest, Fish and Game Commission, has been awarded a grand prize and a gold medal. The grand prize is given to the collection of fishes, and the gold medal to the collection of animals and birds. Grand prizes were also given to the forestry exhibit, which is one of the most complete on the grounds. It is also stated that silver medals have been awarded to each collaborator in the preparation of this exhibit. The exhibit of the Commission was planned by Col. Wm. F. Fox, the State Superintendent of Forests, who was assisted in collecting the fishes by the secretary of the Commission, Mr. John D. Whish, and in the collection of animals and birds by the special agent of the Commission, Mr. Arthur B. Strough. It is understood to be the intention of the Commission to make the mounted specimens of fish and game a permanent exhibit at its rooms in the Capitol at Albany when the Exposition closes. The collection of mounted fish was prepared by Professor Denton, and comprises nearly one hundred specimens, representing very fully the fish life of the State waters. The birds and animals form an equally satisfactory collection, and both exhibits have attracted much attention. It is not likely that room can be found to make a permanent exhibit of the forestry group, which includes everything that should be found in such a collection, and is supplemented by a forest nursery in operation on the grounds outside the building where the display is made.

THE REVENUE FROM LAWLESSNESS.

THE State of Pennsylvania has made an extraordinary showing of revenues collected as penalties from violators of the fish laws. Pennsylvania's Department of Fisheries was established in June, 1903, with Mr. W. E. Meehan as Commissioner. From that date to the present, a period of sixteen months, there has been collected in actual cash from persons convicted of illegal fishing over \$10,000. Of this sum, one-half went to the informer, usually the warden. Of the balance, \$4,565.17 has been paid into the State Treasury, and over \$500 is still to be received from the county treasurers. In addition there were fines imposed amounting to over \$2,000, and the parties instead of paying their fines, served sentences in jail for one day for each dollar of fine unpaid. In addition there are a number of cases now before the courts, or unsettled, involving over \$2,000 more in fines, one for over \$1,700. Altogether the aggregate to the present time involves penalties to the amount of over \$15,000 for violations of the fish laws alone. The revenue was sufficient to cover the entire cost of the warden service for one year; and thus Pennsylvania has in large measure solved the problem of maintaining a protective force. The record may be approached, it is believed that it has not been surpassed by any other State. Further revenues have been drawn from license fees for fishing in Lake Erie aggregating \$2,269, or within \$1,000 of the cost of operating the Erie hatchery; and the humble eel has been made to add, as license fees for eel catchers, \$2,460 more.

The department now has five hatcheries in operation, one at Corry, one at Erie, one at Bellefonte, one in Wayne county, and one in Philadelphia county. Two—the one at Erie and the one at Philadelphia—are for food fishes. Two are for trout exclusively, and one for black bass and

yellow perch and pickerel principally. Two of the hatcheries were authorized by the last Legislature two years ago, and Commissioner Meehan points with satisfaction to the fact that both were ready for operation within four months after the sites were selected and the deeds turned over to the State. The ordinary annual output of fish, excluding the one in Philadelphia county and the one in Wayne county, is about 100,000,000, of which between six and seven million are brook trout.

MINNESOTA'S PINE LANDS.

PUBLIC-SPIRITED citizens of Minnesota who are concerned to stay the destruction of its forests and to end the system by which these valuable public assets are handed over to scheming land grabbers, are united in support of the demand that the prevailing law known as the Stone and Timber Act should be upheld. An illustration of one abuse fostered by the law is given by Gen. C. C. Andrews, Chief Fire Warden, in an official report, detailing how it is possible, and is practiced, to obtain pine lands from the Government in a fraudulent manner by taking advantage of the Stone and Timber Act privilege of purchasing 160 acres of such land at \$2.50 an acre. The law provides that no one person can buy more than 160 acres, but if the person is going into the lumber business, he needs more than 160 acres. People who buy the land in this way, sell out to large individual or corporate holders. "The land thus purchased may often be worth over \$50 an acre, and it was cunningly designed to enable large holders of pine lands to acquire title to the same at a low price. Of course, it would never do for Congress to say that any large corporation could buy up 20,000 acres of valuable pine lands at \$2.50 an acre, but that object is accomplished just the same in a roundabout way."

COL. BRUCE ON THE TROPHY.

THE statement which Col. Leslie C. Bruce, Captain of the American Rifle Team which competed at Bisley last year, makes on his return to this country, relative to the Palma Trophy matter is worthy of attention. It discloses the fact that when the National Rifle Association of this country returned the Palma Trophy to the British Association, it took that important step without having consulted in any way whatever the captain of its own team, the one man of all concerned who should have been referred to for the facts of the case, and for guidance as to any action. Col. Bruce was not asked to explain matters. He was not communicated with before or after the step of the Association. He was absolutely ignored; and it was left to him to learn of the return of the Trophy months afterward, and then by chance in London. This, it goes without saying, was a most astonishing course of procedure, and we can well understand his wholly natural indignation at what was not simply a slight, but had the ugly look of a deliberate and contemptuous endeavor on the part of President Spencer to make him a scapegoat.

At the meeting of the Executive Committee of the National Rifle Association of America held in Washington on June 11, 1904, Col. Bruce being then absent from the country, one of the preambles to the resolution returning the Trophy read as follows: "Whereas, we regret the evident differences of opinion which have been made matter for publication, and while we find the Captain of the American team made no secret whatever of the exact character of the rifles, believing this to be perfectly proper, which difference of opinion would never have existed had he officially submitted the rifles for approval, in accordance with the explicit instructions given by the President of this Association." We considered then that it was unfair to Col. Bruce that he should be selected for sacrifice, and in our issue of June 18 we expressed the opinion "the foregoing censure is undeserved, and as a defense it is fallacious and absurd."

Had the President of the Association consulted the Captain of his team before rushing into print, there would not have been such a bewildering series of contradictions in the several statements given to the public in exposition of the Palma matter. For instance, as quoted in our issue of July 9, President Spencer said that the Pope barrels of the American team were "taken along to England to meet a condition which was likely to arise," but Captain Bruce says on the contrary that the Americans went abroad with "but one set of barrels." Again, Gen. Spencer declared that Col. Bruce should have brought his rifles to

the front and have said that the Americans were going to use special rifles, "and I move that the team captains modify the rules so that the British, the Canadians, the French, and the Americans may all shoot with special barrels. Had this been done, there would never have been any controversy." Col. Bruce, the team captain, who was on the ground, says, on the contrary, "on the morning of the match the range officers made further and customary official examination of our arms in every respect."

While sympathizing, as we have said, with Col. Bruce for the treatment which has been accorded him by his association, we are bound to say that we find in his statement nothing to alter the view already expressed by us that the rifles used by the American team were not service rifles as provided for by the condition of the Palma Trophy competition, which prescribes that they must be "the National Military Arm of the country the team represents, being in all respects of the pattern adopted and issued to the troops for service. Rifles of private manufacture may be used, but they must conform to the regulation pattern and bear the official view mark." Under this rule it is impossible to conceive how the National Rifle Association of America, even had it consulted its team captain, could have retained the Trophy, inasmuch as the rifles used by its team were of a character contrary to the specifications, and as such could not be used. Nor is there anything in the rules which, had the matter been presented to the captains, would have authorized them to change the rules with respect to the arms used.

WE alluded the other day to the lawlessness of the Italian and other foreign bird destroyers who are a pest and a curse to the fields within reach of our large towns in various parts of the country; and an illuminating incident affording an illustration of the ways of these imported bird killers has just come to our knowledge from Massachusetts. One day last week a sportsman of Milford, who was hunting in the vicinity, came across a net in the woods such as had never been seen in that country before. He immediately notified the deputy fish and game warden, Mr. Arthur E. Smith, who repaired to the spot and laid plans for the capture of the culprits. The net was so concealed that unless a man should happen to stumble upon it accidentally it would not be discovered. It was seventy-five feet long and six feet in height; it was fastened to a ground line and had another at the top, both drawn tight so that the net was firmly held in a perpendicular position. The main body of the net was of a 6-inch mesh, and fastened by the top line and hanging loosely down on both sides was a second net of linen thread of one-inch mesh. A bird flying against this outer net would carry the small meshes through the larger one, and then drop down and thus form a pocket from which nothing could escape. The first time the warden visited the net there were pocketed in it six robins, three blue-jays and a woodpecker. Warden Smith ascertained that the net had been imported from Italy by an Italian of the neighborhood; and after a few days of patient waiting he captured the man. Because of an absence of any birds in the net at the time when he was caught, it was practicable to impose on him only a penalty of \$20. These engines of bird destruction are not uncommon on the Continent, and the Italians in particular are much given to securing birds in this way; but we have no room for them in this country, and we may well entertain the trust that for every net set up there may be a Warden Smith promptly on hand to destroy the net and nab the netter.

You may go duck shooting, and the sun may shine and the sea be calm, and the ducks refuse to fly, and your gun be useless from dawn to dark. Or it may blow great guns and the sea may surge and the old boat tug at the anchor and the rains drive and the ducks go to Jericho. And so with one untoward condition or the other or both your leave of absence may be frittered away and your baggage checked for home and your train boarded with never a duck to show for it all. And yet shall the outing not have been fruitless nor without its substantial good. You come home refreshed in body and soul, to eat with an appetite you have not known for months, an elasticity of step, a fuller expansion of the chest, a clearer head, a keener mind, a stouter grip on the day's work, and a more genial feeling toward your fellow men. It pays to go duck shooting when you get ducks; it pays sometimes when you get none.

THE SPORTSMAN TOURIST

My Friend Datto Pedro

I WONDER if you have ever seen a man who looked for all the world like a catfish. I did once, way off in an out-of-the-way corner of the world, and it made me most awfully homesick.

It brought back to my mind visions of a very small boy, sitting on the edge of "Pop" Hunter's father's coal dock, industriously fishing. The fishing wasn't very good there even in those days, but by close attention to business, a day with hook and line was usually rewarded by a string of a dozen or so perch and sunfish, with a chance of getting a catfish now and then, or better still, a bullhead. Just why it should have been considered a greater achievement to land a bullhead than a catfish, I don't remember, if indeed I ever knew, but I am sure that it was, and one of the proudest moments of my life was on a summer's evening many years ago when I nonchalantly strolled up the front path leading to the house with the entire family assembled on the front porch, carelessly swinging a 3-pound bullhead at the end of my fish string, and trying to look as if such catches were every-day occurrences to be taken as a matter of course. I remember, too, that I had a comfortable feeling that, come what might, my reputation was made, and that even if I never did anything else worth talking about, I still had brought credit enough on the family to last them the rest of my days. To be sure, this feeling of satisfaction was lessened a little by the knowledge that if "Pop" Hunter's father hadn't happened along just when he did, the bullhead would most probably have caught me, and a funeral instead of a sort of triumphant entry resulted. All this and more did this old Moro way off in the mountains of Mindanao recall to my mind, just because he looked like a catfish.

His name was Datto Pedro; only that wasn't his real name. His real name was Ahmi Deringbam, but we called him Datto Pedro, or Pedro, or Pete for short, and he answered to any of them indiscriminately; that is, at first. Later when he became wealthy—which in Moroland means power and influence and all that, just as it does everywhere else—he rather insisted on the Datto, and even hinted that as soon as he had accumulated a little more money, a few more esclavos, and another wife or two, he might divulge himself in his true character of Sultan.

One of the many strange customs of the Lake Moros is that they will never tell you their own name. If you wish to know the name of Datto A, you must ask Datto B, and vice-versa. It would be considered a serious breach of etiquette for you to ask Datto A, direct, and if you did so far forget the proprieties as to do so, he not only wouldn't tell you, but would be deeply offended as well. After Pedro and I became friends, I asked him one day why this was, and he told me the following story:

THE BABY AND HIS FATHER.

in Moroland a man whose name was Kaw. He was a very brave warrior and made for himself a great reputation among the Moros by his successes in battle and in the hunting field. But finally his victories turned his head; he became overbearing and proud, and went about shouting to any one he chanced to meet, 'I am Kaw the great warrior; do not forget my name, so that when you see me coming at the head of my men you may know who it is, and say to each other, it is Kaw the victorious, Kaw the brave, Kaw the unconquerable, Kaw the fierce, Kaw the greatest warrior on earth, Kaw the merciless to his enemies, and tremble,' and his wife would also boast that she was the wife of the great Kaw, and so on, until the people became tired of hearing the name of Kaw, and having it dinned into their ears morning, noon and night. Now it happened that just about this time when Kaw, from being

looked up to and respected for what he had done, had lost the friendship and become the laughing stock of the people because of his boastfulness and pride, the Bul-bul, the most powerful and dreaded of all the evil spirits that live in Moroland, chanced to pass through the country and heard Kaw shouting his name and telling of what he had done. He stopped and asked who it was that thus proclaimed his name so loudly and made such vainglorious boasts, and the people told him that it was Kaw, a warrior whose victories had turned his head so that he could do nothing but go about telling everyone he met who he was and what he had done. So the Bul-bul, who hates pride and boastfulness, turned both Kaw and his wife into crows, and decreed that they and their descendants

DATTO PEDRO AND GRANDE BARRIGA.

should forever afterward cry their names to anyone who approached them; and in order that the virtue of modesty might be cultivated among the Moro people, the Bul-bul further decreed that thereafter every Moro who needlessly told his name to each chance acquaintance should meet the fate of Kaw and his wife, and be turned into a crow when he died. And that, mi capitan," said Pedro, "is the reason why no Moro will tell you his own name; it is because he does not wish to be turned into a crow when he dies."

On account of this superstition most Moros of rank take the name of one of their children, usually that of the oldest boy, although not infrequently that of one of their daughters, and prefixing the word "ahmi," which means the father of, thereto, use it as their own. So Pedro's name wasn't Ahmi Deringbam, after all; but anyhow he *did* look like a catfish.

Pedro was a captain of industry; he appeared in our camp shortly after the battle of Bayang, which was fought just twelve days after we arrived in the lake country, and was the biggest little fight that took place in the Philippines. His mission in life at that time was to sell to us unsuspecting Americans various and sundry Moro arms for about seven times their actual value if he could get it; gradually coming down to a fair price if he couldn't, and we wanted what he had badly enough to dicker with him a couple of days for it. Like all orientals, Pedro dearly loved to drive a hard bargain, and always began by asking at least three times what he was willing to take for anything he had for sale. The Moros carry this method of trading to such extremes that many of us adopted the scheme of dividing the price first asked by five and offering that, gradually increasing our offer until one-third of the original price asked was reached, and stopping there; we usually got what we wanted somewhere in between. Sometimes when the Moro held out too long we found it to be a good plan to toss the price we were willing to give on the ground before him and then refuse to talk any more about it. They were rarely strong enough to resist the sight of the actual money, and nearly always closed the bargain. There was one thing they could never understand, however, and that was why one of our silver dollars, "which," said Pedro, "was no larger and sometimes not so large as a peso" should be worth two of them, and I am sure that they do not understand why it is to this day. I have often seen them give fifty-five cents of our money for a peso at a time when the latter was only worth about forty cents.

Pedro found the knives he brought in to sell to us on the battlefield where the Moros engaged in the fight had dropped them, or dropped with them, as the case might be, in trying to make their escape. Once found he would take them home, clean them up, put new handles on them, and bring them in to us and swear by all his gods that they were family heirlooms. At this time Pedro was not

what you would have called prosperous; in fact, he once informed me in a burst of confidence he was "mucho pobre," nor did his appearance belie his words.

After he had exhausted the market for knives, he took to building bamboo tent floors, doing the work himself, assisted only by his nephew, a bright little chap about twelve years old, named Lomocdi. His method of building a floor was interesting, and was as follows: First he would go out into the brush and get a dozen or so long bamboos as big around at the butt as he could find, which was usually about five or six inches in diameter. These he cut to the required length and placed on the ground parallel to each other and about a foot apart. Then with his working bolo he would cut strips of bamboo an inch or so wide and as long as the width of the tent, using both hands and one foot for the purpose, for the Moros all have semi-prehensile toes and can readily hold or pick up light articles with them. These strips were laid across the bamboos at right angles and fastened firmly to them with withes of split rattan, each strip being bound separately and forced as close to the one next to it as possible. When it was finished, it made the very finest kind of a tent floor, light, strong, easily kept clean, and, when well made, very durable. I used one of them in my tent at Camp Vicars for eight months, and it was as good the day I left as it was when first made. Over these floors we spread petatties, mats woven of grass by the Moro women, some of them being very soft and fine and often beautifully colored. The Moros use them for all sorts of purposes, but principally to sleep on or under, and a floor thus covered added greatly to the comfort of a tent.

Pedro did well building floors. Of course it couldn't last forever, but about the time he had supplied everyone in camp with them, it became necessary to hire Moros to cut grass for the horses and mules. Pedro's bid for this work was the lowest; he was given the contract, and his fortune was made. The grass contract was worth at least two hundred pesos a month to him, and with the capital thus obtained he went into the business of supplying us with beef cattle when they could be had. He started a pony pack train between camp Vicars and Malabang on the coast which could carry more freight, animal for animal, than our mule trains; a contract to supply fire-wood followed the one for grass, and he became a very prosperous Moro indeed. It was then that he began to be hard of hearing when addressed by any other title than Datto. In fact, he made so much money that the other friendlies began to clamor for a share of the work, and we had to divide the various contracts among them, turn and turn about, for a month at a time, but no one did the work so well or gave the satisfaction as did Pedro.

It was amusing to watch Pedro as he became more and more prosperous gradually emerge from a very ugly caterpillar indeed into a butterfly whose gorgeousness Solomon in all his glory might have equalled, but I am sure could never have surpassed. The first time I saw him

DATTO PEDRO, GRANDE BARRIGA AND LOMOCDI.

he was clad only in a very soiled breech-clout, a turban, and a broad grin, with Lomocdi for his only follower; the last time I laid eyes on him, which was the day I left Camp Vicars, he was attired in a brilliant scarlet and black turban, a pale green silk jacket made very tight in the body and fastened with small silver buttons, the sleeves of which were at least six inches too long and wrinkled all the way up his arms in consequence like a mousquetaire glove; a gaudy ancol or sash, a silk sarong draped around his waist, and a pair of old rose and black striped silk pantaloons, very baggy about the thighs and tapering down to the ankles, around which they were snugly fastened with small silver buttons like those on the jacket; and instead of Lomocdi being his only follower, he had three attendants to wait upon him and carry his kris, buyera and umbrella, besides forty

or fifty others working around camp on his numerous contracts.

Pedro's kris or knife was a very handsome one, and the only one I ever saw him use; he valued it highly because it had belonged to his father, and his father's father before him, and although I have several times heard him offered what to him must have seemed a fabulous price for it, he would never consider the offer for an instant, his invariable reply being, "Ah, no quierro." This veneration for the family heirlooms is very general among the Moros, and it is one of their marked characteristics. Lomocdi was the kris bearer, and it was his duty to always remain within reach of Pedro, so that the latter had but to stretch out his hand to find his kris ready to it should occasion arise that he needed it. Then came another little fellow whose name I never knew, because on his first appearance in camp he was dubbed by the men "grande barriga" on account of his aldermanic paunch, and was never afterward called anything else. His duty was to carry the buyera, the box containing the ingredients for a mouthful of betel, or, as the Moros call it, buyo. These ingredients are four in number—the nut of the buyo palm, fresh betel leaves, a sort of lime made from powdered shells, and some leaves of native tobacco, which I think are soaked in water or some other liquid. These are carried in small metal boxes which are often made of silver beautifully inlaid and carved, and which are in turn kept in a larger box of the same design, usually suspended from the neck of an attendant. The proper method of chewing buyo is as follows: One of the nuts is split in quarters lengthwise, and one of these quarters wrapped in two or three betel leaves; this is then rubbed across the teeth and gums several times and then stowed away in the cheek. Then a very little of the lime is scooped up on the end of the thumb nail—and be it said in passing, to have your nails as long as possible is quite the proper thing in Moroland, and is considered a mark of rank, as no one can do manual labor and have long finger nails—and conveyed to the tip of the tongue, which in turn carries it to the nut and leaves already in the cheek; lastly a piece of the tobacco is rubbed over the teeth and gums and sent to join the rest, and all you have to do is to chew it. I tried it once when I couldn't well get out of it, but never again, thank you; it nearly took all the skin off my mouth. Tabasco sauce and cayenne pepper are mild and soothing in their effects compared with it, but among the Moros everyone uses it, men, women, and children being addicted to the habit.

The third of Pedro's attendants was a cunning little fellow scarcely more than a baby, who had nothing to do but hold the umbrella when it was not in use, although sometimes, when Pedro brought his rifle into camp with him, Lomocdi carried that and the baby carried the kris.

Pedro was a mighty shrewd old fellow, and nobody's fool, and some of his remarks are well worthy of record. One chilly, rainy afternoon he came into camp with a bad cold and went to the doctor to get something to relieve it. The doctor, who was always ready to help out our Moro friends, gave the old man a big dose of quinine with a stiff drink of whiskey on top of it, which of course warmed him up and made him feel better at once; so when the effects began to wear off a little, he sought his friend Pershing and got another drink, and later came to my tent, where he got still another, and then announcing that he had a swarm of bees in his head, he departed for his house, which stood over the hill just outside of camp. Now, on a box in the front part of my tent just as you came in there always stood a bottle of whiskey, a jar of water, and two tin cups, one for the Moros and one for my other friends, as I used to encourage Pedro and other Dattos of my acquaintance to make themselves perfectly at home in the tent, the only restrictions being that they must neither sit on my bed or spit on the floor, quite a necessary rule in a country where everyone chews betel. Pedro had often seen one of my brother officers come in, pour out a drink of whiskey, say, "How!" and toss it off. He came into the tent one morning a day or two after he had had his first drink of whiskey, and without saying a word walked over to the stand, poured himself out a drink as he had seen others do, and after gulping it down, wiped his mouth on the back of his hand and looked at me in a triumphantly wicked manner, as much as to say, "Ain't I learning American ways, though?" Just to hear what he would answer, I shook my head at him in a sorrowful manner and said, "Oh, Pedro, Pedro! You know your good book (the Koran) says that you mustn't drink strong water, and I am surprised at you. Where do you expect to go when you die if you go on in this way?" He grinned at me in a sheepish sort of a way, like a small boy caught in his mother's jam closet, shifted uneasily from one foot to the other, and then replied: "Now, see here, mi capitan, the good book is all right, of course, as far as it goes, and will do very well for the women and children to follow closely, but you and I as men of the world know that a little whiskey is never going to hurt anyone, and what difference does it make, so long as no one sees me take it, and the pandita (priest) don't find it out?"

Another time we were sitting in my tent, and the conversation drifted along until we found ourselves discussing the Christian and Mohammedan religions. I was greatly surprised to find how well posted Pedro was on the subject of Christianity, and rather suspect that one of the many missionaries the Spaniards sent through the country from time to time had been trying to proselyte him. Finally, after looking at the two religions from every point of view, Pedro closed the discussion by saying that, in his opinion, there was very little difference between them, after all. Said he: "Mi capitan, the only difference between my religion and yours, is that I read my good book from right to left, while you read yours from left to right; otherwise our two religions are precisely the same."

The Moros, while being ostensibly Mohammedans, are intensely superstitious, and believe in all sorts of evil spirits, witchcraft and spells, and, as far as I could discover, pay quite as much attention to worshipping and keeping the many devils in which they believe propitiated and in good humor, as they do to their legitimate religion. In every one of their houses I entered, I found books on witchcraft, magic, and the interpretation of dreams, and no Moro would ever think of going into battle without his anting-anting (charms to keep him from danger) wrapped in the folds of his sash.

I tried on a number of occasions to get Pedro to discuss this subject with me, but never succeeded in getting him to say very much about it, other than that it was well to be on the safe side, and that it didn't pay to take chances. As he put it, "Of course I know that Allah is Allah, and that there is no God but God, but I don't know that there are no evil spirits and witches, so I keep on the safe side, and while I worship God as the pandita tells me to, I also try to do what I can to keep in favor with the Bul-bul and the others at the same time."

I asked him one day why it was that the Moros blackened their teeth, and he said that the only animals in Moroland that had white teeth were dogs and monkeys, and that if a man was going along the road at night and should meet the Bul-bul, and the latter saw his teeth gleaming white in the darkness, he might think it was a dog, and so, as no one would like to be taken for a dog by the Bul-bul, they blackened their teeth in order that there might be no mistake.

One day someone gave Pedro a pair of low patent-leather shoes about three sizes too small for him, but into which he managed to squeeze his feet. Naturally they hurt him, but he couldn't seem to understand why. I told him that they were too small for him, but this he wouldn't admit. I finally got him to take them off, however, and of course he was relieved at once. That night when he went home he carried the shoes slung around his neck by a piece of string, and the next morning when he came into camp without them, I asked him where they were, and was informed that upon reaching home the night before, his pandita had examined them and found that they were inhabited by a devil, so they had burned them up.

It was when the cholera came to Moroland that Pedro was in his glory. He had borrowed a rifle and some ammunition from me, and morning and evening he would go out and fire three shots in the air on each side of his house in order, as he said, to scare the cholera devil and make him afraid to come into the inclosure. All the Moros did this, and while the cholera lasted you could hear the hanging of guns and canons at all hours of the day and night. We thought at first that the firing was a salute to some dead Datto or Sultan, but later learned that it was done to scare or kill the cholera devils which the Moros believed hid in the grass and gulleys awaiting a chance to get into the forts and inclosures.

When I asked Pedro how he explained the fact that although the Sultan of Cardingillian, one of our friends, had been very careful and thorough in firing off his rifle and lantakas each day, the cholera had nevertheless come into his house and killed him, he sadly shook his head and replied that Cardingillian had always been a very poor shot, or that possibly the cholera devil had been hiding in a ravine and so escaped. Then he went on to tell me how only the morning before he, Pedro, had actually seen one of the cholera devils hiding in the long grass close to his house and had fired at it, and was sure that he had hit it, because it had flown away screaming.

Just before Christmas came I asked Pedro what one thing he most desired in all the world, and he replied without hesitation that his chief ambition in life was to own a revolver; so I promised to get him one, but before I could do so I was sent home sick. A few months ago I received a letter written by one of the interpreters, but dictated by Pedro, which read as follows:

"My very respected son" (Pedro adopted me early in our acquaintance), "I am well and I hope you are well. I have not yet received the revolver. When you left here I had only two wives, and I know you will be glad to learn that now I have three. Please send the revolver. If you want me to get you any ancolods or sarongs or krisies I will do so. Do not forget to send me the revolver. Your father, (Signed) Ahmi Deringbam."

I sent him the revolver.

AHMI COMMISSARIO.

Memories of Old New York.

Editor Forest and Stream:

It has occurred to me, an octogenarian sportsman of the old school, a whilom contributor to sporting journals and magazines of three score years and more ago, that some reminiscent lines of those times might interest your readers in contrasting the old and new ways of sportsmen, and the conditions then and at present in vogue. There was no leisure class then, nor any moneyed class, either, for that matter; every one was busied in one way or the other in making a living. Indeed, as a matter of fact, according to a little pamphlet still extant in some of our older libraries, there were not more than 200 men in the city of New York reported to be worth \$100,000; but still there were many ardent sportsmen in counting rooms and among professional men, hence economy, both of time and of money, was an important consideration with them. Fortunately, however, for the gunner and for the fisherman of this vicinity, he did not have to go far afield in search of game, as Connecticut, Long Island, and the Jersey meadows and stubble fields afforded him ample sport in the way of feathered game, while both the Hudson and East rivers abounded in game fish of several varieties. Indeed, the sportsmen of New York city who could afford but a few hours from his daily work could usually count upon a fair bag, without ever leaving Manhattan Island, both of woodcock and of quail, or might fill his creel from the waters about Hell Gate, where striped bass were constantly trolled for, weighing, as reported in a noted old fisherman's note-book, from 10 to 25 pounds. As to the prevalence of feathered game on Manhattan Island in the late '30s, I recall that when a pupil at Huddart's great school in Bloomingdale (now 77th street, but then far out in the country), our teachers coming out to school every morning in a stage wagon. Not so, however, Henry William Herbert, better known to your readers as Frank Forrester, who always drove out in his dog-cart, in which were apt to be stowed away a brace of Irish setters and shooting accoutrements, ready for an afternoon's sport on the upper end of the island. Strange as it may appear to your present readers, Frank Forrester was a pedagogue, and one of the finest classical scholars of the country, an artist of acknowledged merit, an Oxonian, the son of the Dean of Manchester, scion of one of England's noblest families; as a classical teacher, the idol of his pupils. To him I owe the development of whatever sporting proclivities I may possess; as they certainly were initiated in his

class-room, interpolated as were his lectures with a running fire of sporting lore and anecdote, for, although he exacted thorough preparation, still he was sportsman before all, and an intelligent question in that line was sure to draw forth a wealth of valuable information.

The modern sportsman often possesses scientific knowledge which he is apt to apply to the investigation of projectiles and explosives, and to his initiative and application do we owe the many and great improvements in our sporting implements; thus our "Joe Mantons" and "Westley Richards" have gradually given way to the breech-loader, to the hammerless gun and to the chokebore; but it was only after a hard struggle that the old sportsman was induced to lay aside his cherished double-barreled fowling piece and accept the new-fangled breechloader, which he had at first characterized as a mere plaything more dangerous to the man at the breech than to the object at which it was aimed. Indeed, it was only when he realized that he was being outshot and outclassed that, however unwillingly, he adopted the new arm; yet his "Joe Manton" and his "Westley Richards" will always have a niche in his *sanctum sanctorum*.

The breechloader has passed through many changes and improvements since its inception, and before reaching its present perfect condition; but the evolution was wonderfully rapid from the rickety old German and French movements and pin-fire to the present central-fire, and the old sportsman was about half right when he proclaimed that in its early stages it was a murderous machine.

Awkward and burdensome as were our old-time implements, it is doubtful if the sportsman of to-day derives a moiety of the pleasure from the care of his scientifically constructed implement that his predecessor did in the necessarily personal manipulation of his old muzzleloader, for the older sportsman's day was not ended by any means when he came in from the field until he had detached his barrels from the stock, washed and swabbed them out, had unscrewed the nipples with his nipple wrench, and assured himself that they were clean, had refilled his great powder-flask with a pound or more of powder, as likewise his shot-pouch; inspected his percussion-cap box, satisfied himself that his great leather boots (there were no rubber boots in those days) were properly dried and greased. Yet this was to him simply a labor of love, as then, with slipped feet upon the hob, pipe in mouth, he glanced with complacency at his fowling piece in the rack, bright and glistening, and pendant accoutrements ready for the morrow's foray. The modern sportsman is apt to be dilettante, as he has naught of this to do; he scarcely has to search even for the game, which is often preserved, and his servant or his game-keeper cares for gun and accoutrement.

Doubtless the old sportsman would be outshot nowadays at the traps, but he might reflect with some satisfaction that our crack pigeon shots do not as a rule shine in the field. As there were no traps in the old days, neither were there any public kennels, and but very few private ones, almost every sportsman owning and boasting of his brace of setters or pointers, albeit of uncertain pedigree. Indeed, the very best dog that I ever shot over, and I have shot over a good many in various parts of the world, was picked up a puppy on a public road, a derelict. After training him, I found him as nearly perfect as possible, equally good on quail, woodcock or English snipe. So much for pedigree. The Hackensack meadows were then alive with English snipe in spring and autumn, affording the very best practice for dog and gun; in fact, the sportsman who could average a good bag of English snipe needed no pigeon trap for practice, nor pedigree for his dog.

Wildfowl shooting always possessed great fascination for sportsmen, young or old, being eagerly availed of in the old days by those who could afford the time and money, as it required a considerable expenditure of either or both, especially of time, there being no railway along either our Long Island or our Jersey shores; consequently it necessitated long, tedious drives through deep sand barrens in order to reach the eastern end of Long Island or the Jersey shores, while to reach Peconic or Shinnecock bays involved a two days' wagon ride. Although there is still a large migration in spring and autumn over those bays, at the time of which I write it was inconceivably great. In the early spring myriads of swan, geese, and brant, and an endless variety of snipe, came north from their southern feeding grounds, bound to the Arctic regions, returning with their young during summer and autumn, thus affording fine sport. And even at present, despite the breechloader and the pot-hunter and the unsportsmanlike spring shooting of the fowl on their way to their breeding grounds, the migration still affords fairly good sport; indeed, I have recently heard of a case in point where a member of one of the Peconic shooting clubs left New York by early train, reached the club house by eleven o'clock, got into his shooting togs by noon, and was back by afternoon train in his New York club in time for dinner with a bag of 67 large bay snipe. I also recall that somewhere in the '80s Messrs. Wagstaff and Remsen, noted sportsmen, shot from their sunken sand boxes in Shinnecock Bay 105 geese in three days' shooting, taking no heed, of course, of the swarms of broadbills and black duck passing their stands in tantalizing procession. Old gunners will recall with pleasure their sport at South Oyster Bay, at Amityville and thereabouts, and will also remember the Vanderwater House, and Gelston Smith's old house, and the Hoff brothers, where, out of batteries, they bagged the black duck, broadbill, and sheldrakes.

Bay snipe in endless variety and number always attracted the summer gunner young and old to the meadows along our coasts, but the Quogue stands were always favorites with the New York sportsmen, and were especially noted from the fact that Governor (afterward General) Dix presided over them with autocratic sway. Indeed, his wonderful prowess with his old muzzleloader was, and is still, the burden of many a Quogonian lyric recounting gubernatorial exploit. Barnegat Bay then vied with the waters of Long Island Sound as a nesting place of the wildfowl during their annual migration, and afforded perhaps better sport owing to its inaccessibility, its shallow waters, and its sand spits being literally alive with fowl. Nor did the comparatively little destruction by native gunners tend to diminish their numbers materially or to disturb them. Swan, geese, brant, and ducks endless in variety and numbers would in foggy weather

congregate on the shoals and render nights sleepless with (in sportsmen's ears) their vocal music.

Squan Beach, with the Atlantic Ocean on the one side and Barnegat Bay on the other, was at that time a peninsula of sand barrens and sand dunes, a marine graveyard, each dune the monument of a fatal wreck, and was given over to the wrecker, a native fisher and gunner, who plied his trade as occasion might require in either line. There were several little cabins tenanted by these men and their families, which extended such hospitality as their shelter and coarse food could afford. Notably among them was John Maxon's, which was utilized by a coterie or close corporation of half a dozen or so New York sportsmen, embracing members of some of our best known New York families. Among them were the Schuylers, the Hamiltons, the Costars, the Livingstons, the Roosevelts, not omitting the names of Frank Forrester and Col. Bruce, some of whom annually spent a fortnight in the delectable mansion consisting of three rooms in which were three or four trundle beds in which the guests were expected to sleep double; and here, despite the entire absence of decent accommodation, these men, accustomed at home to every luxury, actually enjoyed roughing it, if only through

contrast with their every-day home life, although it required a strong love of sport to induce them to turn out of bed at 4 o'clock of a November morning and face perhaps a howling nor'easter accompanied by flurries of snow, row off in a sneakbox a mile or more to a distant point, and lie there on a partly submerged meadow until nightfall, but the return home with a bunch of geese, canvasback or redhead, amply repaid them. Chadwick, the best known gunner and wrecker on the Jersey shore, succeeded John Maxon, and his place for years maintained its reputation for discomfort and good shooting. Robert Roosevelt, Frank Forrester, and indeed many another, have spread the fame of the little seaside hostelry by pen and pencil, and Roosevelt's little book upon Squan Beach gives an amusing account of a passage-at-arms between the Chadwicks and Ortleys for the possession of intervening snipe flats.

Snipe shooting in those days was something worth while. I recall one morning in particular, when, after a violent southeasterly gale, our stand shot over a hundred large birds before breakfast, principally jack curlews, willets and yelpers; while the smaller varieties, dovitchers, etc., flew by in innumerable bunches.

I like now to recall a somewhat similar experience in duck shooting off Northwest Point. We had put out our decoys, but nothing seemed to be flying. Presently some fishermen came and began hauling a seine in front of our point. Thinking that the game was up for the day, we were about going home, when along came a bunch of redheads over our decoys, taking no notice of the fishermen, and they kept coming until we had shot away all of our ammunition, and had bagged 35 fine birds. Squan Beach is now given over to summer resorts, Chadwick's and Ortleys' gunning houses being tenantless, although a young friend tells me he made fairly good bags of snipe on the Ortleys meadows last summer, and one of your correspondents writes the FOREST AND STREAM of a party who have recently taken 324 pounds of channel bass, 71 pounds of striped bass, and one sheephead of 15 pounds; so it would seem that wildfowl still fly over its meadows, and that Barnegat Bay is not altogether fished out yet. Such being the case, I am surprised that those old gunnery houses should be unoccupied, and that some of our embryo sportsmen have not utilized them for fishing and shooting clubs.

Avus.

NATURAL HISTORY

The Tragedy of the Plains.

"WHAT became of those vast herds of *Bison americanus*, popularly called the buffalo, which formerly ranged over almost the entire interior of the North American continent, always receding before the settler, withdrawing beyond the Mississippi River about 1800, but remaining on the great plains of the West, furnishing almost the sole support of many tribes of Indians, and supplying the grandest of sport for white hunters, but disappearing some time in the '70s so completely, that only a few scattered remnants could afterward be found?"

The above question is one I have been asking for a score of years, without once receiving what appears to me to be a full and satisfactory answer. Volumes have been written, learned articles have appeared in various encyclopedias and text books, but where they attempt an answer at all it is always of one import:

"Killed by hunters." "Ruthlessly slaughtered by Indian and white hunters, merely for sport, or for the sake of the hides and perhaps a juicy morsel from the hump upon their backs, or a tongue."

"This is the result," says the New International Encyclopedia, in summing up this matter, "of a century of unexampled waste of one of the most numerous, interesting and valuable animals in the world, and it is an irretrievable national disgrace."

Not being able to agree with the conclusions of the writers above mentioned, it is my present purpose to undertake to trace the migrations of these animals into the more northerly latitudes, and to show something of the extent and manner of their death in those regions, a point which has seemingly received little or no notice in the discussions of this question which have taken place.

I was a pioneer settler in one of the interior counties of Dakota Territory, having located there in 1879, entered lands from the Government, and engaged for a number of years, in company with certain relatives, in general farming and the breeding of fine cattle and sheep. I was then fresh from my college studies, a country schoolmaster in the winter seasons, and a close student of all such works as I could procure, especially those pertaining to the latest developments in the natural sciences. I also filled several important official positions in my country during my residence there, which continued until after the division of the Territory, and the creation of the two States of North Dakota and South Dakota therefrom. I merely mention these facts in order to "qualify as a witness," as they say in courts of law.

If the reader will now pardon a slight digression, I wish to have something to say of the climate of that region, particularly of the severity of some of the winter storms which occasionally—quite rarely, as a matter of fact—visit it. The reason for this digression will be made clear further on.

I think I cannot do better than by attempting a description of what still remains the severest season on record, to-wit:

The Blizzard Winter of 1880-81.

The evening of Oct. 14, 1880, was as balmy and pleasant as you could wish an October evening to be. Sometime during the night it began to rain, and by daylight on the 15th had turned to snow, which was coming down very rapidly. The wind increased in violence, and by 10 o'clock you could not see an object twenty feet away. Although it was early in the season, and the temperature not very low, it was the severest storm of snow and wind I have ever witnessed, and one could not venture away from the house, or endure exposure longer than a few minutes, without great discomfort and not a little danger. The storm raged in this way until the early morning of the 17th, when the atmosphere cleared.

I had heard of "blizzards" before, but, although brought up in identically the same latitude but a few hundred miles eastward, and where the winters are extremely severe, this was the first storm of that character I had ever seen.

My explanation of this phenomenon, while perhaps not scientifically exact, is as follows:

The winds everywhere else than on the open prairies are intermittent. There is always something to break

their force. They are deflected from their course by mountains and valleys, woods and dales, and blow with a yanking jerky motion. Every time the lower strata of the air is thus checked in its onward course the force is broken and thrown downward along the surface. With the prairie wind it is quite different. Having a clear sweep over hundreds of miles of practically level surface, there is nothing to deflect it; nothing but the waving of the prairie grass tending in any way to check it. At times when these winds attain their greatest velocity they bear right on steadily every instant. There is no "backing up to get a new start," but an even forward pressure. This tends to give the air currents an enormous lifting power, inasmuch that one will often wish he were tied down to the prairie grass, in order not to soar away. It can then be better imagined than described what will happen when the atmosphere is completely filled with flying snow. It does not drift as with the ordinary intermittent wind, scudding along the surface in gusts, dropping to the ground every time the air current "buckles," but rises high overhead, filling the air so completely as to be perfectly and continuously blinding, rendering it extremely dangerous for man or beast to be out.

When the sun arose on the morning of Oct. 17, the entire aspect of the landscape seemed changed. The prairie at this point is quite rolling and cut by many dry water courses, although there is not a living stream in the country, and not a tree in sight. On that morning the whole country had been brought to practically a dead level. The quantity of that snow was almost beyond belief. Everywhere on the highest land it entirely covered the prairie grass, the shallowest places being more than a foot deep. Wide ravines twenty feet deep were full to the top with a mass of snow almost as heavy as water, and while it afterward went off on the high lands, much of this October snow lay in the low places until about May 1.

The task of finding cattle which had wandered away, and getting them home occupied me for the following two days. We had fortunately met with no loss, but some of the neighbors had not been so fortunate. I saw a pair of heavy, strong work oxen, which had passed over the brow of a hill and were standing on their feet in the drift, dead. Their backs were on a level with the surface of the snow, their noses elevated as much as possible, in an effort to prevent smothering, the large horns disclosing their location. In that position they had not frozen, but suffocated.

The winter following, particularly from January to March, was almost a continual succession of those terrible blizzards, with, of course, the additional discomfort of a much lower temperature than the one described. The first snow was constantly added to, and was packed by the winds and frozen so hard as to be nearer the consistency of ice than of ordinary snow. Long before spring the shallowest places on the tops of the hills were from two and one-half to four feet deep, the entire snowfall, not counting October, being estimated at more than twelve feet. The railroads were blockaded from early January, 1881, to about May 1. It was before the introduction of rotary snow-plows and other modern machinery for the purpose of clearing tracks, and all the shoveling and "bucking" with locomotives, which the employees of the company reduced to a science, only piled the snow the higher over the center of the tracks, forming a huge turnpike, with the next drifting wind.

I left my interests in the hands of my relatives in November, and made a business trip to my old home on the banks of the Mississippi. When ready to return I was prevented from doing so by the blockade. On inquiring of the superintendent of the division as to when the railroad would be opened, he showed me a recent photograph of himself, standing on a box-car in a cut originally three feet deep, reaching upward with a lath, to the level of the surface of the drift. This convinced me that the railroad company would never open the line, but that they would be compelled to wait for the thaw to do it. Fearing my farming interests would suffer before that time, I set out about April 10, with the intention of walking over the blockaded region, about 150 miles, to my home.

Wonderful sights were to be found on that trip. My first dinner was obtained at a farm house which was literally buried in snow. To gain admission to the back door, the farmer had dug a tunnel high enough and

broad enough to walk through comfortably. A branch extended to well and stable, leaving a roof over the top on which we heard the cattle walking as we inspected it. He expressed a fear that when the thaw came the cattle might break through and fall into the well. I am afraid, however, that he was compelled to move out a few days later, for the next time I passed that location it was a lake.

My traveling companion on that walk was an attorney from the next county west of my home. He telegraphed ahead from a point on the State line to say that he was walking through. The answer came back: "Bring a loaf of bread in your pocket. We are living on shingle nails." However, we were already out of the "white flour" country, and well advanced in the "home-made graham" belt. As there was wheat to be had, though no mill to grind it, at my home, I did not reach the "shingle nail" territory. Doubtless if I had, the diet would have been "railroad spikes" before I had satisfied my appetite. A visit to that region today would reveal many an old coffee mill which did duty in 1881 in grinding the "flour" for the family, now carefully preserved as a relic.

In the matter of fuel, it was "axle grease day" at one town we passed through. It came a little high, but there was no standing at expense. Prairie hay, however, was the main staple fuel, in town as well as country. This was but the second season of the operation of the road, and one hundred days' blockade had exhausted nearly everything in the way of supplies. The mortality among the people had been much less than one would expect, they having early learned to be very cautious about exposing themselves to the danger of being caught away from shelter, in case of a sudden blizzard.

Walking and even teaming over the snow crust was perfectly easy, and snowshoes were in considerable favor.

The third day, after my arrival home, it being near April 20, it began to thaw. The sun was now high, and when the south wind finally condescended to assist, there was no let up night or day until the snow was gone, and no frost from that moment until autumn. Raging torrents cut through those blockaded water courses, forming great islands of snow, which soon slunk away, and the seed time was with us in a remarkably short time. "Old Sol" had also opened the railroad, but so many lakes formed in unexpected places as to give the company new troubles and further delay in the running of trains.

A distinguishing feature of this particular part of the prairies is the number of intermittent lakes which abound. Some of these lakes are eight or nine miles long, and contain several thousand acres. Others are but small marshes of one hundred acres or less. Indians and others long in the country claimed that there had always been alternate periods of wet and dry seasons, the lakes filling and drying out in quite regular cycles.

The last shadow of Indian title to these lands had been extinguished July 13, 1869, and the lands were platted by Government surveyors and became subject to homestead entry in 1873 and 1874. At that time, as the work of the surveyors clearly indicated, the lakes had been full of water. When I rode an Indian pony into the country in October, 1879, the lakes were perfectly dry, and bearing grass that would have yielded five tons of hay to the acre. The largest one was then burning over. The fire was communicated from the heavy grass to the peaty soil, and great holes several feet deep were burned out, and smoldered for many weeks, showing that the soil itself was thoroughly dried out. This would have required a period of extreme drouth of at least seven years. When this snow of 1881 went off the lakes were again full to the brim, and I believe have never since thoroughly dried out as before.

As the blizzard winters come at the periods of greatest moisture, I think it safe to say that the last of a series of such winters had occurred not later than 1872. This is borne out by other evidence, although exact records of so early a day in an uninhabited country are difficult to obtain.

Of succeeding winters which I witnessed there, none approached in severity the one above described, and some were actually as mild and pleasant as if removed at least 1,500 miles to the southward. As a rule, however, the mean average winter temperature is about

zero, Fahr. Personally I have never seen but two blizzards since that date.

A Lesson in Bones.

Readers are doubtless familiar with the oft published story of the wholesale slaughter of the buffalo on the more southerly plains, beginning with the opening of the Union Pacific and other roads entering the region, the introduction of modern breech-loading weapons, the entry of the commercial spirit which sought to traffic in large numbers of hides, and the wholesale methods of slaughter adopted by both Indian and white hunters, in an effort to supply this demand. I shall have no space to repeat what others have written, but must confine myself to showing what the buffalo themselves were doing in the meantime, as they certainly proved themselves not the kind of game to stand still and be slaughtered.

When, after considerable rambling over the prairies of western Minnesota and the eastern counties of Dakota, I reached a point a few miles to the westward of the Big Sioux River, I noted with astonishment the enormous number of skeletons of buffalo lying bleaching upon the prairies. These skeletons, with the great round skulls and black, shell-like horns, were in a perfect state of preservation, and but few gave any appearance of having been disturbed since the death of the animal. I had always associated these animals with the prairies from Nebraska southward, had never heard of their being hunted in Dakota, and was at a loss to account for the presence of these bones. The explanation that they had been exterminated by hunters never satisfied me. Counting the skeletons on the half section entered by me, I found that they numbered fully two hundred.

I said to myself: "If hunters killed these animals I can find broken limbs, and rifle balls marking ribs and other bones, and if they were as hard to kill as claimed, some of them should show many such marks." I therefore searched often and diligently, but the evidence was lacking. A stray shoulder blade, older in appearance than the rest, had a steel spear-head sticking through it, as evidence that an Indian had killed this animal many years ago; but on the newer looking and complete skeletons no mark of violence was to be observed, and I felt that some great error had been made in assigning the cause of their death. After witnessing that blizzard winter, I concluded that what was being overlooked was the part played by those three "smart fellows" of the old nursery rhyme, "Jack Frost," "Tom Snow" and "Borean Dan," who had evidently held the trump card in this great American tragedy of the nineteenth century.

The Passing of the Bison.

After a most searching investigation of this subject, I am now satisfied that the following is the true history of this tragedy:

The buffalo were migratory in their habits. Long distance traveling was their long suit. It is probable they could wear out the best horse in a month's chase. Unlike our domestic cattle or the slow moving buffalo of the far east, the bison could strike a lope and keep it up by the hour, without once breaking the gait.

To the north of their native ranges, beyond the "big bend" in the Missouri River, and stretching away four hundred miles lay the great grassy prairies of the Territory of Dakota, then an uninhabited region, there being not even an Indian making a permanent home anywhere between the Big Sioux and Red Rivers on the east and the Missouri River on the west, except perhaps at some such location as Devil's Lake. Driven from their old ranges between the Rio Grande and the Platte, the buffalo swam the Missouri above the big bend—and never came back. Writers have noted the fact that they swam this river in immense herds numbering many millions, but the point not observed is the vital one—they never came back. Old trappers along the river and early settlers at Yankton knew it, and often asked each other: "By what instinct does the buffalo always swim the Missouri in one direction? Why does he go from Nebraska into Dakota in the spring, but never return in the fall?" He was fleeing from the incessant crack of the rifle, and from the traps and pitfalls prepared for him by "pot hunters," and, though he knew it not, to a fate more certain and terrible than that he was leaving behind.

Upon reaching these quiet pastures the herds naturally split into smaller bands, under the leadership of the strongest bulls, each band choosing its own feeding grounds, from which the leaders would drive off all intruders of their own species. For protection against prowling wolves and other enemies, it was their habit to gather at night in a particular spot, choosing an elevation from which they could obtain a good view on all sides, and returning to the same spot every night. They must have maintained quite a military formation, with a guard of the strongest animals on the outside, where, as one observer claims, they marched in a circular path throughout the night, while another maintains an intruder would have found a bristling line of heads turned outward all round the circle.

These yarding places were very plainly marked before the soil was put under cultivation, as the prairie grasses, once subdued, are never renewed again with the same varieties. They were exactly circular in form, and one which I plowed through in 1880 was fully one hundred feet in diameter, and might easily have yarded two hundred animals. The weeds which would have grown upon it during the first few years after desertion had disappeared, and a new sod had formed. The odor of the barn yard was still very marked upon it, and the first crops plainly showed the effect of the fertilizer. From these facts I estimated at that time that it had been deserted about nine or ten years.

It will be seen, then, that it would have been necessary for new arrivals to move on toward the north, until they reached unpreempted pasturage, which would lead them entirely across Dakota and probably across the British Province of Manitoba as well.

On these ranges the herds would be fat and sleek in the fall, for the grasses are of the very best, and never fail in dry or wet seasons. They would also survive one of those mild winters I have mentioned, and be in fine

condition in spring, as the buffalo grass dries into a natural hay, which is sweet and nutritious all winter. Even in the more common colder but snowless winters it is not probable they would suffer much loss. In case they so survived for several years, their numbers would increase enormously. But when the snow lay deep upon the ground, and the great blizzard came down from the north, no escape was possible. Many would be buried where they sought the shelter of some hill or sharp break in the prairie, and share the fate of the old oxen. Large clusters of bones found in such spots indicate that this happened. Those which survived the storm would most certainly be doomed. Not a spear of grass could be seen in 1881, and no grass-feeding animal except the jack rabbit could possibly reach it, and I do not know how he managed to do so.

That season of 1881 marked the end of the antelope, a handsome little animal of the deer kind, which used to watch me from his point of vantage on the top of a neighboring hill. His feed cut off by snow, his slender hoofs breaking through the crust when he tried to run, he was at the mercy of his enemies, man, dog and wolf, and not one survived in that region.

As late as 1869 or 1870 large herds of buffalo were seen swimming the Missouri. About 1872, when the Northern Pacific Railroad was graded through west of Fargo, the bones were lying everywhere upon the prairies. At that time particles of hide or sinew were still attached to many of these bones, showing that they had not been exposed to the elements longer than one or two seasons. Rumors of herds of live buffalo were also heard up to 1875, but always, like the mirage in the desert, at some distant point. Diligent inquiry failed to locate them. One settler claimed the distinction of having killed a lone animal, which must have survived in the shelter of one of those small fringes of stunted timber which border a few of the permanent lakes. He is the only man I ever saw who claimed to have killed a buffalo in Dakota. If there ever was an extended hunt by white hunters in the interior of that territory, I have been unable to learn of it. There was no chance on these open prairies for the methods of the pot hunter.

Ask the settler how these bones came there, and he will probably answer: "I suppose the Injuns killed 'em for fun." Ask the Indian, he will grunt, and offer no explanation.

Eastern Dakota (by which I mean that part of the two present States lying east of the Missouri River) has an area of fully 80,000 square miles. Let us suppose 50,000 square miles of this to have been included in the buffalo range. The half section I have mentioned lies upon the extreme eastern limits of this range. There were places where the bones lay much thicker than there, and where they were gathered and shipped in car lots, for commercial uses. I will, however, estimate on the basis of two hundred per section, or square mile, and we have 50,000 square miles, with 200 per square mile, equals 10,000,000 skeletons scattered over the prairies of eastern Dakota, in 1880. This we would be compelled to double, in order to include Manitoba, giving 20,000,000 as a conservative estimate of the remains of those herds which swam the Missouri near the Nebraska line, and which I believe must all have perished in one season. The question I will leave open is whether any buffalo remained at that time in eastern Nebraska and Kansas, to share the same fate.

That similar things had happened long before, I think I have found proof in the writings of Washington Irving, who himself killed a buffalo in Nebraska, in 1832. In one of his interesting accounts of western adventure, as his hero, Captain Bonneville, was traversing the valley of the Platte, in 1832, he notes the following incident: "At one place he observed a field decorated with buffalo skulls, arranged in circles, curves and other mathematical figures, as if for some mystic rite or ceremony. They were almost innumerable, and seem to have been a vast hecatomb offered up in thanksgiving to the Great Spirit for some signal success in the chase."

Whence came these skulls of animals, which must have been dead long prior to 1832, in a region where the only hunters had been savages with long-handled spears? They could not have been killed by these savages, as was evidently supposed, but the dry skulls had been gathered upon the prairies. We will refer the question to some rancher who has lost his herds in the forks of the Platte, in some more recent hard winters.

Let us now look to the westward, and we shall find that by far the larger numbers of these migratory herds passed over those great arid plains between the Black Hills country and the Rockies. On those plains they found practically no feed, the vegetation consisting of cactus and sage brush. They therefore kept straight on to the north for more than a thousand miles from their starting point, millions on millions of them never pausing until they reached the fertile regions of the Saskatchewan, across the border in what was then the Hudson Bay Company's territory, a country in which hunting was a practical impossibility. A friend of mine who assisted in locating the line of the Union Pacific Railroad across those plains in 1867, was blocked for hours at a time by the northward rush of those mighty herds, an experience not at all unusual.

When the Canadian Pacific road was built through the Saskatchewan valley about 1882, observers reported that the prairies appeared white with the skeletons of something like 5,000 buffalo to the square mile. These bones were piled in mountain heaps at the railroad stations, where they were gathered for shipment. A stream was named "Pile of Bones River," and the present capital of Assinobia territory, Regina, was originally "Pile of Bones."

Year after year great herds of southern bred animals had rushed into those northern regions. Fierce and terrible must have been the fight for supremacy upon those limited pastures, for there were more animals than the grass could support. Here, too, the winters shut down early, and a temperature of 50 to 60 below zero is not an unusual thing. Clearly, without feed or shelter, and with the addition of this terrible cold, not one could possibly survive. The wooded regions were occupied by a stronger and fiercer buffalo, long

inured to that climate, which easily kept these migratory herds at bay.

In the fertile sections of Montana and Wyoming they would probably fare somewhat better, but still not be entirely safe. Stockmen have found that their cattle will live upon the ranges, even if the snow is quite deep, so long as it remains soft, so that they can paw it away after the manner of the reindeer; but when the chinook wind blows over the passes from the Pacific and softens the top of the snow, forming a crust with the following freeze, it is all off and the stock must be fed, or perish.

We have now disposed of everything except the Panhandle of Texas, portions of western Kansas and eastern Colorado, and certain sheltered spots in the mountains, as being about the only spots where the herds could possibly survive a really severe winter. And was not that condition after 1872? After that date hunters were pursuing the "southern herd" and the "mountain herd," which might more properly have been mentioned as broken remnants, for that is all they were.

There was no realization of the fact, but there was a spring when the sun arose over an awful spectacle of death and desolation upon the prairies; when there was food there for all the carnivorous birds and beasts in the world; the tragedy was complete, and the buffalo never would come back.

As long as those great herds were in existence, there never were hunters in all the west to keep down the increase, I care not what methods they adopted. After they were scattered and gone, the rest was easy, and the race was almost extinct before there was any realization of what had happened.

I am sorry to deprive the hunter of his glory, but is not here circumstantial evidence sufficient to convict "Old Boreas" in any court of record?

CHICAGO, Ill.

ROMANZO N. BUNN.

Buffalo and Quail.

Editor Forest and Stream:

Reference in an editorial to the theory of a western correspondent that the buffalo were wiped out by hard winters, not slaughtered by hide-hunters, recalls to mind the testimony given by Col. W. F. Cody, Buffalo Jones, and others to a committee of Congress having under consideration a bill setting aside a large tract of Government land for a buffalo range and providing for restoration of the herds. Col. Cody testified then, and he has told me since, that the extermination of the buffalo herds was instigated and encouraged by the generals commanding the troops on the frontier as a military measure against Indians. The buffalo was the red man's commissary on the hoof, and while the herds roamed the plains the Indians could not be kept on the reservations. In order to control the Indians, the military authorities decided that it was necessary to deprive them of the source of supplies for their war parties. Generals Sheridan and Sherman approved the plan, and the slaughtering was done by troops, and by Crows, Crees, and other friendly tribes, who were encouraged in the work and assisted with ammunition. The virtual extermination of the great herds was accomplished with startling celerity, it will be remembered.

Col. Cody, Buffalo Jones, and men of their sort must be credited with accurate knowledge of the things they talk about. So it is quite possible that the obloquy heaped upon hide-hunters and tourist sportsmen for many years has not been wholly deserved. How much the hard winters had to do with the obliteration of buffalo cannot be determined until we see the evidence collected by your western correspondent. Incidentally the destructiv and miscreant hide-hunter may turn out to be another busted myth.

I note in your columns a paragraph about quail taking to trees in Virginia. It refers, doubtless, to the Bob White. Years ago in the Sierra foothills I hunted California blue quail and noticed that when flushed and scattered they frequently flew into the branches of oak trees. Starlight, a Gladstone setter of high quality, over whom I shot during one season, often pointed birds in trees. In New Mexico the quail habitually go into the trees at dusk and roost there all night. I had a shooting companion whom I could not dissuade from the habit of potting birds from the trees on the way home after a day's shooting. He would shoot fairly all day in the field, but if his bag was smaller than mine, he would get out of the buggy on the way home, run over to a cottonwood clump, and turn loose both barrels at dark masses in the branches. He usually returned to the buggy with half a dozen or more quail, and when we reached home he would display his bag and boast of having beaten me at shooting.

ALLEN KELLY.

The Drum of the Partridge.

NEW YORK, Oct. 20.—*Editor Forest and Stream:* Will not some of your readers kindly advise in your columns whether partridges ever "drum" in the autumn months. If they do, is it the old bird or the young one, or both?

An editor recently cut out for me a reference to the drumming of partridges in the Adirondacks, and said, with much scorn: "Partridges, you know, never drum in the fall! Only in the spring, sir!"

How about this? Last Sunday, near Stamford, Conn., three of us in the woods there heard a partridge drum—or did we? Mr. W. J. Long, who resides at Stamford, had been invited to our pork-and-beans dinner at the tent in the woods on the banks of that fine trout stream. He was not present. Can it be that he was concealed out in the forest, and had some kind of buzzer that he let off to make us think we heard a partridge drumming? Strange things happen in Connecticut, and Mr. Long has been accused of making birds do unusual stunts. That he was responsible for this seeming drumming is further evidenced by the fact that Dr. R. T. Morris, the owner of the forest, had told us a dozen times that we would not walk ten steps further without "raising" a partridge; and not one rose.

Further, when a partridge drums, does he beat his own breast with his wings, or the stump, log, etc., on which he stands, or both? Some of us who have been privileged, a few times, to watch Sir Partridge from afar at such an interesting juncture, feel pretty sure that at least the first four or five slow beats of his wings are against his own breast. After that we are not so sure. L. F. BROWN,

Those "Sleeping" Dusky Mallards

What, never?
Well, hardly ever. —Pinafore.

Editor Forest and Stream:

The red gods fly scored many rises; the dusky mallard gets more. Your paper certainly has a wide circulation, and is closely read.

Mr. John Burroughs, in the July issue of *Outing*, asserts that while he hunted ducks he "time and again" reached for his gun to shoot at dusky mallards that he knew were all sleeping soundly. This while hardly within gunshot of the ducks; and the mere act of reaching for that gun while the ducks did not see him, waked them all instantly! That was "duck-and-man telepathy!" And this is proof of his claim that he is a duck hunter; yet in the very next (August) issue of *Outing*, he specifically declares he is *not* a duck hunter!

The above allegation, that he had "time and again" seen groups of mallards "all sound asleep" was made the subject, in *FOREST AND STREAM*, of a general denial by me, in these words: "No man ever saw two or more dusky mallards (*Anas obscura*) that were all asleep together."

The assertion, and the general denial, formed an issue, with the duty resting on Mr. Burroughs or his advocates to prove a statement so ridiculous that it is pitiful. And that is all the "dogmatism" contained in the denial that has served its purpose, as of course no one has ventured forth to prove an impossible case. Even those who choose to treat the denial as an original assertion and demand that I prove it, admit in these columns that Mr. Burroughs could not have known those ducks were asleep in any one of the cases that he observed "time and again."

Now, as long and exceptionally excellent opportunities for observing dusky mallards have been enjoyed not simply by me, but by some famous ornithologists who have devoted their lives to studying and writing about web-footed wildfowls, facts known about them warrant a presumption by a legitimate process of reasoning that "No man," etc. But I cannot permit men who are watching for chances to trip me to force me into the false position of appearing to assert that I have always had, and still have, all the eyes of all the men in the world since the beginning of mankind. This is absurd. To challenge me in scorn to prove it, is more absurd. To those not unfriendly it will be enough to disclaim ever having intended to place myself in such a position. But it is my full belief that no man ever did see a group of dusky mallards that were all asleep, without sentinels. When the illustrated article about hunting ducks with field-glass and camera appears here, readers will note that it is the height of improbability that any man since the beginning of time has seen dusky mallards with habits that have been so clearly known and observed, all asleep together. Meanwhile, readers are invited to read carefully what I separately wrote in the article which contained the general denial of the allegation by Mr. Burroughs.

How little I spare myself to unipicked readers here that are alone worthy of consideration, will be manifest from the following incidents showing how I have been scored, not by foes in a former contest, but by personal friends and comrades. By virtue of what sense of humor do they treat my denial as making me a legitimate target for practical joking, and will not let me confine that denial to dusky mallards under normal conditions?

Two days after *FOREST AND STREAM* printed that denial, a broker at 50 Broadway telephoned, "Come here in a cab, quick! Matter life and death!" Hustled to his office, where he showed three old wooden decoys that he had decorated with little white nightcaps, and shouted: "Dusky mallards all, and all asleep together! Cigars on you. Want two mild ones for a quarter."

Cigar money gone, and a dollar for a cab used in driving two blocks!

From away out near Nakusp, in British Columbia, my old comrade, George Abriel, mails to me a horrible pen-drawing of three ducks snoring quacks from three beds, and of himself leading me to their bedsides and saying: "They are asleep; be not afraid." Four cents postage due on the letter!

Last week a fishing-tackle dealer hailed me on Greenwich street with, "Step right in here and let me show you a cold storage plant." There he stopped me before many hundreds of dressed fowls, and I asked what they were. Note his crushing reply: "Group of dusky mallards all asleep together. You do not even recognize them. What do you know about ducks, anyhow, and now you can't say 'No man,' etc."

From Main River, in Newfoundland, that waggish Italian merchant, Antonio Nardini, sent me a package, received this morning, with charges not paid, that contained a cabbage head, and a letter as follows: "If you will come here again right away I'll show you 'telepathy' that works backwards—mallards not waked but all put to sleep with gun, powder and shot, and not a sentinel bird in sight." Even the cabbage had been sliced and ruined by the men of the United States Customs' Collector at Bangor searching for dutiable stuff that they thought the cabbage might conceal!

While I care nothing for men who are not only opponents, but unfriendly, these sarcasms from friends come home to me. Five telegrams, three with full charges on them, eight or ten telephone inquiries, and as many letters, have also asked me in substance, "How do you know that no man," etc. I never was so tired of any words, and of a denial being treated as an allegation.

And here is the last straw. At luncheon to-day a former comrade at Mattamuskeet Lake buttonholed me, obtained the usual cigar, and lectured at me between puffs:

"Got all the eyes men ever owned, or will own through all past and future eternity, have you? The next time you mar an article with one incorrect statement, just decide beforehand to hold ahead before you shoot. You got your bird, all right, but you should hit through the head. Yes, I know, we shot mallards at Kitty Hawk, members of the same group, and in one we found seeds of the cloudberry that don't grow south of Labrador, and in another seeds that only grow in South America. Those birds had met from Great Bear Lake and from Argentine in two days or less; must have used telepathy, and invited each other to a little wild celery lunch day after tomorrow on the outer North Carolina coast. Yes, they were no doubt awful tired after all that flight of say 2,500

or 3,000 miles each; and the groups had sentinels out, all right, bad luck to them! But those are not really abnormal conditions. Just suppose that at the luncheon they had gone on a little spree in honor of their meeting, and had ventured to eat some roots that would make them drunk, and finally put them all to sleep, for ducks will be ducks, you know. Suppose we go right down there and feed a lot of ducks on rum-soaked wild rice. Why, we could row about and pick the mallards up by thousands, sentinels and all."

All right, ye jokers. Be it so. All ducks sleep soundly until a gun is pointed at them. Then they all wake on the instant. This is especially true when the hunter is in a position where the ducks could not see him if they were awake, and more true when the hunter declares he is *not* a hunter.

L. F. BROWN.

Editor Forest and Stream:

Of course dusky mallards sometimes sleep; yet even when they do, one standing right beside them could not be sure they were asleep.

Very few of mere duck hunters have actually seen a group of these birds when some members of the group were in the posture and repose of even seeming sleep. No group of such ducks fails to have members that are manifestly awake, acting as sentinels, keenly alert and watchful. As this is true of all groups near enough to be observed, it is also true of groups too distant for detailed observation. To find and note an exception to this absolute fact of the constant exercise by dusky mallards of this protection from danger, is in their case an impossible exception to the rule that self-preservation is the first law of nature. It would be like seeing a rock drawn from the earth by the attraction of gravitation. Only those who really know the habits of dusky mallards can realize how absolutely this is true; only such men are entitled to judge. And they will see no falsity in the statement, "No man ever saw two or more dusky mallards that were all actually asleep together."

It follows that those who admittedly have little knowledge of the habits, conduct, and customs of mallards, and who produce no experience by reputable men to prove their denials, are the true dogmatists. Obligated to admit that a statement by Mr. Burroughs about sleeping mallards and "telepathy" has been shown to be so ridiculous as to be pitiful, they hunt for and pounce upon what they hope is a "peg on which to hang a dispute."

Study of dusky mallards at Bird Rock, Magdalen Islands, and around Bay St. Louis and Pass Christian, in Louisiana, must convince sportsmen who have no motive for denying it that no group of such birds all get actually asleep at the same time, leaving no sentinels.

Readers of *FOREST AND STREAM* who may be interested in the habits of dusky mallards, should read Elliott, probably our best authority on web-footed wildfowls, and especially his chapter on the surprising vigilance of the dusky mallards. If they follow this by actual study of mallards, they will come, more and more, to know that to catch even one such duck when isolated and solitary, in an attitude of seeming sleep, is like catching a weasel asleep; and that to find a group of mallards in seeming sleep without sentinels, is like searching for the pot of gold at the end of a rainbow.

A. H. STEPHENS.

Migratory Stragglers.

PASSING through Battery Park the other day I saw a small speckled woodpecker clinging to the bark of one of the trees. He was evidently a migrant that had lost his way or been left behind. The weather being wet and chill, he looked somewhat bedraggled and decidedly disconsolate. On my approaching to get a good view of him, he took wing to another part of the park, where was a congregation of sparrows. These made no attempt to molest him, being doubtless impressed with the size of his bill. The English sparrow dearly loves a scrap, but he is a prudent bird withal.

As I continued on my way I recalled other instances of migratory stragglers. One was that of a crested flycatcher who flew in through my window one morning as I was dressing. Another that of a veery whom I observed perched on my windowsill while a cat on a neighboring fence kept her basilisk gaze fixed upon him. Still another was that of a bluebird crouching low beneath a dripping hedge in mid-November.

Now it would be interesting to know whether these migratory stragglers have lost their sense of direction and invariably perish, or take wing again at nightfall and pursue their southerly course. We may assume that they are birds of inferior strength, but their intelligence may not be inferior. But does it require the collective intelligence or instinct of a flock of birds to engineer a migration, or is one bird alone capable of it?

Whatever may be the answer to this question, it is pretty certain, as pointed out by a learned British ornithologist, Mr. Alfred Newton, that past experience has nothing to do with the directing of migration; that is to say, with the finding of a course. For what would experience be in this case? Simply the memory of landmarks from observation. But how could a bird migrating by night observe the land to any purpose, or what observations could a bird crossing the ocean far from land make which would be of any assistance to it in a subsequent migration? Another thing is this, that the young and the old among migrants always journey apart, and most generally by different routes. This was observed by Temminck and abundantly proved by Gätke (of Heligoland) and others, as noted by Mr. Newton. The young can have no experience, and yet they manage to reach their goal. It is clear, therefore, that a knowledge of signs or landmarks cannot account for the accuracy with which birds steer their course.

Dr. Von Middendorf, a Russian, observed that birds migrating across Siberia were in the habit of steering for the Taimyr Peninsula, the seat of one of the magnetic poles, but Prof. Baird, an American, observed that birds migrating on this continent do not direct their course for the magnetic pole. The question arises, Did Prof. Baird observe long and carefully enough? Magnetic influence is really a most plausible theory, and one fact, at least, which would seem to substantiate it is that birds appear to prefer thick or cloudy nights for migrating, when the electric currents may be supposed to be most active. But even admitting the theory to be correct, it does not

cover the whole ground. For while attraction of the pole might enable birds to find their way generally to the north, it could not, manifestly, enable them to find their particular nesting locations or spots, to which, as is well known, they return year after year.

Altogether, in the words of Mr. Newton, "the whole question is fraught with difficulty, and we must leave to time the discovery of this mystery of mysteries."

FRANCIS MOONAN.

NEW YORK, October.

Some Animals I Have Studied.

XII.—A Cranky Old Horse.

WE possess a small horse which is famous for his eccentricities. He's as great a bundle of contradictions, as many-sided in character as Malt, the trick dog.

He's the first and only yellow horse I ever liked or admired. But though he has certain exasperating ways, he is beautiful, affectionate, and generally lovable. His color is really a bright terra-cotta, with a distinct pinkish tinge, and a dark brown stripe along the backbone. His mane is fine, soft, silky, with a gleam of gold in it. And although he must be twenty years old, or older, his tail is still amazingly heavy and reaches the ground, or would but for its proud outward curve. His eyes are full and bright, his feet so good that the hind ones never need to be shod and the forefeet only about once in a year for a short time. He seems to be as sound, as active, and as gay as when a colt. I have heard that Buffalo Bill (who ought to be a good judge of horses) declares that yellowish or saddle-colored horses with striped backbone average harder and more enduring than other colors. But in my own limited experience, Chass is the first yellow horse without some serious physical fault or weakness. His faults are all in his disposition. If he hasn't a character, a mind, an individuality, then I will own that animals are mere machines.

To begin at the beginning, when we first got possession of him he was the wildest bridle-wise horse I ever saw; more afraid of a man than of anything else in creation, indicating that he had been treated with violence. Indeed, we afterward learned that he had been the property of a gypsy during his "breaking in" days, and that the human brute habitually caught him with the lasso whenever he desired to use him, threw him, and proceeded to nearly "beat his brains out" with a huge club before putting on the bridle. He was about five years old when he came to live with us (I say "live with us," because we have grown to regard him as one of the family, and I would not consent to exchange him for any other horse, nor for a very large sum of money), and we saw at once that he had, apparently, been hopelessly ruined in disposition. Whenever he was wanted, he had to be forced into the stable, and then cornered, and two fearless, active men were required to bridle him. He could not be enticed to follow in. No man could get near him without help. No ordinary farm horse could catch him. But with the help of Malt, the trick dog, whose motto was always "Catch anything or run it off the earth!" (I've seen her catch low-flying quail and other birds, and without hurting them), we drove him into the stable day after day. We have here an excellent, well-watered pasture, and cannot bear to keep any animal tied or shut up. When I first tried alone to bridle him, he retreated to a corner of the stable, squatted like a lion about to spring, trembled like a volcano on the point of explosion, and gave a snort like the popping of a locomotive's safety valve. I hesitated, for I saw that there was great danger of getting hurt, or causing him to hurt himself, for he was crazy with terror. Continuing to apply the most flattering terms I could think of, in the softest voice I could muster, I at last attempted to get near his head, whereupon he violently whirled, struck me with his hip and knocked me in a heap to the further side, then spun about in a most terrifying manner on all fours, on the hind feet, leaping, wildly searching for some place of exit. In spite of my own peril, I trembled for the horse. I feared he might try to break through the wall, or even through the roof. I saw no sign of viciousness—only fear, and a mad desire for freedom. Yet I can truthfully say I'd as soon be in a lion's den as in that situation again. I don't recollect how many I had to call to my help that time. In fact, I was myself conquered, if not broken. But it was Clay, my brother, who finally slipped the bridle on the slippery fellow, who at once became docile, though nervous and shaking still. We found him tender-mouthed, easily led, apparently anxious only to avoid punishment, having no thought of inflicting injury upon us or on any living thing.

Yet there was so much trouble, danger, and loss of time in dealing with him that we were in despair; until our aged father, whom we had not counted on at all, one day came out to "have a look" at the untamed acquisition. He didn't look long until he ridiculed us for our lack of understanding, saying: "Why, boys, that horse will be all right! He is nervous and mettlesome, and has been shamefully abused, but he's got lots of sense, you'll find, and will be kind and gentle when he finds you've got sense enough to know how to treat a horse! In the first place, don't try to jump right at his head. Can't you see that's just what he's afraid of? Some fool's been beating him over the head. Let him know you are not afraid of his other end."

"He's liable to kick," I protested.

"Some folks ought to be kicked!" irritably insisted this venerable friend of horses, wherewith he at once confidently approached the quaking, forbidding-looking animal, saying, "Whoa, Charley, whoa! Whoa, boy! I won't let 'em hurt you!"

"I tell you, pa, he's so violent he can knock you over with his tail," I exclaimed, trying mildly to detain him. Clay also insisted that the beast was dangerous.

"Quit slanderin' that horse," the old gentleman retorted, with a great show of indignation, while continuing to draw nearer the rear of the frightened horse, who seemed truly unapproachable. It was a thrilling moment when he raised one hand to pat him on the hip, while the horse kept crouching lower and lower, and shrinking and shrinking more and more into his corner, but the hand descended, and the horse stood still. Little by little the intrepid old man crept forward, until soon he was patting the glossy neck.

"Now—whoa, Charley!—bring your bridle. There, there, Charley! We'll show 'em what you're good for. Whoa, boy!"

Father saddled the horse and rode him, often far from home, declaring "he's as safe a horse as I should want," and Chass grew so fond of him that at last he would go to him of his own accord, and allow himself to be caught outside. He would stand as still as a statue for the feeble old man to mount, which must have been very trying to a horse so nervous, for father's legs were stiffish, and he was sometimes a long while in getting up, refusing assistance.

But years elapsed before we "boys" could get that horse to stand for us, or allow himself to be quietly caught by us. And in the meantime we were compelled to apply some of the professional horse trainer's tricks to thoroughly subdue him. Once we tied his front feet together and threw him, when he was in a rebellious mood, and he got upon his hindfeet and plunged about in that plight, a magnificent, terrifying spectacle.

When he is angry, though he never seems to desire to hurt any man, he is the stubbornest, most unconquerable equine I ever saw. When good-humored he is the kindest, gentlest, most faithful. A whisper is better than any loud command, a barely perceptible touch of a whip sends him lunging forward. He will pull till he falls. He will go wherever his rider guides, if the rider shows no fear. When he tries to "run away," as he often does, all that is needed to check him suddenly is to laugh boisterously at him, when he at once slows down, and proceeds in a debased, shamed manner, nose close to the ground, sighing dejectedly. This has been the case hundreds of times. No man could, after looking at the sudden change in his manner, doubt that he is ashamed to be laughed at, as was the case with Major, the clown dog. Yet, like that same dog, he delights in provoking laughter when loose in the pasture, and will do the most unheard-of stunts undoubtedly for that reason. He looks as if laughing himself. He will imitate certain of our motions well-nigh as faithfully as a monkey could: such as kicking at an imaginary foe, striking, pretending to drink from a bottle, which he holds firmly between his teeth by the neck, smoking, etc. He has not been trained to do these tricks; he performed each one successfully the first time it was attempted. He's not a conversationalist, like "Clever Hans," but for quick understanding and humor I doubt if his equal exists. He plays with us, with the pigs, with the dogs, with the calves, and is exceedingly careful never to harm any small animal or bird. The chickens are never disturbed by him, even if they eat most of the corn from under his very nose in his trough.

Flora, an old mare, once picked up a large shoat that was trying to get into her trough, and lifted it gently over the high wall of her stall, dropping it on the other side.

Old Bay, whom I had dragging logs for me in a clearing, soon showed that he comprehended my object, so that after starting a log heap he could be trusted to take the logs to it alone, place them alongside, and wait for me to come up with my little load and unfasten him. After the first time he needed no driver to any heap. If a log caught against any small, low stump, he'd look around, hump himself, and lift it over. If the stump was high, he'd give a jerk or two, then pull to the right or left. He seemed to enjoy the work.

L. R. MORPHEW.

[TO BE CONTINUED.]

Another Snake Hunting Dog.

Editor Forest and Stream:

Mark E. Noble, in a late number, gives an account of a snake-hunting dog. When a boy I had another of the snake hunters, a large white bulldog, which I raised from the time he was two weeks old. He was, without exception, the ugliest dog I have ever seen, and his temper corresponded with his looks. I called him Bull.

The most of the snakes that Bull found were black-snakes, but we sometimes found a rattlesnake; and I was always afraid that Bull would manage to find one. That is what he did. He came home one day and laid down on the porch without growling at whoever looked at him, as he generally did. My aunt saw that there was something wrong with him, and called me to examine him; she was afraid of him. I found that he had been bitten on the jaw, and his head on that side had swollen up so as to close the eye. I did not want to lose him, and ran all the way up to an old colored woman's house who had the name of being a doctress. The farmers would call her when in need of a doctor as often as they would call the regular doctor. She came back with me, and on the way down gathered a large handful of a weed that grew in the fence corners, and which we called snakeweed. After bruising it, she boiled it in a quart of milk, and was about to give it to Bull; but I was afraid he might snap at her, and taking the tin pan with this stuff in it, I forced him to drink it all. In a few hours I made another dose of it for him.

He was up and looking for his breakfast next morning, but the swelling did not leave his head altogether for a week. He began hunting snakes again, but took care not to find any more rattlers.

I hunted up the rattlesnake that had bit him, and found he had bitten its head nearly off, then had hammered it into a jelly against a stump. He caught a snake just behind the head, then thrashed it on the ground until it was dead; he sometimes would shake it all to pieces.

Bull met with a peculiar death a year after this. He was lynched for killing chickens. He had got to be so cross that my mother would not let me keep him at home any longer, telling me to kill him or lose him. I could not lose him, and would not kill him; so I took him out to where he had killed the snakes and left him there. He began to kill chickens. He would take a chicken's head off with a single snap, and do it so quickly that there would be no time to stop him. After he had killed half a dozen, my uncle took him out to the timber and killed him.

CABIA BLANCO.

Mountain Goats in the Bronx.

Two mountain goats have been added to the attractions of the New York Zoological Park. They are yearlings, and come from British Columbia.

"Monarch the Big Bear."

Editor Forest and Stream:

Among the advertisements of new books a week or two ago, I noticed the announcement by Scribner's of "an intimate animal study" by Mr. Ernest Thompson Seton. The advertisement said it was Seton's longest and best story, a "return to his earlier method," an "intimate study" by the great naturalist of "Monarch the Big Bear."

For a definition of Mr. Seton's "earlier method," I turned to the introductory note in his "Wild Animals I Have Known," in which he says: "These stories are true. Although I have left the strict line of historical truth in many places, the animals in this book were all real characters; they lived the lives I have depicted." We have Mr. Seton's earnest assurance that he has known the animals he writes about, has observed them with scientific accuracy, and has set down only what he knows to be true. His stories are natural history recorded with literary art—science in an attractive dress.

Eager to read the results of a naturalist's intimate study of so interesting an animal as the grizzly, I obtained a copy of Mr. Seton's new book, "Monarch the Big Bear," and read it carefully. It purports to be the life history of the big grizzly captured for the San Francisco Examiner, presented by Mr. W. R. Hearst to the city of San Francisco, and now confined in Golden Gate Park.

In the dedication Mr. Seton says the epic tale was told to him by two rough men of the hills who did not know how to talk, using words that would be "meaningless without the puckered lip, the inter-hiss, the brutal semi-snarl restrained by human mastery, the snap and jerk of wrist and gleam of steel-gray eye, that really told the tale." He says he gives a translation of their story, "for theirs is a tongue unknown to script."

But there is another "foreword" to the book, in which the author discredits this picturesque dedication, and declares that the story of Monarch is founded on material gathered from many sources "as well as from personal experience," that "the intention is to convey the known truth," but that the liberties taken "exclude the story from the catalogue of pure science."

So the two rough men of the hills, whose crude speech and "brutal semi-snarls" were translated into a "tongue known to script" by Mr. Seton resolve themselves into "many sources" and Mr. Seton's personal experiences with grizzly bears. As I read the book, however, I resolved the many sources into one, and identified one of the rough, inarticulate and semi-brutally snarling mountaineers—the Lan Kellyan of the tale. Almost every adventure and feat attributed to Monarch by Mr. Seton is told in a book, published about a year ago, entitled, "Bears I Have Met—And Others," by Allen Kelly, a book containing Mr. Kelly's plain narrative of the capture of Monarch. Obviously Lan Kellyan is a perversion of that author's name.

Comparing the two books, I find that Mr. Seton has converted Mr. Kelly's facts into fiction, and translated his avowed fiction into "the known truth," and "natural history." Parallel columns would show this clearly, but that method would take too much space, and I will refer to the episodes briefly. In the first chapter Mr. Seton introduces Pinto, a bear introduced in Chapter XVIII. of Mr. Kelly's book, and tells seriously the story of a she bear slapping her cubs when she is shot in the ham, an incident which is related humorously in Mr. Kelly's chapter on "The Adventures of Pike."

Mr. Seton's second chapter is devoted to the exploits of a grizzly that climbed trees after bees' nests. I presume that is one of Mr. Seton's personal experiences, for I do not find any of Mr. Kelly's grizzlies climbing trees. The arboreal habit of the grizzly is one of the hitherto unknown truths of natural history. The credit for discovering it must be awarded to the novelist-naturalist, and it may, perhaps, be placed in the catalogue of pure science. It must be a truth known to Mr. Seton, for chapter three of his book puts the grizzly again up a tree, from which he jumps upon a pestering dog. In fact, in that chapter the grizzly lives up a tree, whereas Kelly and all other unscientific hunters and writers of the grizzly represent that animal as unable to climb.

In Chapter V. Mr. Seton's Monarch climbs out of a corral to escape combat with a bull. That incident is in Chapter XVII. of Mr. Kelly's "Bears I Have Met."

Chapter VII. of Mr. Seton's book is an account of the herding of sheep in a box cañon by a grizzly. It is the identical story that Mr. Kelly in his book tells of the mythical bear Clubfoot. Chapter VIII. continues the same story—Mr. Kelly's story—even to the detail and the very language used in describing the "dead-line" of the bear's well-worn path across the mouth of the cañon to keep the sheep impounded.

In Chapter IX., Mr. Seton tells how a hunter and the grizzly sought refuge from a forest fire in a pool of water, and remained there side by side in a truce of fear. That is the same story told in Chapter XV. of Mr. Kelly's "Bears I Have Met."

In Chapter X., Mr. Seton tells how Monarch wrecked a hunters' camp, tore the tent down and flung it into the fire, and how cartridges flung into the fire exploded and frightened the bear away, while the hunter watched the circus from a tree. Mr. Kelly tells this story as an extravagant yarn, and has fun with it in his chapter on Clubfoot.

Chapter XI. of Mr. Seton's book has its parallel in the previously published Chapter XI. of Mr. Kelly's book, combined with an incident from "The Adventures of Pike," in Mr. Kelly's Chapter VII. It describes a dispute of the right of way between a man and a bear.

All the details of construction of a bear trap, and the behavior of a grizzly when caught in one, as given by Mr. Seton in Chapter XII., are found in Mr. Kelly's book giving the true story of the capture of Monarch.

Chapter XVI. is made up partly of bits from Mr. Kelly's "Chronicles of Clubfoot," in which Old Brin, Reelfoot, Pegtrack, and other notorious marauders are shown to be local variations of the Clubfoot myth. Mr. Seton explains in his foreword that he tells the last two chapters of his story as they were told to him by several persons, including the two mountaineers, and therefore no further parallel is necessary.

What I fail to understand is why Mr. Seton should have pretended that he got his story "from many sources"

and "from personal experiences," and represented his compilation of bear yarns as an "intimate animal study" of his own, when he had previously confessed in a letter, which was printed in "Bears I Have Met," that this "intimate animal study" was another's. In "Bears I Have Met" appears a facsimile reproduction of a letter written by Ernest Thompson Seton to Allen Kelly, in which Mr. Seton says: "Herewith I send the sketch I made of Monarch soon after you captured him. If you tell the public his life as well as you told it to me, it will surely be a go." The letter is dated June 15, 1903. Mr. Kelly's book was published in September, 1903, and Mr. Seton's story of Monarch is published in October, 1904.

Why does Mr. Seton now think it necessary to say that the story of Monarch was told to him by one whose "tongue is unknown to script"? Did Mr. Kelly consent to Mr. Seton's use of his work?

Did Mr. Kelly tell Mr. Seton that grizzlies climb trees after bees' nests? If this book is a "return to earlier methods," are we to deduce that all of Mr. Seton's varied and wonderful experiences with wild animals were warmed-over tales told to him by "rugged men of the mountains, one sentence at a time," with "inter-hisses, semi-brutal snarls," and in language unfit for publication, or lifted from other people's books?

Captain Kelly is one of the contributors to FOREST AND STREAM, and it strikes me that he might throw some light upon these questions, and show us how a great naturalist-novelist makes "intimate animal studies."

JOHN MALONE.

THE PLAYERS, New York.

Monster Toad in "Solid Mineral."

SEATTLE, Wash., October.—Paleontologists are deeply interested in a remarkable discovery made in the coal mines at Renton, Wash., twelve miles from Seattle, yesterday afternoon. In a solid strata of coal an immense toad was discovered. It was alive, but when carried to the surface, 300 feet, lived only a few hours.

Dozens of miners saw the toad, but its scientific value did not appeal to them, and no attempt was made to take accurate observations or even care for the remains after life had become extinct.

The University of Washington has taken up the matter, and an attempt will be made to recover the toad, and collect all possible facts.

If the size of the entombed curiosity has any meaning, it must have been a patriarch, as report has it that a bucket was hardly large enough to contain it.

PORTUS BAXTER.

[The accepted explanation of such occurrences—and there have been scores of reports of them—is that the toad was not in the solid rock, but in a crevice of the rock; and the report that it was in the "solid mineral" was due to carelessness of observation. Successive incidents have been given currency on the simple say-so of workmen, and the "toad in the rock" has become one of the established myths of natural history.]

Deer Prongs and Ages.

JAMESTOWN, N. Y.—Editor Forest and Stream: In your issue of October 22 we notice that Jacobstaff has an article headed "Locked Antlers," in which he says, "the larger buck was of six prongs, the lesser of four prongs, seven years and five years," conveying the idea, as I take it, that the ages of those deer were ascertained by the number of spikes or prongs on the antlers. Such, however, is a popular error entertained by many, as the prongs on the horns show nothing to be relied upon in fixing the age of a buck after its fourth year of age. See works of J. D. Caton on the "Antelope and Deer of America," page 226. Thus the buck with six prongs might have been anywhere between four years and eight or ten years of age.

OLD SHEKARRY.

Sandy Gladstone.

MR. S. MURRAY MITCHELL writes me, under date of October 9, that Sandy Gladstone died that morning. This news makes it seem as though some of the pleasure had gone out of hunting. Always a lover of a shotgun and a greater lover of a good dog, I have often wondered which (gun or dog) would be left at home when seeking the stubble fields and hedges where Bob White lives and loves and hides. Were it necessary to make a choice, really I think it would be the gun.

Sandy Gladstone has not been hunted for the past three or four seasons, as he was only lacking a few months of being fourteen years old when he died. He was by Breeze Gladstone out of Delaware, and was always a credit to his proud lineage. On the bench or in hotly contested field trial, Sandy was never overlooked by the judges, let them be never so critical. But it was his qualities as a gentleman's field dog and field companion that appealed to me, and to anyone who ever had the privilege of shooting over him. A companionable dog, a gentleman himself, you carried yourself better when in his society. Fast, true, staunch, eager, he had a wonderful nose and great "bird sense." Independent, paying but little attention to the other dogs, he hunted his own ground, and he never grew jealous or "hogged," never refused to back, nor can I recall his breaking shot.

Mr. Mitchell has other dogs—several of them; he has owned many before, and probably will own many more in the years to come. It is poor consolation to say it, but I venture the thought that Sandy is the one dog of his life. It is so with all these animal friends of ours. We at some period in our lives secure a horse or a dog that comes closer than any other horse or dog. When we lose this one something is lacking in every other horse or dog that we ever own.

Is not this true?

G. B.

GAME BAG AND GUN

Days with the Wildfowl.—IV.

GERARD and I cuddled down close together in the tall, yellow grass, and while we kept well hidden the approaching line of birds did not give me a shot. As they neared the ridge on which we were crouching they went up into the air just as if some one had told them that it would be a good place to give a wide berth, and they passed on over us way out of range. By the dark streak made by their hooded heads, the glistening white of their bellies and the peculiarly sibilant noise of their short, sharp wings, I knew what they were just as well as I would if they had passed within a couple of yards of me.

"Canvasback!" I ejaculated in response to the kid's inquiring look, as the long line of royal birds rapidly merged into a mere thread in the hazy perspective over Clear Lake.

"Doggone it! That's just our luck," and Gerard kicked spitefully at a clump of soap weed; "if they had been spoonbills or ruddies, I suppose you could have knocked them down with the end of your gun."

"Why, that is always the way, Gerard, with the ducks," I replied, smiling at the boy's acerbity. "It is the canvasback and the redhead and the mallard that tantalize you the most. They are the biggest, the best and the wariest of all, the most desirable and consequently the hardest to get. It is these high-class birds that always fool you, it seems, but you have no trouble with the widgeon, spoonbills, butterballs, and smaller fry. When lying in a blind you seldom miss one of these birds, and, in fact, your doubles are frequent, but it is the canvasback, the redhead and the mallard on which you always miss, or nearly so, and you are not the first young hunter who has learned this disappointing lesson. You see, if diamonds were as plentiful as beans, no one would wear them. However, I don't think we have done so badly. We've killed our share of the canvas and more mallards, by a long shot, than any pair in the party. So we've no kick coming."

We were now slowly puffing up, through the grass and sand, the most commanding ridge of the range, through whose ragged formations were cleft the pass, or passes, in which we had already done such marvelous shooting, and in which we intended to shoot that evening.

It was quite a laborious climb, laden as we were, and on reaching a sort of a circular bench, when about half way up, we halted to recuperate, and as we stood there a reticulation of tiny tracks and trails in the golden sands attracted Gerard's attention, and falling on his knees he bent over to examine them, calling me to come and look.

"The jumping mouse," I remarked, after scrutinizing the lace-like trails and convolutions at our feet and lounging down beside the boy, I told him about them.

"These sandhills are full of these mice, Gerard; in fact, all the sandhills, where there is plenty of soap-weed, are. They seem to haunt the habitat of the cactus, and are really a curious and interesting little animal."

"Once, way back in 1893, the Barrister and I attended one of their dancing parties, one moonlight night, in the hills, back of Racoon Lake, up north of Anse Newberry's. They are great dancers, especially on warm moonlight nights, when it is too bright for the prairie owl and the coyote is not abroad."

"Don't go, Pop, tell me about them; you've got me interested now, and I want to know about them," and Babe grabbed hold of the tail of my hunting coat and pulled me back as I attempted to rise.

"Well—but we don't want to stay here too long, for see, the birds are moving pretty lively off there over lower Hackberry, and they'll soon be crossing these hills. These jumping mice, dear, are found all over the world almost and in Europe, Asia and Africa; they are called jerboas, and in those countries they are somewhat larger than our jumping mouse of these sandhills. They have attracted much attention of those given to observing our smaller animals. The mouse, or mice, that made these tracks can be taken as a type of this whole group as it exists everywhere. It is about two or three inches long, and has a tail fully two inches longer than the body. Its forelegs are but a half an inch in length; the hindlegs two inches. When about to spring it raises its body by means of the hinder extremities and supports itself at the same time upon the base of its tail, while the forefeet are so closely pressed to its breast as to be scarcely visible. It then leaps into the air and alights on its four feet, but instantaneously erecting itself it makes another spring, and so on in such rapid succession as to appear as flying rather than running. It is gregarious—that is, living in colonies like prairie dogs—and builds its castle under these yucca clumps with its sharp little teeth and nails."

"When not in motion this mouse might very readily be mistaken for the common field mouse, as its general aspect is very similar. But to be disabused of this idea all you have to do is to attempt to capture one of them. The force and celerity of its leaps will soon carry it out of harm's way, and you will be astonished at seeing so small a creature, with such little effort, eluding you by covering five or six feet of ground at every spring. When he is pursued by one or two persons and is permitted to advance in one direction, its movements look more like those of a bird than they do of an animal, so high does it leap in the air and so great is the distance it measures at every bound, and so light and quick is its ascent and descent. This cunning little quadruped does not move exclusively in this manner, though, Gerard, for if he did he couldn't weave such a net-work of tracks and trails as these round about us

here. He is capable of running on all his feet with considerable speed, and it is enough to excite the wonder of any one or puzzle them to capture it."

"Do they come out of their castles in the winter time, too?"

"No. When the cool weather comes on, and when the frost suggests an arctic wave, they go into their winter quarters where they lie in a torpid state until the last of April or first of May. They are dug up sometimes in the winter from a depth of two or three feet, I have been told, and are found in a ball of some substance like clay about an inch thick and so coiled into a globular form as to conceal the figure of the animal entirely. But I have never seen an instance of the kind and take little stock in it."

"Nor I. I don't see how they could curl up in this shell of mud, then block up their holes and bury themselves down in the sand two or three feet."

"No, they couldn't. But all the nests I have ever seen were made of long, flexible strands of grass, and so neatly interwoven that no trace of an opening could be found, and how the little fellow contrives to make even such a snuggerly as this, is almost as great a mystery as the clay shell. But we'll come out some day—if we can take the time—and dig one of the little rascals out and look over his fortress at our leisure. See here, the trail leads right up to this clump of soap-weed, then round it, back and forth, several times, and finally disappears underneath this big spike-like leaf; and if a coyote essayed to follow he'd certainly get his nose well pricked. They are wonderfully ingenious in constructing their houses, Babe, and do so with the one idea of safety from their foes—coyotes, skunks, coons, hawks, owls and snakes. The interior is a perfect maze of corridors, chambers, rooms, halls, passageways and galleries, but we'll come out, perhaps tomorrow, and look over one together."

"But it will be a shame to spoil their home," and the boy looked, deprecatingly, up into my face.

"Yes, that's so, but we can't let any little sentiment of that kind interfere with us if we want to learn the mysteries of nature. And then, the family we rout will soon find other lodgings. What about that dancing party? Well, Bill and I were coming into camp one bright, moonlight evening, after a day's mallard shoot up Hay Creek, and as we were resting by the wayside in the hills, where the moonlight poured down in a yellow flood, we saw, off about fifteen yards from where we were reclining, some dozen or so of these jumping mice in one of their nocturnal frolics. They were as funny as they were interesting, and seemed to be going through the evolutions of some sort of a quadrille, whirling around in a circle on their long hindlegs, crossing and recrossing on all fours, and occasionally leaping high into the moonlit air and over each other like frogs in a mill-pond, and all the time keeping time to their comical caperings with fine little squeaks and squeals. Bill and I watched them closely for quite a long time; in fact, until all of a sudden, as if they had become aware of some dangerous presence or caught a taint in the air that told them of some lurking foe—a prowling coyote or hovering night-bird maybe, or it might have been Bill and myself—they vanished like snuffing out a candle. Anyway, there was a sudden, an unusual loud chorus of their tiny voices, a wild scampering, jumping and scrambling, and, as if by magic, every little cavorting rodent disappeared as thoroughly as if they had been absorbed in the moonshine. The Barrister and I lingered and watched, loth to leave a scene so weird, but the little fairies did not come forth again, or emit even the slightest sound to indicate whence they had gone, and feeling as though we had witnessed a revelry of the little gnomes which the Rosicrucians told us of 100 years ago, we gathered up our tired forms and our load of dead ducks and labored on down to our camp back of Newberry's old sod home. But we will learn more about the jumping mice, Gerard, before we go home, so let's hurry on now up into the pass, the birds will soon be moving in earnest, and we do not want to miss any of the flight."

A few moments later and we were toiling up the famous old pass and, finally, all out of breath and puffing like steam engines, reached the top of the range, and the picture that burst upon us was even more entrancing than ever. The broken country to the north and west, with its sandhills rolling like the waves of a golden sea, clear to the reedy shores of Trout Lake, and the placid stretch of blue water to the south, Clear Lake and its outlying companions never looked more picturesque than it did then in the waning light of that October afternoon. But the lad and I were not given much time to admire the grand but lonely scene, for we had hardly caught our breath, when there was a confused stir over Trout Lake and we saw the birds arising in clouds, and a few minutes subsequent they were streaming our way, and the evening's shoot was on.

But why enumerate the events of that night. They were pretty much the same as those of our previous great experience up there, and it will be sufficient to add that we killed all the birds we could carry and more, too. We went through the same trials of chasing cripples, the ecstasy of knocking one with each barrel out of this or that whizzing bunch, time and time again; got a shot, but they were too high, at a flock of five passing Canadas; and then as the sun, like a ball of fire, sank behind the dark rim of the distant western hills, we were treated to a veritable serenade by the coyotes, their greeting to the dawn of night. Off on a neighboring hillside, say a quarter of a mile away, we saw two of these little frowzy nomads of the plains, and while one busied himself digging at some object in the sand, like a dog digs at the entrance of a rabbit's

burrow, the other squatted on his haunches and gave us samples of all the latest songs he had learned and, though chill and creepy and weird as all our surroundings were growing, Gerard and I enjoyed it beyond measure.

And such was our daily life in the sandhills, and while I have said nothing of the badger we saw, the autumn thunder storm we were caught in, the big pelican's battle with the red-tail hawk, the midnight intrusion of a skunk, the blue-gilled sunfish and the sport they gave us on Dewey Lake, the cowboy's story of the haunted ranch, about our numerous haps and mishaps, and our happy hours in the old sod hostelry, our experience with the grouse on our way to Valentine, in the Niobrara valley, and many other little incidents, I have told you enough to give you an idea of the glories and benefits and profits of a two weeks' sojourn in the heart of the tenebrious but always interesting sandhills. There, often have I thought, I would live always in that fresh, free region; that lonely but tranquil realm of content, where honor's measure is not taken by success; where pretension does not tread on merit; where genius is not a jest, goodness not a seeming and devotion not a sham.

SANDY GRISWOLD.

OMAHA.

The Equity of the Game Laws.

BY A. CONVERT.*

GAME laws, like other laws, are made for a definite purpose, and that purpose is a wise one. So much controversy and discussion have arisen over the present game laws of this State, and so many widely divergent views are expressed, that one who is neither a hunter nor a fisherman may be permitted to present what may be called a disinterested or non-partisan view of the question, especially as close contact with friends on both sides has given the writer an opportunity to hear each side of the story, and to study the effect of our present game and fish laws.

It is unnecessary to discuss or even dwell upon the legal status of such laws, when before us is the record of thirty-eight States of the Union prohibiting the sale of game. Supreme Courts have pronounced them constitutional, wise, and just laws; our highest legal tribunal, the United States Supreme Court, adding its opinion to the credit side of such laws, as if to make "assurance doubly sure;" so it leaves only the equity side of the question to be considered. In other words, are these laws fair? Are they based upon the great American principle of giving the greatest good to the greatest number? It is charged that they are tainted with that which is so abhorrent to every American mind—"class legislation;" that is, legislation against the masses and for the benefit of the wealthy, the "favored few."

This is the indictment that rolls so glibly from the lips of the favor-hunting politician, and that flows so freely from the pens of many of our newspaper writers. It is the stock-in-trade argument of many attorneys when "extenuating circumstances" are scarce, and it becomes necessary to give the imagination free rein. Occasionally a Supreme Judge justifies his dissenting opinion by reasoning from such a view-point. Occasionally there is found one, like the late United States Supreme Justice Field, of sufficient mental vigor and moral courage to see and admit the error of his reasoning. He is quoted, since a dissenting opinion written by him in the famous case of *Geer vs. Connecticut* is the Rock of Ages to which other dissenters pin their faith, unaware, perhaps, that Justice Field, in a conversation two years later with his friend E. S. Pillsbury, the well-known attorney of San Francisco, stated that he was "convinced that the doctrine laid down by him in the *Geer* case was not good law, and that he regretted that he had ever written that dissenting opinion."

No one who has given the subject a moment's serious consideration can fail to see the need of placing restrictions on the taking of wild game, both as to numbers and as to the length of the season in which they can be taken. The difference arises chiefly as to the degree of restriction, and there are inequalities no doubt. Our Legislature is confronted with a serious problem when it undertakes the enactment of game laws. Our State is so large and so diversified, the conditions according to localities so varying as to breeding seasons, that a general law—the only remedy at its hands—cannot fit each section to its satisfaction. When a constitutional amendment is added which will permit of dividing the State into game districts, then legislation for the different districts can be enacted. At present the Legislature has as difficult a task as has the Federal Congress in passing a tariff bill that will suit to its satisfaction every State in the Union. Under present circumstances it does the best it can.

Many of those who criticize the restrictions do it thoughtlessly, not realizing that as civilization pushes out and extends its borders, taking up the wild lands, in exactly the same proportion are the breeding ground and habitat of the wild game reduced; that the wild bird flies no faster, has no better means of defense than it had two hundred years ago, while man has increased his efficiency to kill and take a thousandfold, advancing successively from the bow and arrow to a muzzleloading gun, then to the rapid-firing breechloader with smokeless powder and belt full of cartridges, until finally there has been evolved the "Game Hog." Should there be any question about the wisdom of, and necessity for, these restrictions?

The charge is directly made that our legislators were guilty of framing laws in favor of the wealthy, the "favored few;" in other words, were either so base or so ignorant that they passed the present game laws; and the cry was taken up, and is being industriously and persist-

*C. A. Vogelsang in Western Field.

ently circulated by some of the editors in the larger cities and then copied by some of the interior papers who are "long on space," that an "infamous," a "villainous" law was passed, although our Supreme Court declared it constitutional and in no sense discriminating. Surely one has a right to wonder and inquire: why this sharp distinction in terms? Are these laws so unfair? Do they discriminate against the masses? Are the poor deprived of their right, and obstacles placed in their way to prevent their ever tasting game? Is it the poor who clamor so loudly? Have their wails reached the ears and pierced the hearts of these great philanthropists, or is it possible the philanthropic judge and editor have heard that cry at home, and, firmly believing that "charity begins at home," are preparing to receive it? Would it be a fairer, more equitable distribution, to allow the few market-hunters—most of whom are not taxpayers, and often not citizens—to take that which costs them nothing to develop, either in labor or thought; to shoot and ship to the cities where it can be and is purchased only by the well-to-do or wealthy classes? In truth, it is only these two extremes of society, constituting but a small proportion of our population, who are benefited by the sale of game.

It is true that the non-sale of game deprives those living in the cities who do not hunt, but who would buy game if they had the legal right to procure it in that way; but it does not deprive them of the right that any poor man in the country is glad to exercise to acquire his. The city man has that same right reserved to him, and the fact is that all those who at any time purchase game when in the markets have the means and generally the time to acquire it in the same way as the man in the country. In other words, the people who can afford to live in clubs, fine hotels, or swell boarding-houses, are deprived of their easiest way to get game—that is, to buy it. Are these people the masses? Are they the sick, the blind, the poor that our philanthropic editors have in mind? Is it in their interest that this pathetic wail is set up? Have the poor suddenly acquired such influence that they can be heard in these high places; that their cries are heeded when they talk of game laws, but go unheard when they ask for better wages to buy bread and clothes for their families? Selfish interests produce strange arguments.

This does not apply to all who write against the present game laws. There are some who honestly believe that they work an injustice, because they do not understand the subject and follow blindly these clever but fallacious arguments, and because they believe that that which deprives the poor man and favors the rich is wrong. They do not realize that the non-sale of game deprives no man of work or position; that the game-dealer employs just as many men whether it be poultry or game he handles; that the same is true of restaurants, hotels, or clubs; and that in the country the industrious, intelligent farmer who owns a few acres and follows the legitimate occupation of raising geese, ducks, turkeys, chickens, or squabs for the market, and who is generally a man of family, always a taxpayer and a citizen, receives a better return for his products than when game is allowed to be sold. Besides, when he or his sons so desire, they can take their guns (and they always have them), and go out and find some game which has not been shot or scared away by the market-hunter, who scours the country for that which costs him nothing, in order to send it to the comparatively few of the wealthy in the cities who can afford to buy.

They do not realize that the present game laws are to the interest and advantage of such men, and to the disadvantage only of the market-hunter who shoots for the rich. They do not stop to contrast the two types of men, the market-hunter and the poultry-raiser, as citizens; they do not realize that every clerk, every laborer, every business man in the country can have his day afield with some profit and some pleasure; that every mechanic or man employed in business in the city can take a holiday and go into the country when game is abundant and be repaid for his time and expense. They do not stop to think that where one gun and necessary ammunition are sold to a market-hunter, twenty will be sold to men who enjoy hunting, and who will go hunting if there is promise of a fair return. In short, they do not understand that the bone and sinew of our country, represented by the great middle classes, will have an abundance of that which they do not buy, but which they can take in the way they enjoy the most.

It is true that the non-sale means that less game will be killed; that it can, and will, increase and multiply; and in that respect (incidentally) will the rich sportsman be benefited, and along with him will every poor man be a gainer. Indeed, it is doubtful if the wealthy sportsman will be so much of a gainer, since his well-stocked preserve is safe from the market-hunter, who must ply his vocation over that very land on which the poor man must of necessity depend for his pleasure and his share of game. As a matter of fact, many of the preserve sportsmen were against the present laws, because on their lands, over which none but themselves hunt; there was not noticeable the growing scarcity of game, and they objected to the wise provisions that placed a limit on the number they should shoot in a single day—a condition which placed them on the same footing with the man who does not belong to a club or own a preserve.

This brings us to the subject of preserves, and it is one that certain editors, who would like to pose as friends of the poor man, work to a finish. It is one of the subjects they revel in when recounting all the "evils" resulting from a number of wealthy men renting a piece of land, putting up buildings, hiring watchmen and caretakers, and in fact paying quite a sum monthly for the privilege of going several times a season for a shoot. Now this is not intended as a defense of preserves or baited ponds shot over from blinds—a practice that is barbarous! It is rather to invite attention to the fact that game laws have nothing to do with preserves. Will some of the learned judges and great newspaper protectors of the poor point out the connection?

Why tear down the game laws and give still greater advantages and opportunities to the preserve man? There is yet no legal way devised under our system of Government that can prevent a man with sufficient means from purchasing or renting more land if he thinks he requires it, and, after acquiring, controlling it, and saying how much or how little it shall be open to the public. It would seem most unwise and even childish, because of real or fancied grievances against the preserves, that the only

safeguards of the poor man may be torn down, simply because some one must be sacrificed; meanwhile the preserve remains untouched.

To follow out this line of reasoning, we should deny to a person having land that is unproductive—and nearly all shooting preserves are—the right to rent it and receive an income from it. He should open it to all comers; he should be so liberal and broadminded that he must not object if his premises are invaded, his stock wounded or driven away, and his fences destroyed, but sit calmly by—and wait for the tax collector. If he dared lease it to a man or number of responsible men who would take care of it and pay him besides, he would be committing an offense. Why not go a step further and advocate that in a city supplied with street railways on which everyone can ride for five cents, it shall be an offense against the public morals, peace of mind, etc., for any person to ride in any other way!

Another of the arguments frequently used is the pointing out of the hardships and suffering imposed upon invalids who "must" have game and are unable to purchase it. If that has any value, then there should be no close season whatever, no restrictive measures, else all the invalids would die during the eight months of close season; otherwise there are but four months in the year when they could exist, and now even that lease of life by our present "infamous," "villainous" game laws has been swept away. Unfortunately, statistics of the mortality are generally omitted. Is it not a fact that the sick of the masses or middle classes would appreciate a young squab, or the young of any other domestic fowl? Can they not be purchased at all seasons of the year, and as cheap as game (when sold)? Does not that sale benefit the dealer, and also some other man following a legitimate occupation in the country?

Are we not growing more ardent year after year for active, health-giving outdoor life, for the strenuous life in the fields? What greater attraction does the country offer, whether camping or at a country tavern, than the promise of a well filled basket or bag? What resort does not advertise—even when they have it not—its fishing and hunting? Does not that attraction, besides giving new vigor and health to thousands, mean the better circulation and distribution of the city's wealth? Is it not a positive benefit both to the city man and to the brother in the country? The present game laws are accomplishing the purpose for which they were enacted. One has but to travel in the country, anywhere, to see and appreciate the effects. Never in years have the quail and doves been so numerous. Deer are increasing, and there will be plenty for all. And it belongs to all—the people in the country as well as the people in the city. Under the existing laws the greatest good to the greatest number will be accomplished.

"With malice toward none and charity toward all" the foregoing is respectfully submitted, and with hope that a little more serious consideration of all the aspects of the case will show that our present game laws are not only legal but also equitable.

From the Game Fields of Virginia

OVER the frosted fields and down the dim vistas of the tall timber comes the old red warrior, October. Year after year the smoke from his camp-fires veils the forest and "clothes the mountain in its mystic hue." Then we say, "Behold! Indian summer is here." Before this ancient pioneer, lord of the sportsman's world, the red deer falls and the leaves of the sumac bushes are incarnadined in his trail. The glow from the old brave's camp-fire in the chilly evening is reflected from every tree, gold or crimson; through the blue haze of its smoke the hickory shines like a pillar of gold, the maple gleams like a sudden flame.

The little brown rabbit leaps from her warm burrow under the frosty twigs at the approach of his moccasined feet; the thunder of swift-winged quail rises around him as he crosses the broad fields, and all nature seems awed into silence, or, seized with sudden terror, flies at his approach.

At the signal of this friend of huntsmen, every true lover of sport takes down his gun, long unused, tries the triggers, glances down the shining barrels, and then hastens to unloose for a run in the fields his favorite hunting dog, wild for the freedom of the open, the scent of game in his nostrils, the free play of muscles and limbs long unused and cramped. This is the realization of the dreams that have quickened his pulses through all the sluggish summer days—days of weariness and waiting for this!

Hark! to his quick, glad yelp, answering the click of the trigger. See the wild joy with which he sniffs the dark blood stains on pouch and pocket of the old hunting coat, a friend of happier days. Throb for throb his master's heart answers his, as he feels the brown sedge once more under foot, while the frosty branches brush his cheek.

"Steady, there!"

Click! click! Bang, bang!

"By Jove! A double first go! Bring him in, Rip. Good dog! We've not forgotten how!"

And so the hunting season of 1904 opens for many a true lover of sport, both man and dog, and for us at Pine Top Lodge, in the "Old Dominion," where thousands of acres of sedge "old fields" spread before the sportsman's eye that "happy hunting ground" of which the Indian dreamed as heaven.

Here the descendants of old Diomed and Rose, veteran dogs whose histories have been recorded not only on the printed page, but on the "fleshy tablets" of many a heart, keep the memory of these grand dogs green, recalling them, to those who knew and valued them, by their faultless style and sure field work, bringing yearly big bunches of birds to "the man behind the gun," who, tramping home through sedge and broom with swollen pouch and pockets, growing heavier with every weary mile which brings his stiff limbs nearer the deep arm-chair, the blazing open fire, and the ample cheer of the supper of game and hot breads spread in the hospitable glow of the hickory logs, finds compensation for all the sweet toil of the day.

Such is the first day's hunt at Pine Top.

The outlook for game in my section is very good, quail being plentiful, and wild turkey so numerous that it is not

difficult to walk up on a flock of from five to twenty scratching in the dead leaves for acorns, and making so much noise that they do not hear one approach, shy and wary as they ordinarily are. L. P. BLOW.

PINE TOP LODGE, Sussex Co., Va., Oct. 20.

Made in Germany.

LITTLE ROCK, Ark., Oct. 8.—*Editor Forest and Stream:* After reading the very interesting article in the last FOREST AND STREAM on "Antique Arms," I thought that the weapon here shown might be of some interest to the student of firearms. It is certainly not a very old weapon, as it is a center-fire, double-action revolver, but it will doubtless be a stranger to many of your readers. Some years ago, when I was a student in Freiburg in Baden, Germany, it used to hang in a gunsmith's window in that city. Doubtless it still hangs on the same wire; for dressing a show-window is a vanity that the small German merchant seldom indulges in. The drawing is made from memory, and may be in some of the minor details inaccurate, but on the whole it is correct. It consists of a

revolver of about .32 caliber, with a very long cylinder, which is also the barrels. The frame beneath the cylinder is hollow, and contains the main spring. There is no guard, and safety is obtained by means of a trigger which folds out of the way; quite a common device on German revolvers. Fastened to the bottom of the frame is a bayonet about three inches long, which opens by revolving on a pivot, and is held open by a spring. The trigger is placed to one side of the median line of the frame to admit the point of the bayonet when closed. The handle is of metal, about one-half inch thick, and has four holes through it for the fingers. This is hinged to the frame of the revolver and folds up against the bottom of same. In the drawing I have represented it as only partly open; when folded against frame, the whole becomes a very heavy set of metallic knuckles.

LEWIS H. ROSE.

Game Notes from the Northwest Territory.

COL. J. C. McILREE, Chief of the Northwest Mounted Police, who is a thirty-year contributor to FOREST AND STREAM, sends the following notes from that Territory under date of October 5, in which he incidentally recalls the fact of Mr. Charles Hallock's presence at Regina, the embryo capital, in August, 1882, when the first train on the Canadian Pacific Railroad came through. Regina at that time, as Mr. Hallock described it and sketched it, was strictly a canvas town, composed entirely of tents, and had not been officially named, the local designation being "Pile o' Bones," because of a buffalo slaughter which had at one time taken place there. The first wooden building that went up was a livery stable, from which the horses were turned out on Sundays to make way for religious services. A large party of Indians and half-breeds came in with sacks of pemmican from the Athabasca district north, which was probably the last consignment of its kind, as the buffalo were practically cleaned up that winter all over the ranges. Col. McIlree now writes as follows:

"This country is beginning to fill up, and as a consequence big game is getting scarce. I rode some 600 miles in July and August on an inspection trip, and saw quite a few pronghorns. I have had a pleasing occupation this fall teaching my youngster of eleven summers to shoot. I have been coaching him for some years with a .22 till he could shoot well, then introduced him to a shotgun, and this season turned him loose, and he has done well. Out for seven parts of afternoons, he has 59 grouse to his credit, all killed on the wing but two. Birds are fairly plentiful this year. I have only shot close around barracks. I inclose a photo of a moose head one of our fellows brought from the Yukon. It is rather a pretty head, I think. J. C. McILREE."

Long Island Ducks.

EAST QUOGUE, L. I., Oct. 15.—I send the number of ducks shot by guests last week: October 10—3 geese, 10 ducks, 11 snipe; October 11—14 ducks, 2 snipe; October 12—Rain stopped shooting; October 13—6 ducks, 9 snipe; October 14—5 ducks, 7 snipe; October 15—12 ducks, 1 snipe. Broadbills in great number came in the bay October 15. By the 25th battery shooting should be good, as the birds will get a haunt by that time.

E. A. JACKSON.

Death of a South Bay Guide.

ISAAC GREEN, of Bayport, a famous South Bay guide and wing shot, died October 22, aged 78 years. Lockjaw was the cause of death. Mr. Green was credited with having shot more ducks than any man living along the bay. He declared during his last illness that his old-fashioned muzzleloading gun which hung on the wall over his bed was superior to any modern fowling piece.

All communications for FOREST AND STREAM must be directed to Forest and Stream Pub. Co., New York, to receive attention. We have no other office.

Lake Temiskaming.

LAKE TEMISKAMING, Quebec, Canada, Oct. 20.—*Editor Forest and Stream:* As many of your readers have visited the Temiskaming district in search of big game, an account of a hunt on October 17 may interest them. Two guides who were engaged to go with a New York gentleman next day, were here waiting for him to put in an appearance. In the morning I told them they had better go out and try and get some partridge or deer. They left the hotel at 8:30 and in the evening, about 7:30, arrived with a moose head, the horns having a spread of 52 inches, and one of the prettiest ones I have ever seen in this northern district. When returning, within a quarter of a mile of the house, they killed a very large brown-nosed black bear weighing 300 pounds. How is this for one day's hunt in the virgin wilds of Canada? Many of your readers know the guides, Francis Antoine and Bernard Jawbone.

The shooting of the bear was rather funny. Francis was ahead with the moose head on his shoulders. Just as they came out of the bush near the graveyard of a small church near the C. P. R. Railway track, they espied the bear. Bruin evidently thought he had met a moose, for he stopped. Francois halted and gently swayed the moose head to attract his attention, and Bernard with a .35 Winchester bowled him over. When they reached the house, I asked Bernard where they got the bear. He said,

"In the graveyard. I guess that bear was coming from church," and a quiet smile played about his stoic face.

W. H. LEAVITT.

Good Shooting in New York City.

THE New York Herald of October 15 relates that a tract of land of eight hundred acres, which is in reality a game preserve, exists right in New York city. That this is true, Captain Burfiend and the police of the West Chester precinct found out a few days ago, when a request was made at the little station house in Main street for protection from the hunters who are just now beginning to trouble the custodian of the place.

On both sides of Westchester Creek and on the shores of Pelham Bay, not far from the Bartow station on the suburban branch of the New York, New Haven and Hartford Railroad, is what is known as part of the Coutant estate, which consists of about one thousand acres. One lone house, that of John Campbell, the custodian of the place, is within a stone's throw of the little station. Fishing is good, and hunting also, as ducks, snipe and other game abound. Campbell was busy last week warning hunters that no trespassing would be tolerated. The sportsmen usually take Campbell as a joke, and so he appealed to the police of the West Chester station for assistance. Perhaps the most surprised man was Captain Burfiend, for he never dreamed of the possibility of being

asked to help police a private estate of nearly one thousand acres within the confines of the city. He explained that he could not properly protect the place, as he had not men enough. Campbell then said that he would have to use methods of his own, and added that he had several good guns in his house, and in addition would obtain a number of dogs.

The Limit of Game Bags.

SOUTHPORT, Conn., Oct. 24.—*Editor Forest and Stream:* In your issue of October 1, More Anon, in telling of the abundance of water fowl and shore birds in the Currituck region, states that on three days of a certain week in September he shot respectively 135, 122, and 70 yellowlegs. It is gratifying to know that there are still some places on the Atlantic Coast where the shore birds may be found in considerable numbers. But is it not high time for sportsmen to set themselves a limit whether the law requires it or not? Is not a daily average of 109 birds far too great? I would like to ask More Anon if, in his opinion, that first day's sport would have been a failure had he stopped at 35 and allowed the remaining 100 to go on their way? I would gladly be convinced that the supply of these birds is sufficiently inexhaustible to withstand such inroads. Have these or any of the shore birds held their own during the past twenty years? I think not.

M. S. LACEY.

SEA AND RIVER FISHING

A Woman in Waders.

NOW THAT "the high tide of the year" is past, and the season of the log fire has opened, I have been thinking of the pleasure of the departed summer as I gaze into the glowing embers. We all know that there is nothing comparable to the influence of a log fire. Nothing shuts out the material world more effectually than the glow and warmth and beauty of the blazing logs. It is then that the imagination assumes control. We picture in the dancing flames the realization of our hopes. The future is unrolled before us, and we shape events according to our desires. While the spell is upon us we not only map out our lives, we seem actually to live the part. But aside from our flight of fancy toward the future, the flames as they change in form and color turn our thoughts backward, and we live again the red letter days of the past.

There are two experiences of the summer just departed which I love to dwell upon; and it is under the influence of the cheer and warmth of the logs as they burn and crackle these cool October evenings that I seem to experience again those seasons of pleasure and delight.

Yes, unquestionably those days of May and July hold two experiences never to be forgotten, and I fervently hope, very many times repeated. What was it they held? Why fishing experiences, of course.

It seems odd, now that I think of it, that as a daughter of a disciple of Izaak Walton, I should have lived a score and a half of years without ever casting fly on a trout stream.

This suggests the oft-discussed question, "Are anglers born or made?" The venerable Izaak tells us that "as no man is born an artist, so no man is born an angler." But again in his "Compleat Angler," we read that "angling is somewhat like Poetry, men are to be born so." When the father of angling is thus contradictory, what are we to believe. And yet, after all, why bother with the question. If we are "born so" the consciousness of the gift will make itself known, and we will enter the company of anglers with the realizing sense that we are where we belong. If we are not "born so," a few tests on the stream with rod and line will settle the matter. And the question will not be decided by the number of the catch, either.

At the end of my first day the bottom of my creel was covered only with the moss that was to have made a bed for the trout. Was I discouraged? No. That first day's experience led me to believe that I was born an angler, for although I had no trout, there was something in my heart that seemed a precious possession. I had found a recreation which was satisfying, which was delightful, which had no blemish or drawback. Yes, I believe that I was "born so."

This first experience came to me last May. During the previous winter a very frequent and delightful guest at our home spent many evenings with my father in his library before the fire telling "fish stories." Unlike most fish stories, his were all true, and always fascinating, and I found myself becoming extremely interested in the subject of angling as represented by these two lovers of the art. I presume it was my questioning, and my evident enthusiasm of the subject that led them to arrange an early trouting trip, our friend planning to take his wife, and my father to take me.

Those days of preparation are all pleasant to look back upon. Mrs. B. and myself became initiated into the technicalities of the gentle art. Fishing before had suggested a fishing-pole; now we spoke of our rods. We decided speedily that our interest was centered in the fly-book rather than in the bait-box, especially when our imagination filled the latter with various creeping things.

In a recent article by Mr. Fowler in *FOREST AND STREAM*, we have seen set forth the differences between a fly-fisherman and a bait-fisherman or a "plugger." I shall say nothing against the latter now, except that I hope no woman is in their ranks or will join them.

Fancy trying to observe and practice one of the rules for adjusting a frog according to Izaak Walton: "Thus use your frog: put your hook—I mean the arming wire—through his mouth and out at his gills, and then with a fine needle and silk sew the upper part of his leg with only one stitch to the arming of your hook, or tie the

frog's leg above the upper joint to the armed wire; and in so doing use him as though you loved him." Verily frogs, worms, grasshoppers, helgramites, and all the long list of live bait, are not for the use of the angler's wife or daughter.

And yet the question may well be asked, if a woman shrinks from using live bait, how can she experience pleasure in catching a living thing on a cruel hook? My answer is framed from what my father and his friend have told me. They assured me from the beginning that fishes are cold-blooded, and that the hook does not hurt them. I hope I have not been misinformed. But the argument in the matter which would warrant an indulgence of the art, is the fact that fishes were intended as food for man.

It is only fair to acknowledge that from the first contemplations I entertained of becoming an angler, one of the most attractive thoughts was the charm I knew I should find in the country of the trout stream. I did, indeed, anticipate the pleasure of the motion and spring of the graceful rod, but little did I realize the sensations that the actual manipulations would produce. And when the first trout rose! But there, I am going too fast, for I want to say a word regarding our preparations for the trip to Sullivan county, where we were to fish the Willowemoc.

One of the most interesting purchases in making ready for the trip was that of the waders. The gentlemen, of course, as old sportsmen, possessed everything that a devotee of angling could desire, including many devices in the way of tackle that would startle the gentle Izaak were he to appear among us. At last the preparations were complete, and the time of our departure near at hand. A dress rehearsal in our shiny waders, with cloth skirts not very much below the knee, matching in color our blue and green velvet shirt-waists, called forth pleasant compliments from our instructors, and we were glad that the angling habit was not unbecoming.

We reached the little station of Livingston Manor at twilight with no evidences of spring in sight or sound, though we had left the robins and the early blossoms in Jersey. A drive of six miles brought us to the Hearthstone Inn at De Bruce, and a blazing fire and hot supper were welcome, indeed. We all went to bed in good season that we might be ready for the wonderful event of the next day. Early we marched into the breakfast room with waders on, having left our rods, nets, creels, etc., in the hall, where we could speedily grasp them as we made a rush to be off. I was as excited as a child to see its first Christmas tree. Why, I was really nervous, and could scarcely take time enough even to eat some mush and milk. I left my companions with their steak and hurried out of doors. At once the sound of the stream reached my ears—the stream in which I was to wade. Think of it! The stream where lived the speckled trout—the stream that I had been hearing of all winter!

Yes, the bell had rung, the curtain risen, and the test was about to begin. Were Mrs. B. and I "born so" or were we "to be made?"

I refrain from recording the incidents of that first day, the principal reason being that they are too numerous. But let me add that it was a day of great delight. There were no mishaps, no accidents, and no trout; that is, none for me. My friend Mrs. B. hooked and landed two beauties with the grace and art of a professional, thus doing credit to her able instructor. It was a Cahill that did it, I think. My coachman, I presume, is still decorating a stately hemlock; but I noticed that a professor was tight and fast in a limb just above where my fly caught, and a few yards ahead I observed Mr. B. adjusting a new fly. The novice didn't feel so badly after that.

Mrs. B. and I waited with suppressed interest the verdict of our instructors upon our qualifications to enter the ranks of the anglers after that first day with the rod and line. Were we to be or not to be admitted? The big fire-place of the inn was crammed with logs, and we relaxed our tired bodies that first evening before its genial warmth. No one spoke. Finally the stillness was broken by Mr. B., who simply said, emphatically, "Born so." Father echoed, "Born so." We had passed.

It is hard to put on paper the sensations that came to me those three days a-stream; but it is not hard to call them back as I gaze in the glowing embers of the fire.

How much richer the memory is for having had those experiences; I may almost say, how much richer the life!

It is as dear old Izaak Walton has said, that "angling is an employment for idle time, which not idly spent, is after study a rest to the mind, a cheerer of the spirits, a diverter of sadness, a calmer of unquiet thoughts, a moderator of passions, a procurer of contentedness, and it begets habits of peace and patience in those that profess and practice it." True, indeed, is every word, as all those who have tried it will agree.

We returned to the city, each with a rich possession. I do not mean the trout, though we felt a glowing pride in the beauties we brought to those at home. I refer especially to the tranquil minds, the restored vigor of the body, the experiences we shared as companions in the stream, and at the noon-day luncheon on the bank. The purity of the water, of which we almost seemed a part as we walked its rocky bed; the tonic of the air as it came to us from the hills and across the meadows; the song of the birds as they called to one another in the love notes of the spring; the tender coloring of the new growth of the year; all these influences we carried away with us—the influences which are the mainspring of a pure and simple life.

My second angling trip included, as the first, many months of anticipation and also of preparation. Again the principal subject was that of the waders. This time we were going to Michigan to camp as well as to fish. The question was, were our waders going to be high enough for the water of the Manistee River. It was finally decided that they would do, and the boat would be near us if we got in deep water. I confess that both Mrs. B. and myself felt a little uncertain as to the wading we would be able to do, for we noticed that the men bought what looked like a diver's uniform. The whole body was covered up to the arm-pits, and we wondered what we should do, rubbered only above the knee, and with short skirts. The first day in camp decided it.

I left my tent at six with my waders on and short skirt. The men appeared clad nearly all in rubber. Our camp was pitched on the bank of the river, and it was but a step from the tent to the water. I made that step with direct intent. I got only about three feet from shore when I found I was getting in too deep. I searched for a shallow entrance all along the line, but the bank and I were still too close. Then came the question, how could I angle when I couldn't wade? I was sick at heart as I remembered that a drive of thirty miles and a three-hour railroad journey separated me from what seemed essential to my happiness—a pair of high waders.

All this time the men were several bends below in the river catching the trout for breakfast. Upon their return, their solicitous inquiries as to what had happened to upset my peace of mind so early in the game—we had made camp the night before at six—were called forth by my long, and I fear sad, face. My story was scarcely told ere one of the party dashed into a tent and out again with a pair of extra waders. Then some one else dashed into a tent and out again, and I felt as if I were peeking over a high board fence. They were a loose fit, to be sure, but I didn't care about that, or that the size was No. 10. All I thought about was getting in that river and casting a Reub-Wood for those speckled beauties.

My breakfast was about as exciting as the one at Hearthstone Inn before my first entrance in a trout stream, only then I was concerned both with the waders and the casting, and now I felt that my whole attention must be given toward keeping upright in those gigantic leggings, which made me walk very like a performing bear.

That first day is too painful to recall, but I kept in the river until supper time, and then all night I walked the shifting bottom of that river, done up to my neck in rubber.

Well, the second day I fished, and the third day I fished—yes, and caught some beauties, too—and every day of the two weeks in camp, except Sundays, I fished and wore the waders.

What about Mrs. B.? Well, she thought she would stay in the boat, as Mr. B. felt that her 110 pounds (she weighs 50 pounds less than I do) was safer there. The other ladies of the party didn't venture into the high-top boots but once, so I was the undisputed wearer of the extra pair

of waders. They brought me more pleasure, I am sure, than any seven-league boots of the fairy tales could have done. Nothing can equal the thrill of walking down the heart of a river, following the current and your inclination, and being able to place yourself so that the silken fly can dance out on the water beyond you—just over the "dead head" where you wish to place it.

Yes, you know he was there—a big one. At the second cast out he rushes, and in a twinkling the connection is made, and he belongs to you. There is no one near, the boat is waiting around the bend, but you smile as you measure his twelve inches with your eye while you land him. It was the position that gave you the chance. No boat would have answered, the cast would not have been possible from the bank; it was the waders that did it.

So now, as I look into the fire, I see many things which bring back my two angling experiences. I see the surroundings, the charming setting of the scenes; I see the river in its motion; I see the sunlight glisten on its surface; I see the color of the heavens and the fleecy clouds floating by; I see the faces of the friends and companions a-stream; I see the leap of the trout and the rush for the fly—and in the midst of all I see those big, yellow, No. 10 waders.

MABEL WOODWARD.

Impromptu Trout Lures.

Editor Forest and Stream:

Do read the annexed deposition from the "Anglers' Book of Revelations." It hardly sounds like "Truthful James" or John his brother, both of whom were expert fishermen in apostolic times at the beginning of the Christian era. Nevertheless, since it is vouched for (?) in cold type by a journal whose reliability has been fathered by four consecutive generations of trustworthy publishers, will not those who angle be "almost persuaded?" Will not some even swallow the substance of the statement as the untutored trout swallow the new-fangled bait? I copy:

"Something About Trout.—Once, while casting from a canoe, when, at dusk, the night-hawks were very thick, I slapped the flies again and again on the wings of the gyrating birds, and on one occasion dislodged a feather, which, falling to the surface of the lake, was seized by a trout. On another occasion, in Maine, casting at sunset, I hooked a muskrat through the back. The rat crawled up on the bank; the hook carried away a little film of skin and hair without hurting the frightened creature. Recovering, I cast and took a trout on that tuft of hair, which, added to the Parmachene-belle on my leader, seemed to do the work as long as it lasted. Yet, when it was gone, substituting a black gnat with chenille body and head wings, the trout knew the difference, and refused the offer."—Harper's Weekly.

Here, Mr. Editor, is a man, an averred eye-witness to all the idiosyncrasies he recites, who does not have to patronize the tackle shops for artificial flies. Not one cent can the dealers exact for tribute from this independent rodster. He just sits in his light canoe (being perfectly at ease in the ticklish craft), and flicks the feathers out of bull-bats and other birds which flit in the dusk, and snips the fur out of muskrats and that ilk when they are not noticing; does it all with his own little hatchet—I should say with his light fishing-rod—and thus obtains infallible lures for the trout which deploy in the

pool around him, enjoying exceptional success. No other baits or lures will do at all—not even "a black gnat with chenille body and head wings." Intelligent trout recognize the old-time seductions, but are not up to these improved devices which bear the caveat of the wily angler, and only Harper's Weekly had the secret! But this at once became too good to keep, and so was unconscionably published—literally given away to a grateful guild, of which FOREST AND STREAM readers are fortunately members.

Happy the contributor who can thus find his offering "available." For there are many who do not *quorum pars fui*.
CHARLES HALLOCK.

Off the Jersey Coast.

ASBURY PARK, N. J., Oct. 21.—A review of coast fishing is not conducive to extravagant praise as relates to the season now drawing to a close.

Perhaps there have never been more enthusiasts at all the favorite points, and it is safe to assert that disappointment has been the portion of the majority. Striped bass took the hook fairly well for a brief period in June, but left us unusually early, and only an occasional straggler has since appeared. The harvest moon tides usually give us a run of good fish, but the exception was the rule, as only one fish was taken during that period at any of the near-by points.

Kingfish were very scarce the entire season, but those taken were most remarkably large, and in nearly every instance female fish heavy with spawn. There is a most peculiar fact in relation to the spawning of kingfish, as we began taking them early in June with ripe ova, and the same condition prevailed throughout the entire season. I have taken many specimens late in October with ova fully developed and apparently ready to be voided. If the same conditions exist with any other member of our coast fishes I am unaware of the fact.

The man who observes things each recurring season is almost sure to add to his store of knowledge or develop some surprise. In all the years that I have followed salt-water fishing previous to this, I have never taken a spawn-bearing weakfish on the hook, and had discussed the subject with many others, most of whom had had the same experience. As if to emphasize the never-ending vagaries of fish life, out of the first seven fish taken by me the present season, five contained well matured spawn.

We ordinarily look forward to a heavy run of weakfish on the beach during August, September and October; but their movements have been very erratic. Some days fairly good sport was to be had, and the next, when conditions appeared equally good, not a fish would be in evidence. All this, however, relates to beach and pier fishing.

There is another class of fishing which has sprung into universal favor, and it is my pleasure to say that the past few weeks have given me the finest fishing I have ever had on the New Jersey coast. Thanks to those genial surfmen, Brit Slocum and Charlie White, whose knowledge of the briny and the haunts of its denizens no man's excels, we three congenial spirits—Ennis, Crosson and myself—have had many days of supreme delight. While yet the stars are in evidence, after a hasty breakfast, we hurry to the beach. What though the sea seems a trifle boisterous, our surf-boat, equipped with powerful gasoline engine, is launched, and away we go out over the bar, where the breakers are tumbling; but the rapidly re-

volving propeller shoots us through and on to where the long, steady roll assures us there is no flying spray to dampen either our ardor or our breeches. In the early morning light is made out the heavy line of smoke from some passing steamer of the coast lines, trailing back in the yet heavy atmosphere. Toward that we go, arousing from their repose the gulls; and the ubiquitous loon slinks away on heavy wing, wondering perhaps at the noise of the rapid exhaust of our engine and the clatter of human voices.

In the stem of the boat stands the sturdy figure of Brit, his experienced eye taking in the familiar ranges on the rapidly disappearing shore-line. At a signal of his hand, Charlie shuts off the engine, and we come around in answer to the dropped anchor and swiftly paying out cable. Rods and reels are quickly adjusted, and the polished squids are attached to the lines and dropped overboard. Down, down they go, forty, fifty, maybe sixty feet, until they touch bottom, for it is there we seek the quarry. We are fishing for weakfish. After reeling up about three feet, the squid is kept rapidly in motion by continually twitching the rod. If we are on the right spot (and we usually are), very soon the rod, which was moving upward, is rapidly shot downward, until the top is buried far beneath the surface, and an untamed something is entire master of the situation. Under and around the boat it goes, the line hissing through the water. But nature tires, and gradually the conquering reel brings into view the flashing, fighting victim, and if well hooked a helping hand lays the exhausted pugilist in the boat; his weight is 6, 8, possibly 10 pounds, for many of the latter weight have we taken; and regard for his fighting qualities gradually merges into admiration of his splendid changing colors, putting to blush the brightest rainbow that ever graced a morning cloud. Before the first is boated, probably a second and third is hooked, and everybody is busy.

The transition from the sublime to the ridiculous is always easy, and the next to inspect the flashing squid may be of such small size as to draw forth remarks more or less uncomplimentary. Surprise is always in store for the one who pursues deep-sea fishing; it is always uncertain what species will strike the bright metal. I have taken in this manner bluefish, bonito, weakfish, croakers, plaice, porgies, sea bass, whiting, ling, hake and skate. There is always an expectant crowd watching the landing of our boat, to whom the catch is welcome, other than perhaps one or two of the choicest specimens for home use.

Superb fishing, however, has been had by different members of our club who have enjoyed the pleasures of Harvey Cedars.

LEONARD HULIT.

Massachusetts Trout Stocking.

The Westfield (Mass.) Anglers' Club received a consignment of nine cans of fingerling trout from the State Fish and Game Commission yesterday. The trout were taken to Westfield by Deputy Shea, and arrived in prime condition. The cans contained fully 2,500 trout of unusual size. They were exceedingly lively. Members of the club placed the fish in several different streams. The trout are all large enough to take care of themselves, and through the winter and spring should grow to good size. The Anglers' Club is doing good work stocking the streams, and should be more generously supported by the sportsmen.—Springfield Republican, October 22.

YACHTING

Cruising in Nova Scotian Waters.

BY S. J. ALLEN.

THE several cruises described in this article were made during the months of July and August of 1903 along the southwestern coast of Nova Scotia, from Halifax to Shelburne. I made my headquarters at Chester, which is situated on Mahone Bay, about forty-seven miles west of Halifax. Mahone Bay is the most ideal yachting ground one could wish for, it is about eight miles wide at the mouth. Across the entrance stretch the islands of Big and Little Tancook, which form a natural breakwater for the waters within; dotted over the bay are about one hundred islands, large and small, most of them clad with green trees to the water's edge. Chester is located at the head of the bay, and is a great summer resort for American tourists. There is a small but enthusiastic yacht club there, which holds races every Saturday and an open regatta once a season.

The yacht Menotah, in which these cruises were made is a 24ft. waterline, centerboard sloop. Her over all length is 33ft., and her breadth 9ft. 10 in., with rather high freeboard. She was designed principally for cruising, but a fair turn of speed was expected. Her hull is strongly constructed of oak and pine. The ballast consists of about 1,400 pounds of lead hung outside in a long shoe, through which the centerboard passes, and about 1,200 pounds inside. The 800 sq. ft. of sail is divided into the mainsail and one jib. The mainsail has three sets of reef points, and a storm jib is used when the last two reefs are tied down. The cabin is about 10ft. long, with 4ft. gin. headroom, and is finished in cedar and oak. On each side of the cabin there is one berth with a transom in front, giving sleeping accommodations for four persons. On each side forward of the berths are placed lockers for stores and dishes. Forward of the cabin is a galley with a small cast iron wood stove.

The question of stoves aboard a small yacht is a very perplexing one, some preferring one kind and some another. Having tried all kinds of oil and blue-flame stoves, I have given them up in disgust and have finally decided on the wood stove, such as is used by the coast

fishermen in their boats. One is always certain of a good fire with this kind of stove, and it cannot explode. I use as fuel old oak cask staves, which, when cut up into short lengths, make a beautiful clear fire and scarcely any smoke. Our nights are often cold, and the genial heat given out by this little stove adds much to one's comfort.

Menotah has proved herself to be a fine sea boat, and fast on a reach or a run, but not so good to windward. She sags off to leeward a good deal, not having sufficient lateral plane. I am seriously thinking of taking out the centerboard and substituting a keel, being convinced that a keel boat is far more preferable for Nova Scotia waters.

For some time I had been contemplating a trip to Halifax, and as there were two yachts in the harbor also bound for that port, we decided to make the trip in company. I was only able to get one companion to go with me, and so was rather short handed. The other two yachts were Hermes, from Yarmouth, N. S., formerly champion of the Massachusetts Y. R. A. 25ft. cabin class; and Marion, from Boston, another 25-footer.

The day of departure dawned beautifully clear and bright, with a strong N.W. wind blowing, which later on increased to half a gale. However, as the wind was off shore, and as our course would be before the wind, we decided to start. We tied down three reefs and put on a storm jib. Our dinghy was rather heavy to tow, so we gave her plenty of line, as we knew there would be some long seas running when we got outside.

Hermes got away about twenty minutes before us, while Marion started at the same time we did. We let go our moorings at 10:30 A. M., and beat out to the mouth of the harbor, rounded the point and squared away before the wind. Getting the full sweep of the wind, Menotah sped across the bay toward Little Tancook, for we had to pass between this island and the mainland.

We soon reached Tancook Island, passed between it and the mainland, and emerged upon the open sea, where we got the full force of the wind and sea. Three miles from Tancook lies Ironbound, which name it well deserves, for it looks like a great block of iron rising abruptly from the ocean. There is a powerful

coast light placed on this island, and about 1½ miles E. by S. from the island is an automatic buoy, which enables one to pick up the island in a fog. On our port hand opened out to the N. St. Margaret's Bay, which is nearly as large as Mahone Bay, but more exposed to the sea. We had some trouble keeping our dinghy from ramming Menotah's stern, and as a safeguard we bent on an extra tow rope.

From Ironbound Island it is a straight run of 24 miles to Sambro Island. At 1:30 P. M., we passed Betty's Island, on which is a lighthouse showing the entrance to Prospect Harbor. This island is just half way to Halifax, and so we had been traveling at a pretty fair rate of speed. Marion had gradually drawn away from us and was now about a mile in the lead. We were, however, closing up on Hermes. We passed Pennant Point, which runs a good distance out into the sea in a series of long reefs. The outer reef is marked by a red cone buoy, and about 1½ miles out to sea is placed an automatic buoy. It being a fine day and having fair wind, we ran through the Sambro ledges. This is one of the worst places along the coast, and very dangerous in thick weather. Sambro Island lies about 1½ miles from the mainland and is surrounded on all sides by rocks and reefs. On the island is a powerful coast light, and a fog gun, discharged every two minutes in thick weather. The channel through is deep enough and safe in fine weather to one who knows the way. In thick weather very few will venture through this way. Opposite Sambro Island is a fine anchorage known as Sambro Roads.

From Sambro Island to Chebucto Head, at the entrance to Halifax Bay is 5 miles; and we soon covered this distance after rounding the head, on which there is a light and steam fog whistle. We trimmed sheets and headed up the bay. The land along here is very high and steep, and in the hard puffs Menotah heeled down until the cabin house was in the water. We kept her to it, however, and only luffed once on the passage up the bay. The harbor of Halifax is an easy one to enter, being well buoyed and marked. A course N. from Chebucto Head brings one straight up the harbor. We arrived at Halifax at 4:50 P. M., and anchored off the Royal Nova Scotia Yacht Squadron club house. Having made the trip up in 6h. 20m., an average of 7.2 knots

per hour, Marion arrived 20m. and Hermes 10m. before us.

The Royal Nova Scotia Yacht Squadron is a very flourishing organization and numbers among its members some of the finest yachtsmen in Canada. They are most hospitable to visiting yachtsmen, and we were accorded the best treatment and had the use of their club house and floats.

We spent four or five days very pleasantly in Halifax, visiting friends and sailing around the harbor. Halifax is an interesting old city, strongly fortified and garrisoned with two regiments of British troops. The harbor is noted as one of the finest in the world, being very deep. It is apt to be squally there with a W. or N.W. wind, and one needs a pretty stiff and able craft in order to have any comfort. Above the harbor and connected with it by a narrow passage lies Bedford Basin, extending about 10 miles inland, in which the entire British navy might lie sheltered.

Friday we started back to Chester; the morning was clear and bright and gave every promise of being a fine day. There was a light breeze blowing from the S. as we broke out the anchor and got under way. This would make a beat to windward to Chebucto Head and then a reach along the coast to Chester. Everything went well until we were near Chebucto Head, when the fog, which had evidently been lying off the coast, drifted in, and in a few minutes we were in the thick of it and all view of land blotted out. We ought to have put back into Halifax, but we decided to keep on, as we wished to get back to Chester that day if possible. We did not dare to attempt to run through the channel as we had done coming up, so had to beat out around Sambro Island and the outermost ledges. This meant adding about 5 miles to the course and was attended with some risk. We had to run close to the reefs before we could see them, or hear the steam whistle on Chebucto Head. After a time we picked up the fog gun on Sambro Island. One by one we rounded the ledges, most of them being marked by spar buoys. In passing Sambro Island we got almost into the breakers before we could tell where we were. The fog lifting for a moment showed us to be right under the lighthouse, and just then the gun went off. We tacked quickly and headed out to sea, after a while picking up the Blind Sisters, on which there is a bell buoy. This was the last ledge, and from here we set our course by the compass to Pennant Point. The wind only came in puffs as it generally does in the fog, and we made little headway. We passed close by several fishermen and a couple of large schooners bound for Halifax. Our fog horn was sounded constantly. Land was finally made a little to the E. of Pennant, and after tacking out to sea sighted the buoy off Pennant Point. From here we set our course for Ironbound, being able to fetch it close hauled. The course was now straight, and there would not be much more danger.

About 5 o'clock in the afternoon we ran close by Betty's Island, making it out dimly through the fog. The wind had now dropped very light, and all hope of reaching Chester before dark was given up. At 7 o'clock we judged we were somewhere near Ironbound, although we could not hear the automatic. In another half hour we heard the sound of surf on our starboard hand and, shifting our course, soon made out Ironbound. We had run about a mile off our course and had passed to the south of the automatic, which we were unable to hear, on account of the wind carrying the sound away from us. We sailed close in toward Ironbound and rounded the northern end of it. It was now almost dark and the light on Ironbound could be seen dimly through the fog. The automatic could now be heard plainly behind us, and we did not lose sound of it for the next half hour. We shaped our course for the middle of the channel, between Little Tancook and the mainland. The sun had now set and it became very dark. My companion was forward, keeping his ears and eyes open for any sign of land.

Everything was soaking wet from the mist, and we were cold and hungry. Suddenly, dead ahead and to the starboard, we heard the roar of surf, but could not see any land. On trying the lead we found we were getting into shallow water. I swung Menotah around at right-angles to her former course, and in a few minutes we heard the surf again directly ahead. This seemed very queer at the time, for, supposing we were in the channel, on changing our course eight points we ought to have had to sail over a mile before reaching the opposite shore, whereas we seemed to be in a *cul de sac*. There was nothing to indicate whether we were to the right or left of Little Tancook. After sailing around in a circle three or four times and narrowly missing a big rock, we decided the best and safest thing to do was to anchor and wait until morning. The sea was comparatively smooth, with the exception of a long ground swell, and we would not be in much danger, unless a heavy breeze sprang up, which was not likely. Feeling our way in with the lead until we were in 4 fathoms of water, we let go the anchor and lowered the sails. The lead showed a hard rocky bottom, but our anchor was a good one and we held all right. We fixed up things on deck and then went below. Making up a good fire we soon had the little cabin warm and comfortable, after which we got something hot to eat. What a difference that little stove made to the cabin and to our tempers. After a smoke, we turned in and slept soundly until morning.

When we went on deck the next morning we found the fog clearing up, and we were soon able to make out our surroundings. We saw that we were in a sort of small half-moon shaped bay on the mainland and directly opposite Little Tancook. On the night before we must have kept too much to the starboard coming in from Ironbound and so missed passing through the channel. About 6 o'clock we hoisted sail and started with a light wind for Chester, which we reached in about two hours' time, and picked up our old mooring.

After spending a week in Chester, we concluded one morning to run over to Bridgewater, which is situated on the La Have River, about 12 miles from its mouth, the river being about 25 miles from Chester.

We left our mooring about 10:30, swinging full sail and with a nice wind blowing from the S. The day was beautifully bright and clear, and the sun was dancing

merrily over the waves. Our course gave us a dead beat to windward of about 12 miles to East Point and then a close reach along the coast to the westward. When within 2 miles of East Point the wind shifted to the S.W. and freshened somewhat, giving us more windward work. We rounded East Point at 1:30 and stood over toward Cross Island on the starboard tack. Cross Island lies about 2 miles to the S.W. of East Point, and on the N. and E. sides are several bad shoals. There is a deep channel lying close to East Point, though in bad weather vessels generally pass outside the island. On the island are two powerful coast lights, which are in range with that on La Have Ironbound to the westward; if these are kept in line, all shoals are cleared in that direction. We tacked close in under the N.W. end of the island and on the next tack stood across Lunenburg Bay toward Rose Head. The land here is very high and rises sheer from the water. We stood in close to land, the water being very deep, and, coming about on the starboard tack, ran out to sea for about 3 miles. When we saw that we could make La Have Ironbound on the next tack we came about near the automatic buoy which lies about 1½ miles S.W. off Cross Island. We passed near here a number of fishermen in boats attending to their nets. This is a great spot for mackerel, the men often making a stop of several hundred barrels in one trap. The wind still held true and strong and we were making good headway. Half way between Cross Island and Ironbound is a great rock, which is marked by a red buoy. Keeping the lights on Cross Island in range with that on Ironbound clears this obstruction.

We reached Ironbound about 4:30 in the afternoon. It lies about ¼ mile from the shore, between which there is a deep channel. The island looks very much

MENOTAH.

like the East Ironbound Island already mentioned. Passing through the narrow channel we eased off sheets and ran down the bay toward the mouth of the La Have River. The scenery around here is very fine; great high cliffs sloping back from the water and covered with trees and green fields, cosy farms nestling in the hollows. The mouth of the river is quite narrow and is obstructed by a sand bar, through which there is a channel marked by stakes. A harbor light on the left bank guides one in at night. On the point are the ruins of an old French fort, which must have been very strong and massive judging by the remains. An old French settlement, called St. Jean, stood here. A few of the descendants of these early settlers still live around there and at Petite Riviere, a little further along the coast. A great majority of the people are of German descent, and still retain many of their old customs. They are a very thrifty race and keep their attractive little farms in fine condition.

We slipped by the mouth of the river at 5:30, and as the wind still held, we decided to keep on as far as we could before dark. Just inside the entrance the river widens out into a magnificent roadstead, with Getson's Cove on the left-hand side and Ritchey's Cove opposite. This river, which is justly called the Rhine of Nova Scotia, is navigable up to Bridgewater, which town is about 12 miles from the mouth.

As we headed up the river the scene that unfolded before our eyes would have delighted any artist; the sun, slowly setting over the western hills, bathed the whole landscape in a golden light and threw into deep shadows the western bank. On either side stretched the rolling hills, with their green fields and well kept farms. Along the banks were many small settlements with their wharves and fishing nets spread out to dry. The water is deep and very little current, the channel lies well in the middle of the river. We anchored for the night about a mile below Bridgewater, for at sundown the wind dropped completely. We drew in toward the right bank and anchored in a quiet cove, overhung by large pine trees. After supper we sat on deck until late, smoking and drinking in the balmy night air.

Next morning we rowed up to Bridgewater and had a stroll around the town. Bridgewater is a prosperous little hamlet, prettily situated among the hills. After lunch at the hotel we came back to Menotah and sailed down the river to Ritchey's Cove, where we stayed for the night. The wind was blowing heavy from the W. and we tied down one reef in the mainsail and started. We moved along very fast, and after we got down the river a piece, we found the wind blowing heavier from the S.W. and we had all the sail on we could handle. Several times the squalls from the hills laid us down to the coamings. As we came near the mouth of the river, we encountered a heavy cross sea; but a few minutes more and we were in the quiet waters of Ritchey's Cove, where we anchored. We rowed ashore

and strolled around the place. Great quantities of fish were spread out to dry, which were anything but sweet smelling. The people around here all seemed very prosperous.

Next morning dawned gray and cold and did not look very promising. However, at 8:30 we got under way, putting one reef in the mainsail. The wind was S.W., and blowing a good breeze. We beat out through the mouth of the river, and a close reach took us close to Ironbound. Here our old enemy, the fog, shut down again, and in a few minutes we had lost all sight of land. We had taken our bearings correctly and reached Ironbound all right, passed through the channel just able to make out the land on either side. We laid our compass course for Cross Island so as to take us close by Mid Rock. In about twenty minutes we made out the buoy on our starboard bow. A short tack took us around it and we then headed again for Cross Island. In about an hour we heard the automatic buoy on our starboard quarter and a few minutes later sighted the surf on Cross Island dead ahead. We ran in close to the shore, and skirting the land until we came to the N.W. end of the island, and then shaped our course for East Point. We were now running through a pretty dangerous part and had to be very careful. The wind had freshened, and we were making fully 6 knots and going directly before it. Suddenly I saw directly ahead and extending clear across our bows a black reef just showing above water. We were not more than 200 feet from it, and there was only one thing to do, and that was to gybe as quickly as possible, though it was rather risky in the wind that was blowing. I swung her round like a top, the main boom swinging over with tremendous force and putting a great strain on the sail and rigging. Fortunately nothing parted, and we soon drew away from the reef. We had evidently run in a little closer to East Point than we wished to do again. Soon afterward we made Little Duck Island and, rounding it, set our course due N. for Chester.

After sailing 3 or 4 miles the fog began to lift and soon the sun came out bright and we could see Chester in the distance. With an increasing wind we flew along and reached our moorings about 1:30, being just five hours in running the 28 miles from Ritchey's Cove.

I had for a couple of years been trying to get away for a cruise along the coast as far as Shelburne, but had not succeeded. This year I was determined to go and got everything ready to start on July 27. I had great trouble in getting a crew, as all my friends found at the last minute that they could not go. I finally succeeded in getting one chap to accompany me. Getting all our stores aboard we set sail about 4 P. M. on the 28th, intending to get as far as La Have that night. As it was moonlight we would have a pleasant evening sail.

The wind was blowing fresh from the N.W. when we started, and we ran along in good style, reaching Little Duck Island about 6 o'clock, when the wind dropped suddenly and left us becalmed. In the next two hours we drifted along a couple of miles and were just off East Point at dark. About 8 o'clock the night breeze struck in from the sea. We tacked close in under Rose Head, and then headed out to sea until we had the two lights on Cross Island in range with that on Ironbound, when we tacked and headed for Ironbound light.

About 10 o'clock we reached Ironbound Island and passed through the channel into La Have Bay. Here the wind failed us and we had still 5 miles to go before reaching the mouth of the river. My friend now turned in, and I kept watch until midnight, when I aroused him and went below myself. We were drifting slowly along, and when I came on deck at 2 A. M., we were about ½ mile from the mouth. Here the current was so strong that we were not making any headway, so we anchored for the rest of the night.

In the morning we hoisted our sail as soon as the wind sprang up and sailed into Getson's Cove, where we anchored. It began to blow very hard and at noon had reached half a gale from the S.W. We did not attempt to go outside, but under a three-reefed mainsail sailed around the river, enjoying the scenery. Near the mouth of the river we got a sudden squall which hove us well down. I have never yet taken water into Menotah's cockpit, though she has been on her beam ends once or twice. The wide stern lifts her as she heels and prevents her from settling. She never loses her headway and comes up quickly as soon as the jib is slackened off. We anchored for the night in Ritchey's Cove. The wind shifted to the S. E. about 7 o'clock and increased steadily accompanied by rain. We put out our second anchor as a precaution, though the bottom was good holding ground.

The next morning the wind and rain had ceased, but a thick fog hung around and prevented us from starting. We loafed around all day reading and smoking, and whiling away the time. In the evening we went ashore and called on some friends. Coming back to Menotah we had great trouble in finding her, as we could not see her light until close up. After rowing around in a circle several times, we at length got on board.

Next morning the fog lifted and the sun was shining brightly. There was a light breeze blowing from the S.W., and we got away about 9 o'clock, intending to reach Liverpool that evening if possible. We had made about 4 miles when the wind died out and we lay becalmed until 12 o'clock, when a fresh breeze came up again from the S.W. and we were soon bowling merrily along. This wind would make it all windward work along the coast, and it looked very doubtful if we could reach Liverpool before dark. We could, however, run into Port Medway this side of Liverpool. On the first tack we stood out to sea about 4 miles. As soon as we were out of the shelter of the land we found the seas very heavy, a reminder of the recent gale. The wind had freshened, and we were soon pitching into it in fine shape. However, under a single-reefed mainsail and a storm jib, she was riding the seas splendidly, and she was not taking very much green water over the bows, though she would put her bowsprit clean under at every jump. The large jib which was furled along the bowsprit got partly loose and forming a sort of bag which soon became filled with

water, which put a heavy strain on the bowsprit. We both tried to clear it, but could not succeed, as it had jammed in such a way that we could not shake it out, so we had to leave it alone until we should get into smoother water. Fortunately it did no harm beyond bending one of the bowsprit spreaders.

On our next tack we ran close by Cape La Have, a bold cliff of white granite jutting out into the sea. About ½ mile off from the cape is a nasty reef called Black Rock, on which the water always breaks. We held on this tack for a long time passing inside Indian Island, which made the water smoother for a short while. We tacked well in under the western shore, where the wind drew more from the W. Again we stood out to sea some 3 miles, finding the sea still very heavy. A long tack was then made in toward the shore again, fetching well into the middle of Hell Bay. This place well deserves its name, for a nastier spot one could not imagine. On this occasion the surf was breaking heavily on the reefs and we did not venture far in. Our next tack seaward brought us to the mouth of Port Medway Harbor, and rounding the stone house, raced into the harbor, the following waves nearly sending our dinghy on board several times. We ran into the mouth of the Port Medway River and anchored in near shore. Port Medway Harbor is formed by a long line of small islands and reefs running parallel to the shore, which make a long narrow bay. The Port Medway River enters one end of it, and the town is built at the mouth of this river. There is splendid salmon fishing in the river in the spring, and trout may be caught at any time. There is a lighthouse at the mouth of the harbor and one at the mouth of the river. It is a dangerous harbor to enter in thick weather. We were quite tired out after our rough afternoon's sail and after supper we turned in early, intending to make an early start the following day.

There was a nice breeze blowing from the N.W. when we came on deck the next morning. This would carry us well along the coast if it did not shift to the W. We left about 6:30 A. M., and ran down to the entrance of the harbor. The air was clear and fresh and everything promised well. We soon rounded Frying Pan Island, giving it a wide berth, as the chart showed some reefs lying off shore. We were not acquainted with this part of the coast and had to rely solely on our charts, which, by the way, we found to be very accurate. Ahead of us now opened out Liverpool Bay, a magnificent stretch of water without a shoal or reef in it. Coffin Island, lying across one side of it, offers protection, behind this island there is a fine shelter in bad weather. On the island is a large lighthouse which can be seen a long distance off. The wind had now freshened, and we were making about 6 knots on an easy reach. There was a number of fishermen out in their boats, who hailed us pleasantly as we passed.

The scenery all along the coast hereabouts is very fine, high cliffs rising from the water and pierced here and there with long narrow harbors running inland. Past Western Head opened up Port Mouton, which is another fine sheet of water. Mouton Island lies across the mouth of the bay and forms a fine roadstead behind. We next passed Point Joli and then Port Joli. About 2 miles off the coast lies the small island called Little Hope—nothing more than a pile of rocks and sand, with a dangerous shoal to the W. of it. There is a powerful light placed on the island, and an automatic buoy on the shoal. It was now about 10:20 and we had made about 22 miles, so we had good prospects of reaching Shelburne before dark.

About 11 o'clock the wind dropped a good deal and we were not making more than 3 or 4 knots. Passing by Port L'Herbert and Sable River, we came up to Rams Island about 2:30 P. M. This island lies about ½ mile off from the mainland, and there are some bad reefs on the outside of it, so we decided to run inside and thus save considerable time. The chart showed water enough, though there were some rocks and shoals marked. We passed through safely and entered what is called Rugged Harbor, which is a dangerous place and the scene of many wrecks. Reefs and rocks could be seen in different directions, but the chart showed plenty of water between them.

The wind now shifted to W. by S. and began to blow hard. This made it all windward work to Shelburne, about 20 miles away. We made a tack in toward the land, passing close by Gull Rock, on which there is a lighthouse. On our starboard hand we could plainly see the town of Locke's Island, connected with the mainland by a long sand beach. Our next tack took us close by Western Head into Shelburne Bay. Here we got the full force of the wind as it swept across the bay and also a heavy choppy sea. We had now more sail than we could swing, but it was almost impossible for us to reef her where we were, so we had to lug it along as best we could. I gave the jib a good full and slacked the main sheet, keeping only the after part of the mainsail full. As the squalls struck I let her take them until we had good headway on, then eased her up until the squall passed over, always keeping her going. The boat was throwing spray constantly, which blew back into our faces and made our eyes smart.

Things didn't look very cheerful; a 12-mile thrash to windward before we could reach shelter, but we were determined not to turn back. Slowly we fought our way across the bay, making long tacks. First toward Green Island and then across to McNutts' Island, just fetching past the lighthouse on the latter. Under the island the wind was very squally cutting the tops of the waves and dashing it into our faces. Our boat was behaving well, however, and we no longer had any anxiety. We were now in the entrance of the harbor, which is about 7 or 8 miles long and from ½ to 1½ wide. The shores are steep and rocky and the water very deep, and each time we tacked close in shore in the smoother water. Three miles farther up we rounded Sandes Point, from which it was a close fetch up the harbor to the town. There is a lighthouse at Sandes Point.

We flew along, the lee rail buried, and the foam curling up to the washboards. We were just 30 minutes doing the 4 miles from Sandes Point up to the anchorage. We dropped our hook about 7:30 off the wharves and alongside Princess, a large yacht from Halifax,

which had arrived 3 hours before us. She had carried away her main boom goose-neck in one of the squalls under McNutts Island. We were indeed glad to be safe at anchor once more. Our faces were encrusted with salt, and my arm was aching from holding the tiller so long. We turned in very early, completely tired out.

Next morning we spent calling on our friends and getting acquainted with the town, which we found to be a quaint, picturesque old place, full of reminiscences of its former greatness. Shelburne was settled by the United Empire Loyalists, who came over during the American Revolution, and for a time was a very important city, rivaling Halifax, the capital. The Loyalists built great oak-framed houses, many of which are standing to-day. After a time, however, the population gradually dwindled away and the place languished. Much ship building is done there now, and Shelburne turns out some of the finest schooners in Canada.

The people were extremely kind to the visiting yachtsmen and gave a ball in our honor and several other functions. There were two races for the Shelburne Cup, and they were both won by our old friend, Hermes, by a narrow margin from the Princess. This latter yacht is a new 30-footer, designed by Mr. B. B. Crowninshield, of Boston, and built in Nova Scotia. The wind on both days was light and just suited Hermes with her large sail spread. We started, but were out-classed by the larger boats in the light wind. We were beaten in the first race 4m. by Princess and 8m. by Hermes.

We spent a week in Shelburne, sailing around the harbor and enjoying ourselves generally. We left on Saturday, Aug. 7, with a nice N.W. wind blowing, which carried us along at a smart clip until about 4 o'clock in the afternoon, when it died away, leaving us becalmed off Port Mouton. About 7 o'clock in the evening a fresh breeze sprang up from the N.W. and we decided to make Liverpool that night. We ran past Western Head, and beat up the bay toward the mouth of the Liverpool River. We reached Liverpool about 9 o'clock and anchored just inside the bar. There is no harbor at Liverpool worth mentioning, and vessels have to lay at the wharves.

Next morning we went ashore and had a walk through the town and found much to interest us. We left Liverpool about 10 o'clock for home. The wind was from the S. and very light. After beating out past Coffin Island, we slacked away sheets and slowly ran up the coast. We reached Cross Island about 6 o'clock, when it clouded up and soon began to rain. We were now in familiar waters and had no difficulty in finding our way into Chester, which we reached about 9 o'clock.

We had been away nearly two weeks and had sailed over 200 miles in that time. It was one of the finest cruises we had had, although we both had to work rather hard, being short-handed.

Before closing, I would like to make a few remarks, which may be of service to other yachtsmen who contemplate cruising in Nova Scotia waters: The prevailing winds during the summer months are from the N.W. to S.E., the N.W. bringing clear, fine weather, and the S.E. rain and fog. The N.W. winds generally last for three days, blowing themselves out in the third day. If the wind springs up in the morning at sunrise the chances are that it will blow heavy all day, increasing to its maximum about 2 P. M. The S. and S.W. winds generally spring up about 9 or 10 o'clock in the morning and die away about 5 o'clock in the afternoon. A S. wind often shifts to the S.W. and freshens on a falling tide. These are our finest and most satisfactory winds, and are ideal for sailing. We rarely ever have any sudden squalls, and due warning is always given of a coming gale. The harbors along the coast are well buoyed and lighted. Shoals are marked by red and black spar buoys, and the entrance to the most important harbors are marked with automatic buoys. Provisions can be had at a reasonable price at almost any place. The people generally will be found most obliging and hospitable.

British Letter.

THE dead season is once more with us; racing yachts of any importance are all in their winter quarters, and with the exception of a few straggling fixtures of small clubs on the coast or up river, the sport is in abeyance until next spring. But though there is no more racing to be done for another six months, there is plenty of good work to be got through during the winter, and one of the most pressing questions is that with reference to the present rating rule, and another, and if possible more important one, concerns the formation of some rules for scantling to govern the construction of racing yachts—not handicap boats only, but also class racers, and, indeed, class racers in particular. It has been urged by the many supporters of the present Y. R. A. rating rule that it produces a wholly desirable type of boat as regards shape and internal capacity, but these are the opinions chiefly of the framers of the rule and not of the yacht owners themselves. It is a fact that nothing smaller than a 52-footer is fit to live in for the simple reason that in anything smaller an ordinary person cannot stand upright. The question of construction is even more important than that of actual shape, for it is evident that in the larger classes—the 65-footers and the big boats—there is ample headroom and accommodation even in boats built to suit the present rule; and yet these classes are absolutely extinct. Many reasons have been put forward to account for the grievous falling off in class racing, by the supporters of the present Y. R. A. rating rule—every one, in fact, but the right one. It has even been suggested that if the King or the Prince of Wales were to build a large racing cutter the sport would revive and all would yet be well. Every true-hearted Briton would welcome the advent of His Majesty or of the Heir Apparent, or both, to the ranks of yacht racing; but if the sport is to run on its own merits, on its own bottom in fact, it must not be dependent upon the will or pleasure of any one person, however exalted or how-

ever popular. The real truth is that owners will not build class racers because there are at present no restrictions on construction. The result is that building is far too costly because hulls have to be cut down in weight to the smallest possible fraction. This means enormous expense, a fragile hull and a yacht which will only sell for the scrap heap when her short racing career is over.

The Yacht Racing Association is fully aware of all this, but, instead of doing its obvious duty of fostering and encouraging yacht racing by improving or altering its rule of rating and drawing up some reasonable scantling regulations, it follows the custom attributed to the ostrich of burying its head in the sand and trying to imagine that all is as it should be. The inevitable result of this neglect of its duties is the almost total disappearance of class racing—its own particular pet ewe lamb—and the formation of innumerable one-design and restricted classes, which, although not providing such a desirable form of sport as class racing, at least gives owners a reasonable amount of racing and relaxation at a moderate outlay.

The problem of the revival of class racing has to be faced by the Y. R. A. sooner or later, as they are the only body which has the necessary power and influence to make it possible for owners to return to that highest form of yacht racing from which they ought never to have been driven, and every season that the ruling body continues to neglect its palpable duties will only add to the difficulties which it has created for itself by its own apathy and lethargy, inasmuch as every fresh season brings with it a large increase to the handicap, one-design and restricted classes, and a decrease in the already much-attenuated remnants of what were once the rating classes. The Y. R. A. wants new blood and a few more practical men to stiffen it; at present it appears to be too much inclined to live on the memory of past achievements. In the meanwhile class racing has fallen to the lowest point it has ever reached. It can fall still further, but it would be a pity and it is really quite unnecessary if bold measures of reform are undertaken in the proper quarter. Whether the requisite steps will be taken this winter is quite another matter.

Mr. M. B. Kennedy's new Fife yawl, White Heather, is to be in charge of Charles Bevis next summer. This is welcome news, for it was abundantly evident that full justice was not done to the smart vessel during the past season, and on more than one occasion she was downright badly sailed. No such mistake will occur so long as Bevis is in charge, and it will be interesting to see how White Heather will perform against Brynhild when the utmost possible is being got out of her. It is stated that Mrs. Turner Farley, who this season owned and sailed the handicap boat Nebula, contemplates joining the 52ft. class next year, and that Mr. W. P. Burton will leave the 52ft. class and race in the 65ft. class—that is, of course, provided he can get anything to race against.

E. H. KELLY.

New York Y. C.'s Proposed New Class.

COMMODORE BOURNE, of the New York Y. C., has appointed a committee to formulate a new one-design or restricted class of boats in the neighborhood of 30ft. waterline. This committee, which is composed of three of our best known amateurs, Messrs. Newbury D. Lawton, William Butler Duncan and Addison G. Hanan has sent out the following letter to the members of the club:

A proposition having been made by a number of members of the New York Y. C. for the building of restricted or one-design class, and a committee having been appointed to take up the matter and put it in shape for consideration by such members as may be interested; following out the views of those who have originated the idea, the committee have prepared the following suggestions, as to the details for the class:

Type.—The boat to be of a type intended to be promoted by the present rule of measurement of the New York Y. C., a wholesome seaworthy craft free from freak features.

Size.—A keel boat, about 30ft. waterline, short overhangs and of moderate beam and draft.

Plan.—Cabin house not less than 10ft. 6in. in length, about 4ft. wide, having straight sides with glass transom lights; toilet room with closet and basin, berth for man forward, cockpit not less than 6ft. long with rail set outside to form seat on deck.

Fittings.—Complete but simple outfit for cruising; transom cushions; stove, ice-box; tank.

Sails and Rigging.—Sail area about 1,000 sq. ft.; jib and main-sail rig; spinnaker and balloon jib allowed; solid spars.

Selection.—Boats when completed to be drawn by lot.

Regulations.—Yachts to be steered by a member or amateur. Two paid hands allowed. Crew all told limited to four persons.

Entire cruising outfit to be carried.

Special specifications to be agreed upon for sizes, weights and details of outfit.

Preliminary plans, specifications and estimates have been obtained.

The committee would be glad to learn if you are interested in building in this class and if you desire to have notice of the meetings of the committee.

The committee wish also to state that, should the members so desire, they are prepared to take up the question of a class or classes, either larger or smaller than the one that has been outlined, and they would be glad to receive any suggestions as to such class or classes.

RECORDS OF AMERICAN Y. C. RACEABOUTS.—The Regatta Committee of the American Y. C., of which Mr. H. de B. Parsons is chairman, has compiled the following table which gives the standing of the seven club raceabouts at the close of the season:

	Starts.	1sts.	2ds.	3ds.	Points.
Cricket, Macy Willets.....	12	2	5	2	47
Kid, Oliver Harriman.....	10	0	3	1	33
Hobo, Trenor L. Park.....	12	3	2	1	42
Rascal II., S. C. Hopkins.....	4	1	1	1	17
Howdy, G. L. Mercer.....	8	1	0	0	16
Busy Bee, S. Wainwright.....	12	3	1	1	39
Rana, H. Willets.....	10	2	1	4	38

The first prize was a silver cup, presented by Commodore Trenor L. Park. The second prize was a silver mug presented by Dennie Hare.

RECENT SALES.—Messrs. Macconnell & Cook have made the following sales: Steam yacht Hamilton to William Park, of Santo Domingo, which will be used about the West Indies; gasoline boat owned by E. Morgan Griffen, of Oyster Bay, to Henry S. Van Denmark, of New York; launch Erminie to E. R. Reynolds, of West Hampton, L. I.; sloop yacht Narika to F. C. Hinckley, of New York, and the cabin launch Florence to W. E. Reynolds, Jersey City.

18-ft. Restricted Class for Chicago Y. C.

WHEN the Chicago Y. C. established the 30ft. class last season, it found that this size boat bid fair to be very popular and fully answered the requirements of those men who were willing to invest \$5,000 or thereabouts. It was found that there was a large contingent in the club house whose demands were more modest and who wanted a less expensive boat for day sailing and racing. In order to meet the requirements of these men, a committee was selected to investigate and report. The committee was composed of Messrs. C. P. Pinkard, A. G. Cuthbert, A. D. Edwards and Edward Rosing.

In their report the 18ft. restricted class was recommended for adoption. This was done. The club has offered a handsome trophy for annual competition. The first races for the cup will be held on Sept. 2, 4, 5 and 6, 1905. We publish in full the conditions governing the trophy, as well as the construction rules, to which the boats racing in this class must conform:

The Trophy.

In offering this trophy the Chicago Y. C. hopes to encourage the building and handling of a strong, seaworthy and comfortable type of small yacht, the chief use of which will be for afternoon sailing, yet whose cabin space will be sufficient for cruising needs. For this purpose the above class has been chosen.

The conditions governing the holding of the trophy are as follows:

(1) The title to the trophy shall always remain vested in the Chicago Y. C.

(2) Any yacht which complies with the rules of the class, and whose owner is a member of any yacht club in good standing, may compete for the cup. Any yacht, once admitted to the class, shall not be debarred in future because she does not comply with changed construction or racing rules.

(3) There shall be four races, held off the harbor at Chicago, on dates designated by the Chicago Y. C., between Aug. 15 and Sept. 15 of each year.

The first and third races shall be twice around an equilateral triangle, the buoys for which shall be placed as follows: Not less than one knot, about east of the Van Buren Street gap, there shall be a fixed buoy with a white flag. Two knots northeast of this buoy shall be a fixed buoy. Two knots east by south one-third south of the first buoy shall be a fixed buoy. The starting and finishing lines shall be designated by fixed buoys, one with a red flag, one with a blue flag, placed at right angles to the first and last legs of the course. The direction around the triangle shall be announced by the judges before the preparatory signal is given, one leg to be to windward, if possible.

The second and fourth races shall be three knots to windward or leeward and return, twice around, the buoys for which shall be placed as follows: Not less than one knot about east of the Van Buren Street gap, there shall be two fixed buoys at a suitable distance apart, one of which shall have a white flag (designating it as the turning buoy for the second round). The line between the buoys shall be at right angles to the direction of the wind. Three knots to windward or leeward of the white flag buoy there shall be a fixed buoy.

(4) The standing of the yachts after each race shall be computed by percentages, as set forth in the table, only those yachts which finish the course being allotted a percentage. The percentage shall be based on the greatest number of yachts starting in any one of the series of races.

(5) In case of postponement, the same kind of race shall be sailed on the next subsequent racing day.

(6) When two or more yachts have an equal highest percentage at the end of the fourth race, the tie shall be decided by an additional race or races, sailed in the order of the series, only those yachts which are tied being allowed to start. If two or more yachts are tied for any other prize except first prize, the prize shall be equally divided.

(7) The yacht which makes the best record in the series of races shall have the right to hold the cup until the first day of August of the next following year, at which time it must be returned to the Chicago Y. C.

(8) The Chicago Y. C. shall have engraved on the cup the name of the winning yacht, the name of the club to which it belongs, and the date of the deciding race.

(9) To any yacht winning any race in the series, the Chicago Y. C. will present a yellow flag; to any yacht finishing second, a red flag.

(10) To the yacht winning the series the Chicago Y. C. will present a special yellow flag, and a suitable money prize. To the yachts finishing second and third, the Chicago Y. C. will present suitable money prizes.

(11) To each amateur member of the crew of the winning yacht, the Chicago Y. C. will present a medal.

Construction Rules.

Any evasion of the spirit as well as the letter of these rules, shall disqualify a yacht from racing in this class.

Yachts in this class shall be of the ordinary type, and any unusual shape such as double hull, catamaran, etc., or the use of bilge boards or other similar contrivances, shall not be permitted.

(1) Length.—The load waterline length shall not exceed 18ft. The over all length, measured from the extreme ends of the hull, shall not exceed 31ft. The length of the forward or after overhang shall not exceed 65 per cent. of the total overhang length allowed.

(2) Beam.—The greatest beam of the cross section, midway of the forward overhang shall not exceed 45 per cent. of the greatest beam of the yacht. The deck line and the center line shall make an angle not greater than 30 degrees.

In computing the allowances for beam in the table, the load waterline beam shall be the basis.

(3) Freeboard.—The freeboard shall be as given in the table. In addition to the freeboard there shall be a continuous rail on each covering board, extending from stem to stern, whose least height shall be 1 1/4 in. and least thickness 3/8 of an inch.

(4) Ballast.—The weight of prescribed ballast, based on load waterline beam, shall be not less than number of pounds specified in table. Ballast must be fixed in position.

No movable centerboard shall be counted as ballast.

(5) Draft.—The top of the ballast prescribed must be at least 2ft. 6in. below the waterline. Extra ballast may be placed higher than this depth, but must be fixed in position.

(6) Cockpit.—The cockpit shall be watertight and self-bailing, with all parts of the floor above the load waterline.

(7) Cabin Floor.—The minimum width of the cabin floor for a length of 5ft. shall be not less than 25 per cent. of the load waterline beam.

(8) Cabin Trunk.—The sides of the cabin trunk shall be flat and vertical. The sides of the cabin trunk shall be at least 8in. high at the forward end and at least 10in. high at the after end, except that, in cases where the freeboard exceeds the requirements, the excess may be deducted from the cabin trunk sides. The cabin trunk must be at least 6 1/2 ft. long. The height of the cabin trunk, measured from the level of the top side of the covering board to the highest point of the top side of the cabin trunk, exclusive of the hatch, shall not exceed 1/2 in. for each 3in. of greatest beam.

The width of the cabin trunk shall be at least 60 per cent. of the greatest beam.

A cross section of the top of the cabin trunk, for at least 5ft. of its length, shall be the arc of a circle.

If the required headroom is obtainable under the above rules, additional height of cabin trunk is allowed.

(9) Headroom.—The minimum headroom, under the cabin trunk beams, over the entire floor space required, shall be 3ft. 10in.

(10) Scantlings.—(Dimensions and areas expressed in inches.)

1. Stem, oak—	
At head, sided	2 3/4
molded	4
At load waterline, sided	2 3/4
molded	5
At keel, sided	2 3/4
molded	6
2. Stern post, oak—	
Sided at tuck (crossing of rabbet)	3 1/4
Siding may diminish from tuck to keel.	
3. Horn-timber, oak—	

At crossing of stern post, sided	3 1/4
molded	4
At after end, sided	3 1/4
molded	2 1/2
4. Keel, oak—	
Minimum depth	3 3/4
Minimum sectional area	38
Minimum depth allowed for a length of one-third load waterline length, beyond which it may be tapered to one-third less at stem and stern. The minimum sectional area (breadth multiplied by depth in the middle of the keel) may be made up, if desired, by a deeper keel. The breadth of keel may taper from point of greatest section to siding of stem and stern post.	
5. Frames, oak—	
Minimum sectional area	2
Maximum spacing (between centers)	9
The required sectional area may be made up of smaller frames spaced closer together; or of combinations of larger and smaller frames appropriately spaced (in no case greater than 9in. between centers). This minimum sectional area shall apply to a space of at least five-sixths of the load waterline length in the center of the yacht; forward and aft of this space the sectional area may be reduced by 20 per cent.	
Any frame which is reduced in strength by being cut for a chain plate or chain plate fastening must be proportionately increased.	
6. Floors, oak—	
Minimum sectional area	5
Maximum spacing (between centers)	9
The sectional area above refers to the center of the floor timber. From the center to each end the distance shall be not less than 20 per cent. of the greatest beam at the frame to which the floor timber is attached. The sectional area may diminish gradually from the center outwards, but shall be at least as great at the end as the frame to which it is attached. The minimum sectional area of 5in. in the center shall be maintained for the full load waterline length, fore and aft of which, it may be reduced by 40 per cent.	
Metal floors of weight at least equal to the weight of prescribed oak floors may be substituted for the oak floors.	
7. Shelf (clump)—	
Minimum sectional area, middle	4 1/2
ends	3
The minimum sectional area of 4 1/2 in. shall be maintained throughout the central two quarters of the shelf or clump, from which points it may taper to 3in. at the ends. The ends of the deck beams may be jogged into the top of the shelf or clump a distance not exceeding one-third of their own depth. If the deck beams are jogged in to a greater depth, the sectional area of the shelf or clump shall be increased in proportion.	
8. Bilge stringer—	
Minimum sectional area, middle	3
ends	2
The minimum sectional area of 3in. shall be maintained throughout the central two quarters, from which points it may taper to 2in. at the ends. At least one bilge stringer must be run on each side. In yachts whose greatest beam exceeds twice the greatest distance from the under side of deck planks to upper side of keel, two such stringers on each side must be run.	
9. Mast keelson, oak; minimum length, 7ft.—	
Minimum sectional area under mast	14
may taper at ends to	8
Or there may be substituted a truss running athwartships, supporting the mast of weight at least equal to that of the mast keelson.	
10. Deck beams—	
Minimum sectional area, main	3 1/2
auxiliary	2 1/4
half beams	1 1/4
Maximum spacing (between centers)	9
The minimum sectional area shall cover at least the middle third of the beams, with a taper in the molding to 20 per cent. less at the ends.	
There must be one continuous main beam at the bitts, at fore end of cabin trunk, at after end of cabin trunk, at transom, and two at the mast (partner beams).	
11. Cabin trunk beams—	
Oak, sided	1
molded	1 1/4
Maximum spacing (between centers)	9
12. Planking—	
Finished	13-16
Sheer strake must be oak. All butts must be made on oak butt blocks of at least 7/16 in. thick and full length between ribs.	
13. Deck and cabin trunk top—	
Finished	3/4
(A reduction of 1/4 in. allowed if canvas covered.)	
14. Deadwood shall be of oak.	
(11) Spars.—All spars shall be solid.	
(12) Rigging.—There shall be at least two shrouds on each side, of steel wire at least 1/4 in. in diameter. The forestay and mast head backstays shall be of steel wire at least 1/4 in. in diameter. The bobstay, if of wire, shall be 3/16 in. in diameter; if a rod, it shall be 1/2 in. in diameter. The stems of all turnbuckles, if of steel, shall be of 3/16 in. greater diameter than the stays they tighten; if of bronze, 1/4 in. greater diameter.	
(13) Sails.—Yachts in this class may carry mainsail and jib (the combined actual area of which shall not be greater than the allowance in the table), balloon jibs and spinnaker. The area of the mainsail shall not be greater than four-fifths of the total sail area allowed.	
The distance from the center of the mast to the outer end of the spinnaker boom, when the latter is at a right angle to the fore and aft center line of the yacht, multiplied by the height of the spinnaker halliard block above the deck, shall not exceed 400 per cent. of the allowed area of the jib.*	
The distance from the forward end of the bowsprit to the center of the mast, multiplied by the height of the highest jib halliard block above the deck, shall not exceed 300 per cent. of the allowed area of the jib.*	
Spinnakers and balloons must be triangular. No spinnaker shall extend above the spinnaker halliard block or beyond the end of the spinnaker boom. No jib shall extend above the highest jib halliard block or beyond the end of the bowsprit.	
(14) Fixtures.—The cabin shall contain two transoms, one on each side, at least 6ft. 6in. long and 18in. wide in the narrowest part.	
(15) Certificate.—A builder's certificate, covering all details of construction, must accompany a new boat.	

Table of Minimum Ballast, Maximum Sail Area and Minimum Freeboard.

40-ft. Waterline Cruiser.

THE qualities of a cruiser should be seaworthiness, comfort and speed, the first including certainty of handling under all conditions, and ability to work to windward under reduced sail, as well as safety and dryness in a seaway. Comfort depends largely upon these, as well as on the amount of room in the vessel and the disposition of the available space. Speed, while not as necessary as the other qualities, may be combined with them. Although a 40-footer is large enough to take care of herself in most weather, she may occasionally be caught on a lee shore or blown off the coast, and at such times a good sea boat is very comforting to those who handle her.

In the design of the vessel illustrated in this number the above qualities were aimed at in the order named. She should be able to live in any weather, handle well, go to windward under short canvas and in a heavy sea, carry her sail as well and as long as any boat of her size and be fairly fast under all conditions. The arrangement of the cabin in any yacht is largely a matter of individual preference. While one owner prefers the small steerage aft, another fancies stepping directly from cockpit to cabin.

The accompanying plans, made by Mr. C. H. Hall, show a vessel of easy form and large lateral plane. The sections have slack bilge and full garboards, and the fore and aft lines have been kept very fair and easy. The centerboard is of moderate area and placed well forward. The slight drag of the keel should favor easy steering. The form in general conduces to weatherliness and good behavior in a seaway.

The sail plans are well balanced; the amount of sail is moderate, but sufficient for a cruiser. The head sails are the same for both rigs. The sloop's main boom is short to facilitate reefing, and gives good headroom over the cockpit.

The construction is simple and inexpensive, but of ample strength.

There is a watertight cockpit aft, from which one steps directly into the saloon. On the starboard side is a large locker for valises, etc., with a compartment for oilers. The top of this makes a handy place for binoculars. On the port side is a toilet room with wash basin and water closet and linen locker. The saloon contains a sofa each side and a sideboard and buffet, and is fitted with shelves and lockers. Forward of the saloon on the starboard side is the owner's stateroom with berth bureau, wash basin and wardrobe. On the port side is the guest's stateroom and passage to galley. If desired the passage could be thrown into the stateroom by omitting the bulkhead between them. Forward of the staterooms is the galley, with stove, dressers, sink, ice-box, plate racks, shelves and lockers. The ice-box and stove are as far apart as conditions permit. Still further forward is the forecabin with folding berths for three men, water closet, lockers and transom.

Skylights ventilate saloon and staterooms, a small hatch gives ventilation to galley, and a hatch gives access to the forecabin.

A small pump brake windlass is placed on deck forward. Heavy ground tackle and the usual equipment are provided. The water tanks are placed under cabin floor each side of centerboard trunk.

The dimensions are as follows:

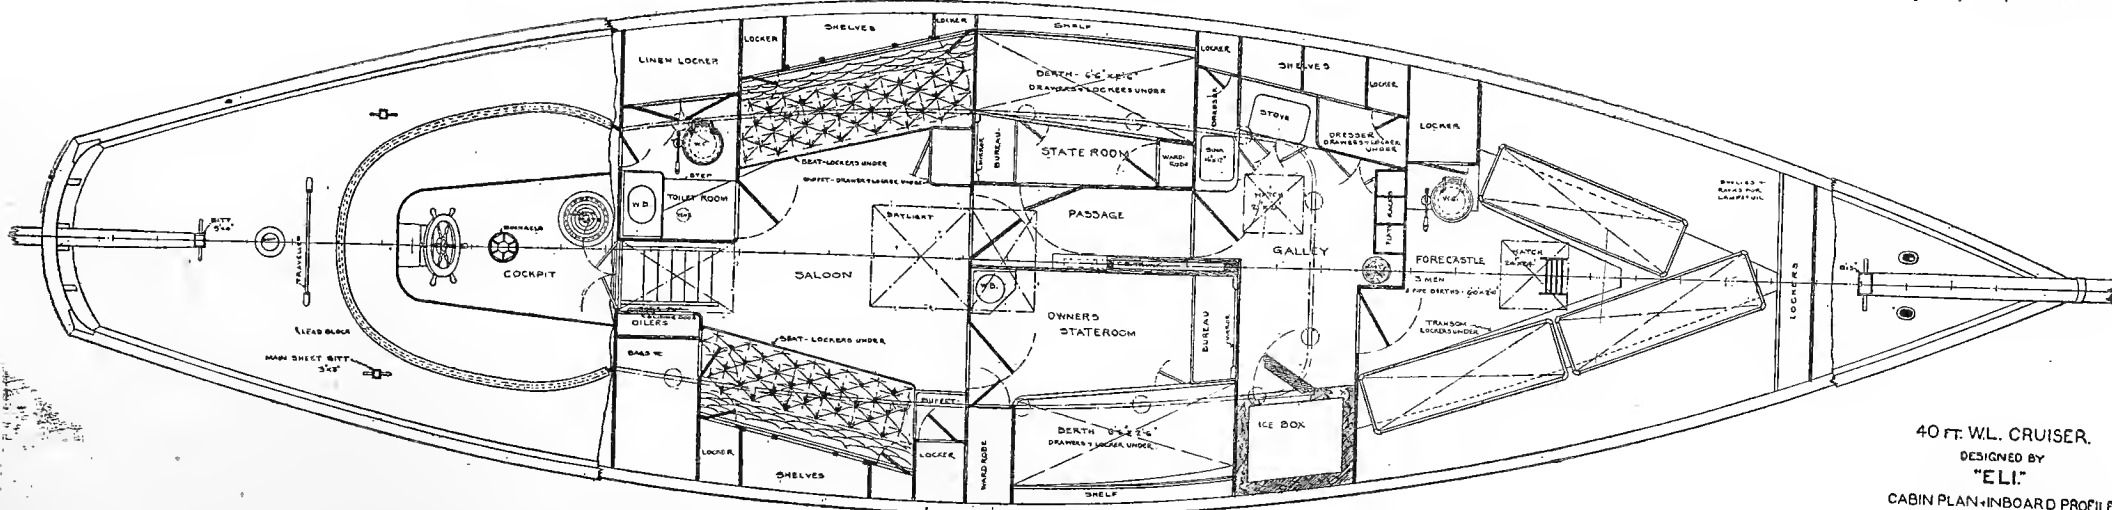

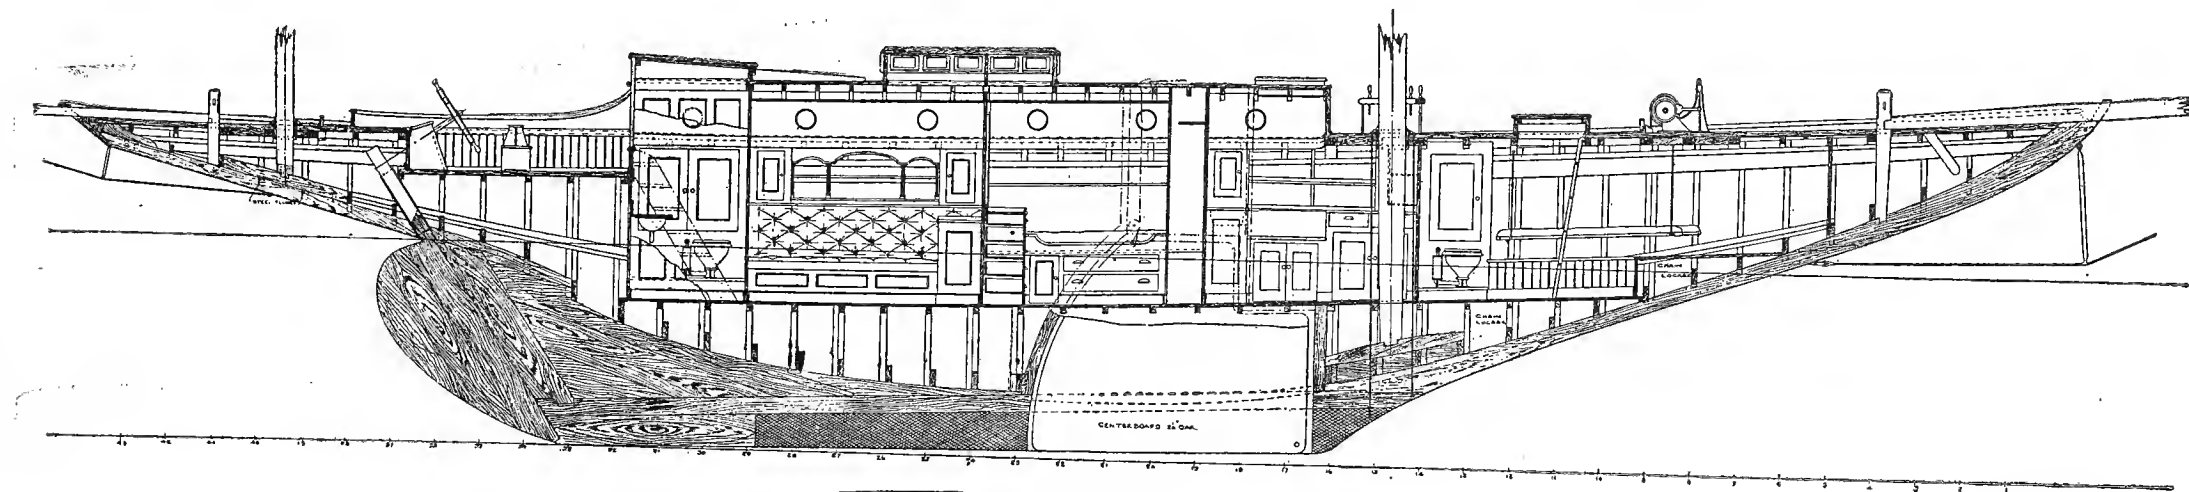

Length—	
Over all	60ft. 10in.
L.W.L.	40ft.
Beam—	
Extreme	15ft. 3in.
L.W.L.	14ft.
Extreme Draft	6ft.
Freeboard to top of planksheer—	
Forward	4ft. 9in.
Aft	3ft. 3 1/2 in.
Least	3ft.
Overhang—	
Forward	9ft. 10in.
Aft	11ft.
Displacement, long tons	22.7
Ballast, total pounds	17,500
C. B., from fore end of L.W.L., 21.48ft., 53.7% of W.L.	
C. L. R.—	
Flat surface below rabbet and 1-3 of fair body	25.2ft.
With centerboard	24.3ft.
Vertical longitudinal section from fore end	
W.L.	22.8ft.
Area longitudinal section	175.2 sq. ft.
Longitudinal section with C.B. from fore end	
W. L.	22.5ft.
C. E.—	
Yawl, from fore end W.L.	22 3/4 ft.
Above L.W.L.	23ft.
Sloop, from No. 3	21.9ft.
Above L.W.L.	24.5ft.
Area—	
Four lower sails, yawl	1,835 sq. ft.
Three lower sails, sloop	1,890 sq. ft.

PINKIE BURNED.—Mr. Allan Pinkerton's racing sloop Pinkie was totally destroyed by fire on the night of October 16. The boat was anchored off the owner's place at Islip, L. I., and as there was nothing inflammable on board, the fire was no doubt the work of an incendiary. Pinkie was designed and built by the Herreshoff Manufacturing Company, and was 41ft. 6in. over all, 25ft. 6in. waterline, 11ft. 6in. breadth, and 2ft. 6in. draft.

WOMAN QUALIFIES AS MASTER MARINER.—Miss Jane Morgan, of Philadelphia, daughter of Mr. Randal Morgan, owner of the steam yacht Waturus, has successfully passed an examination before the United States steamship inspectors, and now ranks as a "master mariner." If she is inclined, she can command her father's 210ft. yacht or an ocean liner. Her certificate covers "all oceans." Miss Morgan is one of five women in the world to be so honored.

Gas Engines and Launches.

(Continued from page 350.)

BY F. K. GRAIN.

Gasolene—Continued.

A VERY good plan is to solder the connections, although if the connections between the batteries are made with flat copper ribbon having holes for the binding-posts there will be very little trouble from this. Another point sometimes neglected is the switch. When used around salt water it naturally corrodes, and a piece of emery cloth should at all times be convenient for brightening the contact surfaces. Supposing now that the connections are all in perfect order, and the spark remains insufficient and apparently weak. In this case do not abandon the entire set of batteries, as oftentimes there will be but one battery in the set which has lost its strength. In this case remove the poor cell and the remaining ones will generally be sufficient for the time being at least. In order to test the quality of the batteries, some kind of an instrument is necessary, and for this purpose the ordinary 25-cent bell is very good, as by ringing each bell separately it is very easy to determine if any of them are weak. Having disposed of the electrical end of the difficulty, and supposing it is all right, the next point is to determine whether the vaporizer is in good working order, and whether it is getting its gasolene. Being assured that there is a good supply of gasolene, the igniter points being cleaned, and the spark good, there is only one remaining difficulty to look for. This, in a two-cycle engine will be the flooding of the crank case with gasolene. The effect of this is to create such a rich mixture that it will not ignite; the remedy in this case is to open all the cylinder cocks, also the cock in the base of the engine; first, however, shutting off the gasolene; then turn the fly-wheel around rapidly several times; this will generally clear the engine of its overload. Should the engine then fail to start, it may be want of compression. This is sometimes caused by the cylinder being dry for want of oil. In order to obtain quick results, cylinder oil can be poured directly in any opening above the piston, and the engine turned over several times will allow the oil to work down before attempting to start it. It sometimes happens that where this remedy is used and the engine starts, it will only make a few revolutions and then stop. The cause of this is quite often the oil being distributed over the igniting point. In this case, although the electrode will show a spark on the outside when the points are brought together, the flash of the spark inside will be enveloped in the oil, and consequently will not ignite.

We have now exhausted every means that would be used by the expert, and if failure is still met with, it would be well to draw off through the vaporizer a considerable quantity of gasolene, as it might be the case that the gasolene contained considerable water, which of course would settle in or near the vaporizer, this being usually the lowest point. This failing, it will be necessary to test the gasolene. A very simple way of doing this is to put a few drops on the cylinder head and see if it can be ignited by wiping the electric wire through it. Of course in cold weather the low grades of gasolene generally used will oftentimes not vaporize well in starting, and it is a good plan to have a small oil can filled with gasolene and inject about a teaspoonful into the cylinder. This will assist in getting the initial explosions. People tell us that after trying all these remedies they have worn all the skin off their hands, etc., and still the engine will not go. Right here let us say to you to never do this, as it is a waste of time; for even should the engine after a lot of violent turning take a notion to go, the operator is still in the dark as to the cause of the trouble. If, after a reasonable number of revolutions, it refuses to go, let the fly-wheel alone. Sit down and go over the engine thoroughly, and endeavor to locate the trouble, which you have conclusively proved exists.

Now, coming to the mechanical part of the firing mechanism, one of the principal causes of the trouble is in the make-and-break sparker—the sticking of the igniter lever where it passes through into the cylinder. Quite often this is not noticeable to the novice as this rocker arm usually has but a very small movement. It will sometimes set so that it cannot be operated even by hand. This is caused either by corrosion or by an accumulation of burnt oil. Where the oil is of poor quality, this is very liable to occur. The injection of a small quantity of kerosene from the outside on these parts, not only before, but after, using the engine, will as a rule entirely prevent this trouble. In most all cases the small lever which is fastened to the igniter arm on the outside is generally secured by a taper pin; these taper pins will at times work loose or be improperly fitted. In this case the lever will move, but the igniter arm will remain stationary. In attempting to drive the pin in again, should it be loose, always hold a weight under and against the lever; otherwise the arm is liable to be sprung, and the pin will not drive in firmly.

Another very common trouble is that either owing to wear, want of adjustment, or corrosion, the tripping device does not operate, or may operate entirely different when worked rapidly than when merely operated slowly by hand. Of course the springs, which are a necessary evil in all make-and-break sparkers, have been, and always will be, a source of trouble, as they are liable to become weak, and if too highly tempered will break, and it is often the case that where the spring rubs against a moving part, the friction will wear it, and of course it then either breaks or becomes weak. One difficulty which is very easily overlooked, is that owing to the sticking or weakness of the spring, the electrode and flipper or rocker arm do not come firmly into contact before the separation, consequently the circuit is not perfect. The addition of an auxiliary spring held in position by hand will generally prove this, and we strongly advise in all cases that extra springs should be carried, and these springs should be carefully protected by grease or vaseline until wanted. Piano wire undoubtedly makes the best springs, but of course is liable to, and will, deteriorate very fast when rusty; and, being a very highly polished wire of fine quality, it is very prone to rust. Phosphor bronze is also employed for springs, and although rust-proof, lacks the resilience and quick action of the piano wire. It has been the aim of the manufacturers to design their sparking

mechanism so that the duration of the contact or closing of the circuit would be as short as possible, in order to avoid wear on the batteries; but as most leading engines are now designed, it is possible to adjust so that the duration of contact is too short. The effect of this is to give the coil insufficient time to charge, and in reality puts an extra strain on the batteries. We have known a number of cases in small engines where the contact has been too short; they have in consequence refused to operate at high speeds. The longer the duration of the contact, the larger will be the spark; in fact, by adjustment of the contact the size of the spark can easily be doubled, and modern practice now tells us that in place of a coil which will allow of eight to ten volts, it is preferable to use a coil which will reduce the voltage to about one-half that figure, and increase the duration of contact. The effect of this is that although the spark is reduced in size, it is more uniform, the wear on the batteries is reduced, and the burning of the contact point from the high voltage is avoided.

Of course in the four-cycle engine we are not as liable to have battery trouble or trouble with the firing mechanism as we are with the two-cycle, as we have in that type of engine but half the number of working strokes, and also less heat to affect the parts to contend with.

In a great many cases the firing devices, batteries, etc., are pronounced failures, where in reality the trouble may be in too high compression. High compression has lately become the fad, and its effect on the igniting of the engine has been given very little consideration. As we increase the compression, we of course increase the atmospheric pressure in the cylinder, offering thereby an increased resistance to the formation of the electric arc; and in cases of this kind the remedy is to increase the battery power sometimes as much as double.

Without doubt the next serious trouble is want or loss of compression in the cylinder. The effect of loss of

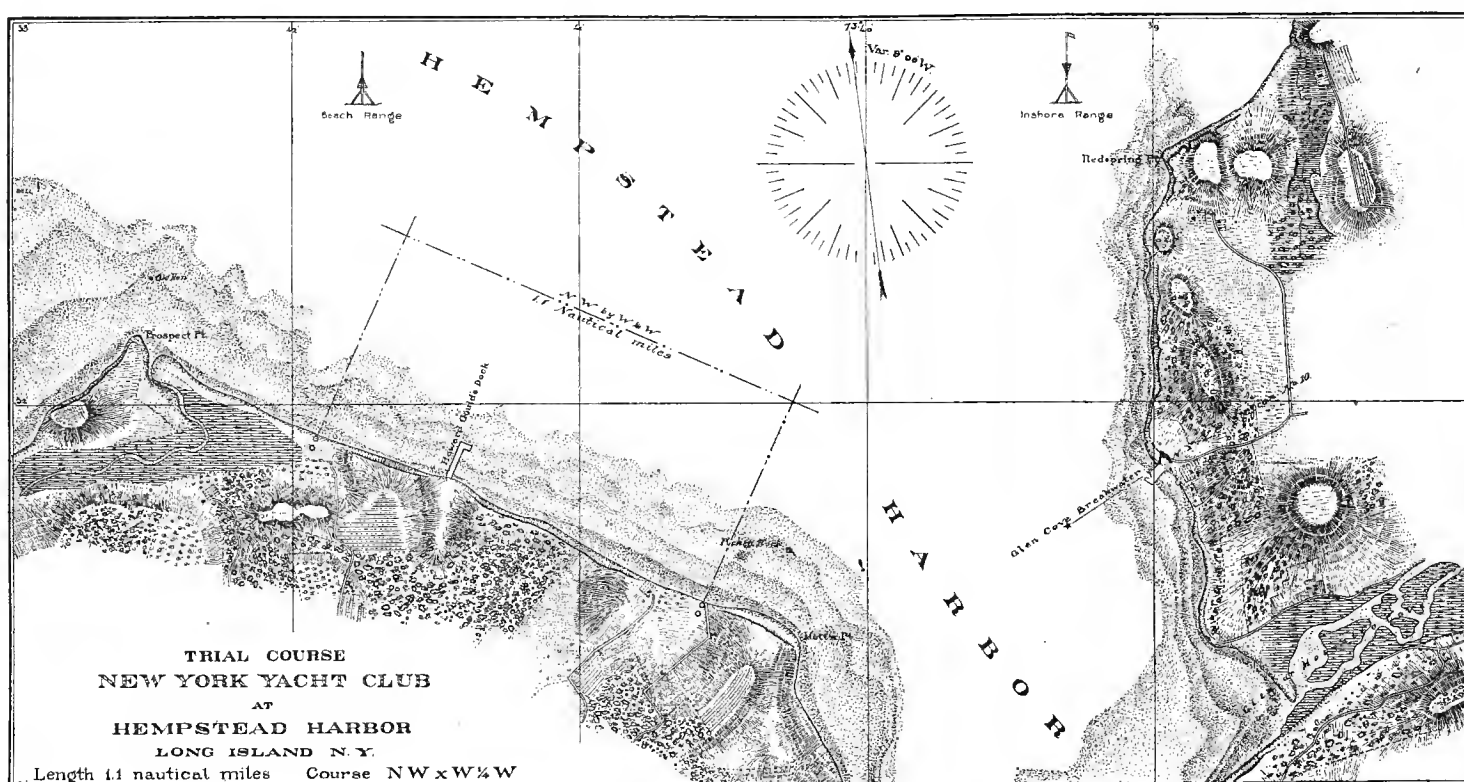

charge of air. To remedy this, remove the spring and stretch it out. In order to determine how much the spring has been stretched, it is a good plan to measure it first. Again, on the other hand, if the spring is made too stiff it will act as a throttle and make the engine difficult to start, as it will not come up to its power as quickly. It is customary to use a funnel with a strainer when filling the gasolene tank; but we do not think this amounts to much, as the ordinary strainer is not sufficiently fine; we therefore prefer a piece of cheesecloth or silk placed over the funnel. In many of the generator valves there is a tendency for the gasolene to blow in the form of a spray, owing to the valve not closing sufficiently quick. This, of course, is a sheer waste of gasolene, the loss in many cases being sufficient to run the engine. To avoid this, place a short piece of pipe or an elbow under the mouth of the vaporizer; this will enable the engine to pick up this spray. In this case, after the engine is started, the supply of gasolene may be cut down; but in starting, the supply must be set same as if no elbow was used. We are now assuming that the valve is mechanically perfect, it being sometimes the case that a defective valve is met with which is not proportioned to the engine, and has a defective seat. The effect of using a valve out of proportion to the engine would, however, mean only a loss of power, with a possibility of difficulty in starting the engine.

Measured Trial Course New York Y. C.

A MEASURED course has been laid out on the west side of Hempstead Harbor, Long Island Sound, with the ends marked by ranges.

These ranges have been located by the U. S. Coast Survey by courtesy of the Department of Commerce and Labor.

The westerly ranges are located about a mile S.E. of the bell buoy off Old Hen Rock, Prospect Point, and

compression in the two-cycle engine is much more serious than in the four, as the loss of compression in the two-cycle in the cylinder means almost a total loss of the compression in the base. This may be due to defective workmanship, or it may result from a poor quality of cylinder oil being used which will set the rings so that they will not expand. Or it may be the **total lack of oil**. In many cases it is also caused by the breaking of the piston ring, which sometimes is a serious matter, as it is liable to break up into small pieces and become caught in the cylinder, which generally results in a broken piston. Where it is thought that the compression has been lost by the clogging of the rings, they can generally be loosened by pouring a good supply of kerosene into the cylinder, and giving it time to get down around the piston and loosen the old oily residue. Continually running the mixture of the gas too rich will leave a deposit of soot which in time will also very effectually prevent the expanding of the rings. In order to test whether the mixture of gas is perfect, a piece of white paper held in front and near the exhaust pipe should not be discolored, or a black smoke coming from the exhaust is a sure sign of an over-supply of gasolene in proportion to the air. It is usual, in the two-cycle engine, to operate at a compression of about 50 pounds; more often under that figure than over; whereas in the four-cycle the compression should be not less than 60 pounds. In the four-cycle engine, the valves being mechanically operated, it will retain and is not as liable to loss of compression as the two-cycle, wherein the ports are opened and closed by the passage of the piston, and are therefore entirely dependent upon the fit of this part.

Vaporizers most usually employed, as we previously stated, are what are known as generator valves, being simply a self-acting poppet valve similar to the ordinary check valves. While this valve is excessively simple and operated entirely by the suction of the engine, it is capable of giving a great deal of trouble. At the point where the gasolene is fed under the seat of the valve the opening is generally less than one thirty-second of an inch, and it very often happens that a small particle of foreign substance contained in the gasolene will settle at this point. In this case, when the valve is pressed up by hand, the gasolene will apparently flow all right; but when the engine is started it will make but a few revolutions and stop, evidently for want of gasolene. In this case it will be found that this small particle by the quick suction of the engine will be drawn into the gasolene opening, shutting off completely the flow of gasolene, falling back again when the engine stops. In other words, acting as a check valve. This is a very common occurrence, and a small wire for cleaning the gasolene inlet should always be on hand. It often happens that the spring in the vaporizer becomes weak, and in this case it will admit of an over-

about 1/4 mile west of the western end of Sea Wall on Mr. Howard Gould's place.

The easterly ranges are located about 3/8 of a mile west of the red buoy off Mott's Point.

The front range in each case is on the low sand hills just back of the beach and is a pole about 30ft. long, painted white, and braced by timber braces with a white triangle just above the braces.

The inshore ranges are the same as the shore range, only about 40ft. high and the triangle is inverted, and they have a white flag at the top.

The length of the course is 1.1 nautical miles, and the magnetic compass is N.W. by W. 1/4 W.

Speed per hour.		Time over course.		Speed per hour.		Time over course.

YACHTING NEWS NOTES.

For advertising relating to this department see pages ii and iii.

SCHOONER LASCA SOLD.—The famous schooner Lasca, owned by Mr. Robert H. McCurdy, has been sold by Messrs. Tams, Lemoine & Crane to Mr. Robert P. Doremus, owner of the schooner Loyal. The steam yacht Reverie has been sold by Mr. Joseph B. Thomas through the same agency to Mr. Edward B. Corey.

MOTOR BOAT CHALLENGER TESTED.—The motor boat Challenger, designed by Messrs. Tams, Lemoine & Crane, was tested over the New York Y. C.'s measured course in Hempstead Harbor on October 22 with results that were most gratifying to all concerned. Challenger covered the course against the wind in 2m. 52s., and with the wind in 2m. 51s. The conditions were anything but favorable for high speed, as there was a fresh E. wind blowing and considerable sea. When running with a following sea, it was necessary to slow the engine down four times. It is certain that Challenger can beat these figures by several seconds. The Smith & Mabley engine ran without a hitch, and the boat's performance was a most creditable one. Figuring on the time of 2m. 51s. for 1.1 miles would give for 1 nautical mile a time of 2m. 35s., or a rate of 23.2 knots, which is equal to 26.7 statute miles per hour.

Canoeing.

Mahn-a-Wauk C. C.

FOURTEEN years ago the Mahn-a-Wauk C. C. was organized, and three years later had an active membership of thirty, while to-day the members are widely scattered, only three residing in Milwaukee. This situation represents the canoe sailing interests in the Middle West; but, fortunately, not the canoe sentiment, as the paddlers have increased in the same proportion that the sailors have diminished, and to-day in Milwaukee there is a colony of canoe men and women who spend their leisure hours on the upper Milwaukee River, where a stretch of three miles gives ample sweep for paddling.

The Mahn-a-Wauks were a lusty organization, begun by enthusiastic canoeists who limited the membership in order to keep out those who were not believers in canoeing and did not own canoes, but wanted to join the club because they thought canoeing was a delightful fad which was worth cultivating for the social enjoyment which it brought.

Edward H. Holmes, who now resides in Chicago, was Milwaukee's pioneer canoeist, and after interesting Frederick W. Dickens and Frank B. Huntington in the sport during the spring of 1890, the trio went on a canoe cruise on the Wisconsin River the following summer. Their experiences and exploits on that memorable trip interested other Milwaukee men, and on March 7, 1891, the Mahn-a-Wauk C. C. was organized with a membership of fourteen, and E. H. Holmes was elected president. The boat house on the lake shore at the foot of Mason Street near the Northwestern Depot was secured from the Lakeside Boat Club, and as the canoes made their appearance on Lake Michigan, the interest in canoe sailing grew.

The first racing meet and camp of the Mahn-a-Wauks was held on Oconomowoc Lake from July 4 to 18, 1891, and this diversion was so pleasing to the participants, that the members joined the Western Canoe Association during the winter of 1892, sending a delegation of six members to the midwinter meet of the Association in Cleveland. To the efforts of the Milwaukee canoe men was due the selection of the Lake Winnebago camp site near Oshkosh for the 1892 meet, at which the Mahn-a-Wauks were represented by fourteen members and ten canoes. In 1893 four members of the club went to the meet at Ballast Island, but in 1894 the entire membership went to Madison, where the meet was held that summer. Two went to Ballast Island in 1895, but only one representative of the club attended the Mullet Lake meet in 1896, while, with the exception of Commodore Cook, of Chicago, all of the tenants of tents at the 1897 meet at Delavan Lake were Mahn-a-Wauks. Then there was an interval of four years during which none of the Mahn-a-Wauks went to the Western Canoe Association meets, although two of the members went to the A. C. A. meets on the St. Lawrence River.

To the untiring efforts of F. B. Huntington and Frederick W. Dickens the old Western Canoe Association was merged into the Western Division of the A. C. A. during the regime of Commodore F. S. Thorn, who came to Milwaukee at the beginning of his term of office with Henry C. Morse, of Peoria, and effected the transposition. Then in 1892 Mr. Huntington, who had been elected vice-commodore of the division, and Dickens, who was elected secretary and treasurer, again went to work with all of their energy, and as a result the division held its first meet at Ballast Island, the home of the Western Canoe Association.

Under the leadership of E. H. Holmes the club made giant strides in 1891, and F. B. Huntington, who was his successor in 1892 as commodore, scored a success in handling the organization, which showed marked growth. George P. Mathes became the commodore in 1893, and during his regime the Mahn-a-Wauks showed their strength, the membership growing rapidly and the club house being completely overhauled. F. W. Dickens became commodore in 1894, and Richard Merrill succeeded him, and so great has been his popularity that he has never been superseded.

Three years ago the members joined the Milwaukee Y. C., which owned a fine house further up the bay and in a more satisfactory location, and there the canoes are now stored away on racks. The old club house was admirably arranged for the purpose to which it was devoted by the Mahn-a-Wauks. The ground floor was on a level with the waters' edge, and a long dock extended 15 ft. toward the breakwater, giving the members ample opportunity to rig up their craft before launching. On the floor above were the racks on which the canoes, duffle and sails were stored, access being gained by a lift controlled by an endless chain which carried the canoes safely to their second floor from the dock. Immediately in the rear of the canoe room was a large shop supplied with work benches and tools. On the third floor were the general assembly room, a galley and dressing room, around which were arranged the lockers. The walls and ceiling of the room was decorated with pennants, bunting, pictures, paddles and trophies of various description, all appropriately and artistically hung by F. W. Dickens.

The racing machines are no longer in favor; Milwaukee canoeists have taken up the paddling canoes, making the upper Milwaukee River their base of operations instead of Lake Michigan, and their number is steadily growing every year. For the men who still prefer sailing to paddling, the old Western Canoe Association Class C canoe makes a comfortable cruising craft. They are 16 ft. long and 40 in. beam, have an 8 ft. cockpit and carry 125 ft. of canvas distributed in a mainsail and a dandy. They are a staunch, seaworthy craft, capable of being navigated in a big sea with a fair degree of comfort, and besides, carry "two."

Nov. 8.—Greenville, N. J.—Annual 100-shot championship at Armbruster's Park.

Col. Bruce on the Palma Matter.

WHEN, several months ago, the Palma trophy, representing the international rifle championship, was returned with resolutions of apology and regret from the National Rifle Association of this country to the N. R. A. of Great Britain, nothing was heard in the matter from the captain of the winning American team. Col. Leslie C. Bruce held that position at no small personal outlay of time, effort and money, and when he brought back the trophy, he was congratulated on what everybody considered a worthily won victory against heavy odds over a field made up of no less than seven representative national teams. Having spent a summer of hard work in carrying out what to him was a most agreeable task, Col. Bruce arranged for a long foreign ramble, and when the N. R. A. people here were hurrying the trophy back, the Colonel was off in the mountains of Morocco after a sojourn in the picturesque south of Spain. It was not until he reached London on his way back a few weeks ago that he met a New York militia friend, who mentioned the fact about the trophy. It was the first the Colonel had heard of it, and he at first refused to believe it. On arrival in New York, there was a hurried catching up with a lot of past history, and now the Colonel is outspoken in his bluff Kentucky way over what he characterizes as one of the silliest bits of business which he has ever met with in his whole experience with American rifledom. Speaking to a member of the FOREST AND STREAM staff, Col. Bruce was asked to go over the story of the team and its work, particularly with reference to the alleged irregularity which came from the Council of the British R. A.

The correspondence which preceded the return trip of the trophy has already appeared in these columns, and our readers are aware that the question at issue was as to the character of the barrels of the rifles used by the Americans. Col. Bruce said:

"I cannot but feel that a grave blunder has been made, and I am not willing by my silence to have it appear that the American team at Bisley in 1903 won the trophy by taking the slightest unfair advantage of the other contestants. This is the only inference from the fact that the trophy has been returned and the victory of our team declared improper and irregular. More than that, the declaration made by the president of the National Rifle Association here, that, as captain of the team, I neglected to carry out orders, and thereby made possible the position taken by Col. Crosse, the secretary of the British Rifle Association, is utterly at variance with the facts.

"Let us make a very brief review of the organization and work of the team. I went forward, when the call was issued for a team, prepared to win a place on the squad, if possible. Gen. Spencer, president of the National Rifle Association, asked me rather to assume the post of captain and co-operate with the committee in the selection of the men in the preliminary tests, and later institute the team system which had so often won victory for the American marksmen. As a member of the original American team which visited Ireland in 1875, and of several subsequent teams, and, further, by constant participation in the sport since, I had been well schooled in this method of conducting matches. The conditions required us to use a service rifle, and we secured a lot of Krag-Jorgensen arms from the United States Ordnance Department. They were found to lack the uniformity of caliber necessary in the severe test we had before us, and we replaced the barrels with others of private make. These were prepared by Harry Pope, of the Stevens Arms Co. They take the Government ammunition and are in all essential respects true service rifles. At this time the United States Government was making extensive tests toward the selection of a new arm for the Regulars, and the barrels we chose were among those under trial. In Great Britain, we participated by invitation, using these weapons without objection in matches shot by organizations affiliated with the National Rifle Association there and under its rules. These shoots were prior to the date of the big match. Before the formal Palma match, our rifles were subjected to every form of inspection the official cared to make; our trigger pulls were tested, and I remember handing Mr. A. P. Humphrey, a member of the Council, at his request, a dozen or so of the cartridges we were using. On the afternoon preceding the day of the match, there was a meeting of the captains of the seven teams competing. Every point on which an objection might be raised, which any one wished to discuss, was brought up. I recall now the point made that the Norwegian team had bright gilt sights, which were not of service pattern, but no one objected. With me at the gathering were Secretary Jones, of the National Association here, who was billeted on our team as a member of our mess, and Vice-President Haskell, who was abroad at his own expense. On the morning of the match, the range officers made further and customary official examination of our arms in every respect, and not the slightest whimper of a protest was made. Our boys worked together beautifully. It was this application of our old-time team system that won us the contest. The London Times said with truth: 'No better disciplined set of men were ever seen on a rifle range.' We came back from 800 yds. 3 points behind the Britishers. The wind was fluky, and I had Cook practically waste a shot to determine the windage and elevation. He got an outer, but the others had the advantage of his shot, and in a lull of the breeze we got in a dozen bullseyes, and this gave us a lead which assured our success. We came home after overwhelming hospitality had been showered upon us by the most distinguished military officers, noblemen and civilian riflemen in Great Britain, and then, somewhere in an American out-of-town paper, there appeared an anonymous letter saying that our rifles had barrels of other than Government make. This letter, the writer, I am informed, sent to Secretary Crosse, of the English Association, and provoked a query from him. I should naturally suppose that a reply had been sent explaining that we had done everything in our power openly and above board in complying with the requirements of the Palma contest. It has always been the purpose in this great international match to develop the arm best suited for long-range military use. It has really been the recognized leader on this problem. Not one of the teams in the 1903 contest was armed with weapons from the ordinary Government ordnance stores. Special barrels and carefully selected ammunition of the regular Government pattern was the rule. The exception was the British team shooting a special charge of Cordite powder and selected bullets, each 10 grains heavier than the regulation ammunition.

"The British Government for half a century has had a proof house system, where small arms of all classes and by any makers are gauged and tested for strength. We have no such

precautionary board here. Instead, the name of the maker, say, Winchester Arms Co., Remington Arms Co., Stevens Arms Co., etc., as the case may be, is the American standard guarantee accepted for quality and safety, and thus far they have certainly made good. When tested, the British arm secured a 'view' mark as a sort of guarantee. I cannot see in the printed rules for the submission of arms any requirement as to styles of rifling. The rules of the Palma match, as amended by the British Association, permitted the use of rifles with the 'view' mark. This practically brought a class of weapons into use exactly similar to that which the American team was using; that is, arms which could take the Government ammunition as to strength, caliber, weight and length of barrel, etc., but which being turned out in various grades of nickel, Krupp and other steels, at great expense, with more care, by private makers, gave the shooter a confidence he might not feel with the factory weapon from the Government armories. The fact that we have no Government official authorized to stamp a 'view' mark on the rifle barrel was the small atom of objection behind which the British protest was made, a protest which was hinted at rather than expressed, and which the American management, to my utter amazement, grasped as an excuse for sending back the trophy and repudiating all that we had accomplished by our trip to Bisley last year.

"In the correspondence as I have recently read it, Secretary Crosse is compelled to acknowledge that no secret was made of the exact description of the rifle we were using, and in fact they were described in the most minute detail in FOREST AND STREAM here and in many of the excellent English publications devoted to the art of rifle shooting. These were all prior to the shoot. Instead of making a straightforward, manly and sportsmanlike protest as soon as the fact was noted, the secretary naïvely says in excuse for his remarkable silence for so long a period after the match, 'that it would be offensive to a competing team to assume that they intended to commit a breach of the rules unless prevented by a protest. It is obvious that if all competitors were to feel at liberty to infringe rules in the hope that objection would not be taken, it would be impossible to preserve good feeling in any match.' Yet in another part of his communication Secretary Crosse acknowledges that he had at hand an official sample of the very latest model of the United States arm, which has since supplanted the Krag-Jorgensen. Of this rifle, the New Springfield, he is emphatic, writing 'it could not have been allowed, although issued to troops for service, as it was not eligible under the rules of the match.' Now, to be consistent in his own position, knowing as he might, could, should and did, all about the rifle which was used, why did he not object, and in the absence of that preliminary formal protest, which was his duty rather than his privilege, did not his carefully preserved silence then virtually declare our rifles entirely eligible?

"It would be interesting to know just why all this information was held back until after the American team, against really tremendous odds, had managed to capture the trophy; and further, why, under cover of an anonymous newspaper letter, the carefully worded queries were put out.

"What I specially protest against is the excuse given on this side for sending back the emblem, to wit: That the captain (myself) had failed to comply with the instructions given him to submit both the Government and the special barrels to the range officials and get a ruling as to any possible objections. As Gen. Spencer, who makes this assertion, knew at the time, we went abroad with but one set of barrels. They had been used in our team practice here and a year before (September, 1902), when the British team won this very trophy at Ottawa, Secretary Crosse being present, one of these so-called Pope barrels was used by Dr. Hudson, of the American team, while two other members of that team, Capt. Graham and Lieut. Casey, used specially secured samples of the new Springfield, now the United States arm, but not then an adopted pattern. No protest was then made, though a British team shot, but the American team at that time failed to win—perhaps that makes a difference.

"Yet, after all, while I am naturally indignant that our work should have been practically undone, in such a shabby fashion, too, I feel it more on behalf of the boys who won the match under my captaincy. They were as representative a group of American gentlemen and soldiers as ever went out to uphold the honor of our country. Perhaps it may be for the best in the end, as it effectually disposes of those who would belittle unselfish efforts where their own petty schemes are interfered with. It may help to bring a set of conditions about which there can be not even a shadow of a quibble, and make good the words of the official captain of the English team, Maj. Fremantle, in a complimentary speech after the battle that he was glad 'the Palma trophy match was one in which every refinement of invention could be used or introduced and in consequence a great deal was to be learned from these international matches.' I shall always remember with pleasure one episode of our trip to British soil. It was the invitation from our Ambassador, Mr. Joseph H. Choate, to have the team pay a special visit to the American Embassy in London. A distinguished and representative body of British army officers had assembled, and an afternoon and evening of rifle talk was indulged in to our mutual advantage. I particularly recall the venerable Earl of Wemyss, who, as Lord Elcho, established years ago the Elcho Shield match, from which sprang the Palma contests, a series which he was proud to say 'had helped inculcably in bringing about that almost perfect arm of precision, the long-range rifle of to-day.'

"There is only one thing to do now, and that is to at once put under way such measures as shall bring that trophy, at the earliest opportunity, back to America.

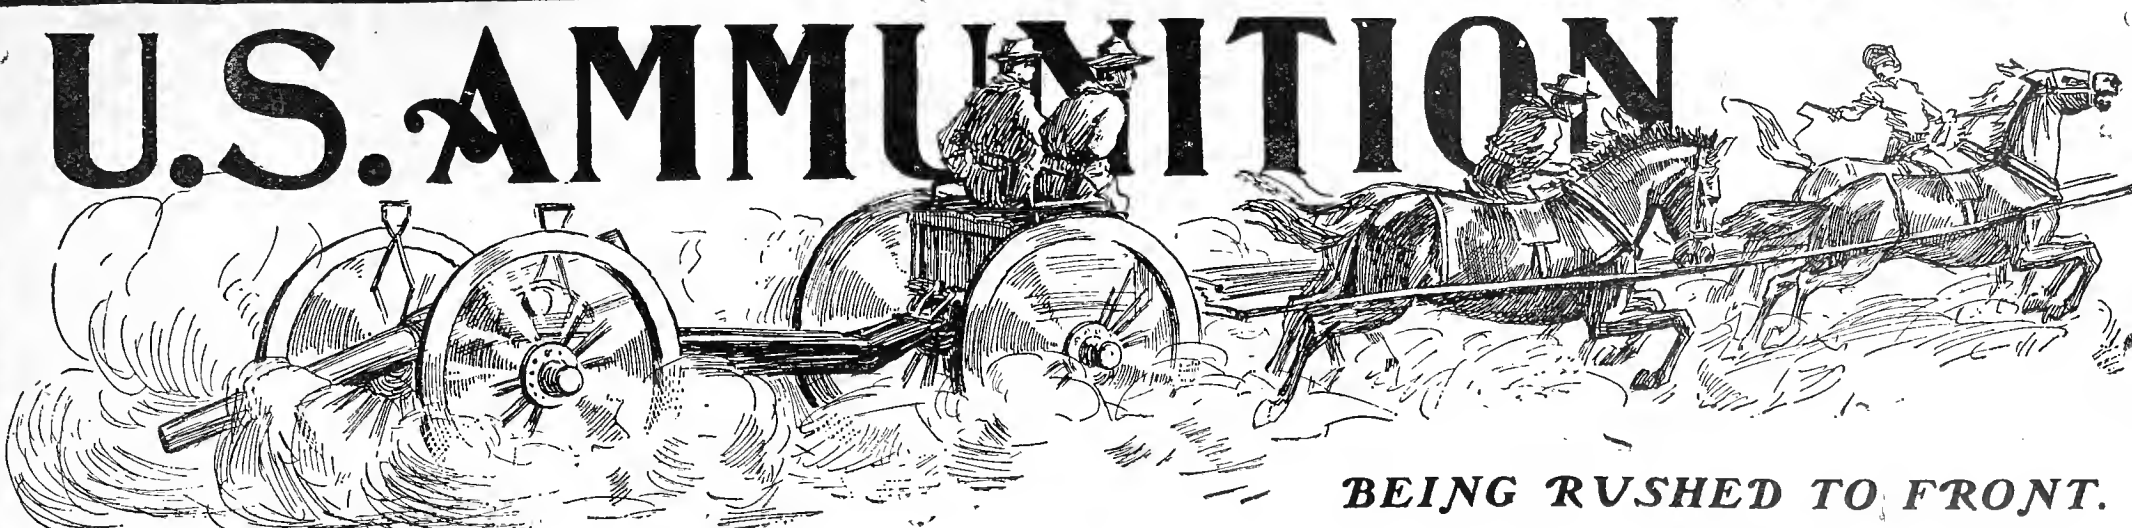

"In the making and shooting of long-range rifles, we have time and again shown our superiority to the citizens of any other nation. There are scores of Americans ready to make up at any time a capable team. I can speak almost as a veteran now, though in 1875 I was the junior member of the famous team captained by Judge Gildersleeve, and incidentally, if you will pardon a touch of conceit, there is a certain total of 219 in a possible 225 to my credit, made against the British team under Sir Henry Halford in September, 1877, which still remains the top-notch match score over the Elcho-Palma distances, 800, 900 and 1,000 yards. I do not speak now to stir up any further discussion of an episode which, on behalf of others, had better remain closed; but I take this first opportunity to correct any erroneous conclusions which my silence might bring about. I would rather look forward than backward, and I see in the future a long series of well-fought contests for this now famous shield with the Americans, giving a good account of themselves in arms and men."

Mr. Baker's Excellent Skill.

A CORRESPONDENT writes us as follows: "Some phenomenal rifle shooting was recently done by Mr. Chas. L. Baker, of Cox's Mills, a few miles north of Richmond, Ind. Mr. Baker already has a considerable local reputation for

WESTERN TRAP.

MARSHALLTOWN, Ia., Oct. 15.—The writer is pleased to mention a tournament where everything worked liked “oiled joints.” When grounds are perfect, traps face the north, and targets are perfectly thrown, then all feel happy when they are “hitting em.” Seventeen men shot in one 20-target event, and all but 2 targets were broken, which was 96 per cent for the whole event. Did you ever hear of anything to equal that?

Gilbert made 104 once, then 105 next for runs. Same time H. G. Taylor made 119. No wonder they registered each high professional and high amateur.

Weather good. Some rain the second day, but did not hinder big scores being made.

Much credit is due the Marshalltown Gun Club members, for they do things correctly. Gilbert, Budd, Whitney and Sharp talked and showed up the goods for the leading companies. Scores.

Oct. 13, First Day.

Wheatly, Ont., Oct. 19.—The name Wheatly has not appeared much in the sporting press. But yesterday there was a large number of bluerocks broken by those present. Most of the contestants were out of practice. The weather was not good, hence the scores are small as compared to what the same shooters have done in the past.

Mr. H. Hickson made 20 out of 25. Mr. McLean was one to the bad. M. T. Rogers made 17, A. Shippe 16, and G. D. Dobby 16.

Congress of Central Illinois.

Litchfield, Ill., Oct. 20.—The last shoot of the Congress of central trapshooters was held at Litchfield, on Oct. 18 and 19. During the summer the club has been unfortunate as to weather. The opening shoot was held in a snowstorm, and several of the fine shoots were dampened by rain and wind.

This shoot was held under the most favorable weather conditions ever experienced. The scores were not quite up to past form. Only John Boa was hitting ‘em square in the eye. Frank Riehl was getting on to the hang of a new gun, and he shot very regularly, getting two more the second than the first day. Standish and Bronough were present, representing their companies.

On the first day Cummings, Lawrence and Mulford each tied on 156. But on the second day Mulford won out and landed amateur average. Nine men shot through the last day. There was a difference of only three targets in the scores, 152 to 155.

The G. A. H. tie shooters came together here and made another tie. The management feel grateful for the support the amateurs have given them, and all the plans outlined by the officers have been faithfully carried out. It remains now to be seen what the year 1905 will bring forth. The officers agree that something better will be handed out when the robins come again. The scores:

	First Day.	Second Day.	Total.
Cummings, 18	156	154	310
Riehl, 18	156	158	314
Clay, 18	144	154	298
Boa, 18	164	163	327
Keller, 17	154
Scott, 17	152	152	304

Spore, 16	136
Mulford, 17	156	160	322

At Detroit.

Detroit, Mich., Oct. 17.—There was a large turnout at the Woodmere Club shoot, held here yesterday. Lamrand, of River Rouge, won the high average for the day. It was strange also to

see him third money in most of the events. The shoot was so successful that there will be a shoot held every Sunday.

In Other Places.

Whitmore won the trophy at the Rusch House grounds for the shoot of the Riverside Gun Club, of Detroit, Mich. He also won Class A on 22 out of 25. Summerfield won Class B on 22. Ebling won Class C on 19. Keller Class D on 13.

On Friday last the Freeport, Ill., Gun Club held a shooting outing. Some good scores were made, considering that the club has not been shooting for some years.

Dr. J. A. Wheeler, the Illinois State game warden, was at Bloomington, Ill., with the intention of participating in the McLean County Gun Club tournament.

The Pastime Gun Club, of San Diego, Cal., will soon hold a two-day tournament. The Los Angeles sportsmen are especially invited. The method of raising funds for money for the tournament held there last week is commendable. The members proved their liberality by subscribing \$300.

Of late another old gun club has come to life. This time it is that of Kankakee, Ill.

Quite an interest is being revived in trapshooting at Denison, Tex. Last Saturday there was a finishing up of all the live pigeons left over at the close of the tournament. The shooting proved a hot race, as Mr. Henry Beyer, of Arcadia, made a straight score of 40. Brown and Ambrose Mercer made 36 out of the same number.

The Adrian, Mich., Gun Club held an enjoyable shoot Wednesday.

New members were added to the Soo Gun Club at Sioux City, Ia., viz.: F. M. Lane, John A. Berry, R. F. Hanover and H. C. Dorton, the latter residing at Anthon.

James Gibson won the medal at the Los Angeles tournament on 49 out of 50. J. E. Vaughn was second with 47.

Reports from the last shoot held at Bloomington, Ill., show that Clark Gideon won the gold medal with a score of 25 straight.

The secretary at Washington, Ind., reports that on Wednesday Graham and Smith made 15, Padgett 14, Read 13, Reinsel 12, Volin 7.

The fall tournament of the South Bend, Ind., Gun Club brought together Indiana, Illinois and Michigan shooters. Anderson, of Knox, Ind., won first, with 178 out of 195 targets. Henderson and Shepardson were only one behind.

J. P. Speer, who is managing the tournament at Taylorville, Ill., reports that the nimrods of the State are coming in full force to the annual tournament.

The White Haven Gun Company, of Shelby, Tenn., has started with \$6,000 capital stock. J. B. Hildebrand, J. W. Hale, W. B. Van Hook, J. H. Van Hook, C. B. Hildebrand, J. N. Beasley and E. W. Hale are the incorporators.

The Mulligan Shooting Club, of Ottawa, Ill., is composed of Emil Bossenin, Paul Zickler, Ed. Burns, Jule Zellers, John Britt, Henry Metzger, Tim Crendon, Wm. Dunn and Riley Mooney. Their opening picnic is reported to be the best ever they enjoyed.

The opening shoot of the Spring Bank Gun Club, a new organization at Louisville, Ky., was held Friday. W. W. Watts won the hunting coat, and Frank Pragoff the gun case. J. C. Bond shot so well that he tied in both, but lost in the shoot-off. This club will shoot for five successive weeks, the prizes being two hammerless shotguns.

When the Crescent Gun Club, of Evansville, Ind., met last week the attendance was gratifying. Chris. Heuer shot so well that he captured the main prize.

Dan Bray, the veteran Nebraskan will attempt to take the Denver Post trophy away from George Carter. The shoot will be held at Lincoln, Neb., in the near future. There seems to be some irregularity as to the way some of the shoots for the medal have been held. But Mr. Bray took the proper steps by notifying the Denver Trap Club.

H. G. Taylor, of Meckling, S. D., was the high man at the Iowa shoot held at Marshalltown. He did not miss once during the forenoon.

Garfield Gun Club.

Chicago, Ill., Oct. 22.—The appended scores were made on our grounds to-day on the occasion of the fourth trophy shoot of the fourth series. Dr. Meek won Class A trophy on 23. Birkland, Jr., won Class B on 19. Gould won Class C on 17.

After the trophy shoot, Stone and Kamp captained teams formed by choosing sides.

The day was an exceedingly trying one for target shooting. A very strong north wind caused the flight of the targets to be extremely erratic, and made high scores out of the question. Attendance was good, considering the lateness of the season and ducks on the wing.

Trophy shoot, 25 targets:

Hamilton Gun Club.

The Hamilton, O., Gun Club held their annual tournament on Oct. 18 and 19. The attendance was not what the club had a right to expect. They offered a most excellent programme, with good division of purses. The only outside club to be represented was the Cincinnati Gun Club, which sent a squad of five men: Gambell, Medico, Peters, Barker and Pohlar, and they did the club credit.

J. C. Hamann, “Uncle Julius,” had charge of the office, and everything ran smoothly. All moneys were ready for the shooters a few moments after the close of each event. Mr. Len Shepard, of Cincinnati, acted as referee, and gave satisfaction in all cases.

The weather on both days was perfect.

The trade was represented by D. D. Gross and R. L. Trimble. The programme consisted of eight events at 15, two at 20 and one at 25 targets on each day; entrance at rate of 10 cents per target. Scores first day:

Shot at. Broke.		Shot at. Broke.	
Snow	185	Conrad	185
Peters	185	S Myers	90
Medico	185	Ayres	65
Gambell	185	Forsman	35
Stickels	185	A J	17
Parker	185	Smith	15
Link	185	Baron	25
Pohlar	185	Reed	25
Steinman	185	Mrs Ayres	15
Barker	185	Borch	25
Trimble	185		10

On Oct. 19 seventeen men were entered, ten shooting through. Snow was again high gun with 180. Peters second with 173. Trimble third with 171. Steinman fourth with 168.

Peters and Gambell shot against Parker and Stickels, of the home club, \$2 entrance per man, and again the Cincinnati boys made good by a margin of 20 targets.

The programme was finished about 3:30, and as a wind-up for the two days’ sport a seven-man team match at 25 targets per man, 50 cents entrance, was shot. After this shooting at doubles and singles was indulged in until dark, when all left with expressions of satisfaction for the good time they had enjoyed.

A large number of spectators was present each day, and among them were several ladies, who enjoyed the sport equally with the men.

F. H. Snow was high gun for the tournament with 360 out of 370, or 97.3 per cent. Snow did exceptionally fine work, centering his targets perfectly and never leaving any doubt as to whether it was a “dead” or “lost” bird. Peters, of the Cincinnati Gun Club, finished second with 345, or 93.2 per cent. Parker, of Hamilton, was third, with 332 or 89.7 per cent. Gambell, fourth, with 331, or 89.5 per cent. The scores, second day:

Shot at. Broke.		Shot at. Broke.	
Snow	185	Parker	185
Peters	185	Ayres	75
Trimble	185	Schumaker	90
Steinman	185	Mrs Ayres	30
Gross	185	Smyers	35
Gambell	185	Smith	30
Link	185	Cummins	30
Stickels	185	Will	35
Bercaw	185		16

General averages of two days:		Shot at. Broke.	
Snow	180 180	Trimble	157 171
Peters	172 173	Stickels	167 159
Parker	165 167	Link	163 161
Gambell	168 163	Steinman	158 164

Cincinnati Gun Club.

Cincinnati, O.—There was a fair attendance at the grounds on Oct. 22. The weather was cold and cloudy, with several showers,

A strong wind blew, but some good scores were made, notwithstanding. In the cash prize event, eighteen shooters took part. Faran was high man, with 44, Dreihls and Reed not being in the competition. A team match was shot between four two-man teams, 50 targets per man, two high teams out.

Chas. Dreihls led in the main event with 46, and D. D. Gross close up in the same event.

Ackley is at Duck Island, Ill., where he is smashing ducks instead of targets.

Eighty entries are in the cup race. No scores were shot to-day, and it looks as though Faran had a cinch.

Jay Bee is confined to his bed, quite seriously ill.

Gambell has something brewing for Thanksgiving Day.

Cash prize shoot, 50 targets, distance handicap: Dreihls (16) 46, Reed (16) 45, Faran (20) 44, Roll (19) 43, Gambell (16) 43, Medico (18) 42, Block (18) 42, Herman (18) 42, Gross (16) 42, Peters (19) 40, Maynard (19) 40, Andrews (16) 38, Du Bray (16) 37, Falk (17) 36, Myers (16) 36, Keplinger (16) 36, Tuttle (16) 30, Cottingham (16) 26.

Notes.

The Tipp Gun Club, Tippecanoe City, O., had as visitors on Oct. 20 Messrs. R. L. Trimble and D. D. Gross. Each took part in the medal event and scored 25 straight. The medal event was won by Hawver, after three shoot-offs.

The Hamilton, O., Gun Club held its last regular shoot of the season on Oct. 20. This was the fifteenth contest in the series of medal shoots, and eleven shooters faced the traps. Parker was high gun for the day with 44, Wesley a close second with 43. The conditions of the medal shoot were fifteen contests in the series. Members must shoot in ten or more events in order to qualify, and the one having the largest aggregate of ten best scores wins the badge and first prize. The club gives \$100, which is divided among those qualifying in proportion to their ten best scores.

The fourteenth semi-monthly shoot of the Indianola Gun Club, Columbus, O., was held on Oct. 15. Members were away duck, dove and snipe shooting. J. Y. Bassell, Jesse Smith and two of Newark's cracks, Messrs. Fisher and Taylor were present as guests of the club, and the latter's work was a feature of the day, he losing but 2 targets out of 50. Bossell had never shot at clay targets before, and made a very good showing.

The Licking County Gun Club, of Newark, O., has challenged the Indianola Gun Club, of Columbus, O., to shoot a six-man team race at 50 targets per man, for the price of the targets. The match to take place at Hebron, O., on Oct. 26 or 27.

The Portage County Gun Club, of Ravenna, O., will hold its last shoot of the season on Nov. 3. A 100-target match for the championship of the county is open to all shooters in the county.

The Rohrer's Island Gun Club, of Dayton, O., held their regular medal shoot on Oct. 19. The medal event was won by C. F. Miller, after four shoot-offs. This gives him the silver loving cup.

There was a small attendance at the regular medal shoot of the Welfare Gun Club, Dayton, only four men competing, and only nine shooters being at the grounds. On Thanksgiving Day a grand turkey shoot will be held. Shooting all day.

E. D. Fulford.

THE following is a clipping from the Utica Daily Press of Oct. 19, which we deem to be of interest to the hosts of friends of the late E. D. Fulford. It shows the profound esteem in which he was held by his fellow men:

"There was a very large attendance of friends at the funeral of Elijah D. Fulford yesterday. Services were conducted by Rev. James D. Corby, of the Church of the Reconciliation, at the family residence, 715 Genesee street, at 2:30 P. M. The members of the Oneida County Sportsmen's Association attended in a body. The Oriental Quartette, consisting of E. H. Stewart, Robert J. Hughes, A. Spencer Hughes and F. E. Swancott, rendered several selections. The esteem in which Mr. Fulford was held was shown by the many large and beautiful floral tributes, including a standing column, four feet high, from the Oneida County Sportsmen's Association; plaque of roses and palms from the Bre Powder Company; large standing wreath from the employees of the Remington Arms Company; large pillow from the Union Metallic Cartridge Company. The bearers were Frank E. Butler, of Nutley, N. J.; J. S. Fanning, Jersey City, N. J.; J. G. Heath, Madison, N. J.; C. R. Mizner, Clarence C. Boff and Charles Windheim, of Utica. Interment was made in Forest Hill Cemetery. Of the bearers, Jack Fanning represented the Lafin & Rand and duPont Powder companies, at Wilmington, Del.; Messrs. Butler and Heath, the Union Metallic Cartridge Company, with plant in Bridgeport, Conn., and main office in New York city. They came to Utica as representatives of the company, especially to attend the funeral, all being personal friends of the deceased. Before returning home, they spoke in highest terms of Mr. Fulford, and said that had it been possible a large delegation of trapshooters would have been present at the funeral, among whom he had very many friends, by whom he will be greatly missed."

The duPont Powder Company and the Lafin & Rand Powder Company sent a large bed of flowers. Mr. Ed. Banks, of the duPont Company, sent a floral design, and Mrs. F. E. Butler (Annie Oakley) sent a wreath of ivy and roses.

Indianapolis Gun Club.

INDIANAPOLIS, Ind.—The fall tournament of the Indianapolis Gun Club, held on Oct. 12 and 13, had a good attendance. Mr. A. S. Flinn, of Wabash, Ind., shooting under the name of Fleming, won the English Hotel cup with a score of 87 out of 100. Mr. Ed Rike, of Dayton, O., was second with a score of 85, and also was amateur high gun in the merchandise events. With Mr. Ed. Voris he was amateur high gun in the two days' programme. Mr. W. R. Crosby was high gun in the professional class. The totals of the two days are appended:

Warwick Gun Club.

WARWICK, N. Y., Oct. 15.—The sixth and last shoot of the season of 1904 of the Warwick Gun Club was held Oct. 14. The weather was fine and a good day's sport was had. There was a strong wind blowing across the platform, and the result is a number of low scores. Following are the scores in detail:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	10	15	10	15	10	15	10	15	10	15	15	15

JOHN B. ROGERS, Capt.

Avon Gun Club.

AVON, N. Y., Oct. 20.—At the fourth annual tournament of the Avon Rod and Gun Club the attendance was small, owing to the game season. Many are away on hunting trips. Greene, of Avon, won first average; Curtis, of Le Roy, second; Spalding, of Cohocton, third. Greene shot poorly in the morning, missing 14 of the first 70; then breaking 126 out of 130, with a run of 68 straight. Curtis shot in good form, as this is his first year in the shooting game.

JAY D. GREEN, Sec'y.

Recreation Rod and Gun Club.

GRAYVILLE, Ill., Oct. 13.—The weather was fine, though the day was rather windy. There was a good crowd, and the shoot was a success. The experts, Messrs. Riehl, Boa and Dreihls, were present. The scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	Shot

Rochester Rod and Gun Club.

ROCHESTER, N. Y., Oct. 19.—Four of the seven contestants tied in the contest for the Hunter Arms Co. trophy, at the shoot of the Rochester Gun Club to-day, and each of the remaining contestants was but one short of the maximum. The scores:

Score. Hcp. Tot'l.			Score. Hcp. Tot'l.		
Bonbright	24	2 26	Stewart	24	0 24
Weller	22	4 26	Fraleigh	21	3 24
Watson	22	3 25	Riekman	18	6 24
Donovan	19	6 25			

There are four more shoots scheduled for the Hunter Arms Co. trophy. Two members have each obtained 5 points toward the trophy, and several others have 3 and 4 points apiece. The last contest is to be held on Nov. 16.

Mountaineers Gun Club.

CHATTANOOGA, Tenn., Oct. 17.—At the regular weekly shoot of the Mountaineers' Gun Club on Saturday, 15th inst., Mr. Tony O'Connell made the remarkable score of 108 out of 109 targets thrown fully 55yds. from three expert traps, Sergeant system. He made a run of 82 straight, and finished his score with 123 out of 125. Livingston, of Alabama, was a guest of the club, and also did good work. Following are the scores:

SECRETARY.

PUBLISHERS' DEPARTMENT.

World's Fair Scenic Route.

BECAUSE of its magnificent mountain, river and cañon scenery, its famous battlefields, and points of interest, and because of its superior equipment and physical condition, providing all the comforts and safeguards of twentieth century travel, the Chesapeake & Ohio is unquestionably the most attractive route between the Atlantic Seaboard and the Mississippi Valley. World's Fair and through tickets by this route allow stop-over at Virginia Hot Springs and Greenbrier White Sulphur, the two most fashionable and famous mountain resorts in the country. Solid trains Washington to St. Louis, with New York connection via Pennsylvania Railroad.—Adv.

The Feathered Tribe.

THE wife of a Methodist minister in West Virginia has been married three times. Her maiden name was Partridge; her first husband's name was Robin; her second Swallow, and the present one Quayle. There are now two young Robins, one Sparrow and three little Quayles in the family. One grandfather was a Swan, and another was a Jay, but he's dead, and is a bird of Paradise. They live on Hawk avenue, Eagleville, Canary Islands, and the other fellow who wrote this article

MONOLOGUES OF KIAH.

IN a tent, pitched in a beautiful nook of the wildwoods, five men, comfortably curled up in their bunks about 11 o'clock at night, were sweetly passing away into dream-land, when Hezekiah Bellowson, one of the number, and complaisantly voluble, began his nightly monologue as follows:

"Say, fellows, don't you think this election has more isms than any other election that you ever saw or heard of, and that it's about the most important thing that ever was? What I don't understand is that each ism is different from every other kind of ism, and what flabbergasts me is that every ism, when a fellow studies it up, seems to be all right. Are you fellows all asleep? 'Shut up!' you say. 'Shut up, Kiah!' and 'Cut it out, Kiah!' seems to be about all the conversation that you fellows have for Hezekiah Bellowson. Kiah don't shut up to-night, nor any other night, for nobody nor nothing, if the court knows herself, and the court thinks it does. Here it is time to elect a President of these great and glorious United States which made the American eagle famous in the emblem business, and all that you fellows seem to live for is fishing and eating and sleeping and prattling about fish and flies and bait and bugs, and saying 'Shut up, Kiah!' I'd like to have you understand that this is the time of the year when every true American citizen must speak out in clarion tones for principle's sake, knowing that he has the right of free speech at all times and everywhere, and which is according to the Constitution of the United States, sealed with the blood of our dear forefathers, most of whom were in Europe at that time, and which guarantees forever that the right of free speech of the citizens of this free land shall never be impugned. When our best men, our thinkers and patriotic statesmen, every four years find that the Union is foundering and floundering, the least that we can do as patriotic citizens is to have numerous heart to heart talks over the matter and find out whether the ship of State has been scuttled or naturally has sprung a leak or is under full sail pointing for a rock. According to my way of thinking, that's about what these isms mean, though they don't say it quite that way; but I tell you it's a puzzler in my mind where all these isms come from. Who makes the isms, or do they come up sort of naturally like? After all, I suppose that some wise chap thinks them out for millions of people and that such good thinking is its own reward; or perhaps the horny-handed sons of toil or velvet-handed sons of leisure discover them by instinct, and then tip the wink to the rest to shout it out. I was talking to my wife about the dangerous state the country was in on account of capital and labor being blind to the truth that their interests were the same, if they could see without being blind; and she allows as how capital and labor are one big family with interests which are just alike; and she's right; for their interests are just precisely alike if I know anything about it, for capital is interested in getting all it can for the least money and labor is interested in getting the most money it can for its walking delegates, which are captains of industry. 'Shut up, Kiah!' 'Cut it out, Kiah!' Get a tune to that and sing it, for I do believe that you fellows are just about mean enough to prefer it to the 'Star Spangled Banner' or 'Dixie.' If one of you had been a forefather, I'd bet my last dollar that there wouldn't have been any freedom of speech in the Constitution of these United States unless the subject was about some old trout or bass-rod, or the biggest fish that ever was caught if it hadn't cut the line with a stroke of its tail and faded away. You are the kind that help to build up a language. You brought in a word that is in common use. When a man hears a statement and says that it is 'fishy,' he owes you a debt for a useful word, the meaning of which is known even by the illiterates, and that reminds me of the election on which you fellows seem to have no more interest than a gargyle. I suppose you are that very important class called the silent vote, the sleeping power that decides the election and saves the country for a period of four years, for that is the limit of safety, blocks of four. No, I won't be still till I get good and ready, now. If you'd asked politely, I'd have waved my privilege as a freeman and a free speaker to oblige you for friendship sake, even at the cost of my patriotic emotions, which are just the same kind that our forefathers

had when they fired the shot which was heard clear around the world, not forgetting the respect due to a long shot with the long bow. Well, if you're all going to raise a riot about it, I suppose I must stop; but I do it without any prejudice to my immortal and glorious rights as an American citizen whose forefathers fought and fished—and I don't care a hang if you do hope I choke. Perhaps the country is safe, anyhow, for the ship of State has weathered every storm of the great elections since all men were born equal and the freedom of speech was guaranteed to the proud or the humble man, regardless of sex, condition or occupation. So I'm going to sleep, fellows. So good night."

A NON-RESIDENT LICENSE CASE.

WE print in our shooting columns the text of the opinion handed down by the October term of the Illinois Supreme Court in a hunter's license case. Attention is called to the opinion because it deals with a question which is constantly raised, namely, the constitutionality of the law which discriminates to the disadvantage of the non-resident, and deprives him of rights which he assumes to possess.

Some of the conditions attending this case were considered by the appellant to be strongly in his favor. He was a member of a shooting club which owned the land upon which the shooting had been done; and the contention in his behalf was that as a land owner he was entitled to shoot without a non-resident license under the proviso of the act which prescribes that "the owner or owners of farm land, their children or tenants, shall have the right to hunt and kill game on the farm lands of which he or they are *bona fide* owners or tenants * * * without procuring such resident license." The court overruled this contention, however, on two grounds. A stockholder in a corporation possessing real estate, it holds, is not a land owner within the meaning of the act; he is only the holder of shares of stock, which are personal property rather than realty, and the possession of which gives the holder nothing of the character of a real estate holder. And the second ground was that the property of the club, being preserved and used as a shooting territory, was not farm land; and only farm land was specified in the clause of exemption.

Another provision of the Illinois law is that nothing in the act "shall apply to persons hunting on the land of another person by invitation of such land owner." In an endeavor to avail themselves of the privileges accorded by this provision, the members of the shooting club, to which the appellant belonged, and which was the owner in fee simple of its shooting territory, had adopted a formal resolution inviting each member and stockholder to visit the club grounds and shoot, as invited guests of the club. But the court held that this provision was not limited to section 25 relative to non-resident shooters, but applied to the entire act; and if held to be valid, would nullify the entire statute as to modes and seasons. In accordance with the rule of construction of statute, that "a saving clause must be rejected when it is directly repugnant to the purview or body of the act, and cannot stand without rendering the act unconstitutional and destructive of itself," the court ruled that the clause must be held invalid; and did not constitute a defense for the appellant's act.

So much for the special circumstances of the case.

The broad questions involved in this, as in all non-resident shooting license laws, were as to whether the statute was unconstitutional because violative of section 2 of article 4 of the Constitution of the United States, which declares that "the citizens of each State shall be entitled to all privileges and immunities of citizens in the several States;" or of section 1 of the Fifteenth Amendment, that no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States," etc.; or of the section which gives Congress the exclusive power to regulate commerce among the several States. As to these points, the court held that while the question of constitutionality was not properly before it for decision, "an examination of these several objections to the validity of the statute will lead to the conclusion that neither of them can be sustained; and we are clearly of the opinion that the trial court ruled properly in holding the statute valid."

The action of the Supreme Court thus establishes the integrity of the Illinois non-resident license law, even to the extent of prohibiting the non-resident members of a club owning a game preserve from shooting on their own lands without a license.

THE WILD DUCK IN POLITICS.

THE wild duck supplies a burning political issue for Long Island this year. Adherents of all political parties are united on this one question. With practical unanimity they demand a repeal of the present law, which forbids the shooting of ducks between January 1 and September 30, and ask for the restoration of spring shooting. The duck question transcends every other; one may readily perceive this by going among the South Siders and noting the all-absorbing topic of conversation.

There is on Long Island a large class of baymen whose mode of livelihood has been developed from the duck shooting conditions formerly prevailing there. They get their living from the water, and before the enactment of the present law an important part came from the patronage of city duck hunters who resorted to the island in the spring months. The amount of money a bayman handles in the course of the year is not large, measured even by the most modest standards, and that share of it which was contributed by the sportsmen for board and boats and guides and ducks was in corresponding degree an important part of the whole. When the law against spring shooting went into operation, it cut off just so much ducking revenue, and the loss has been severely felt. Resentment is intense. It was inevitable that the Long Island baymen should make the duck shooting question the leading political issue of the year, and should weigh the merits of candidates with an eye to their attitude on this subject; or, to speak more accurately, with a consideration of the respective ability of the several candidates to secure what Long Island demands in the way of ducking legislation. Both candidates for the Senate, Republican and Democratic, have declared themselves as sound on the duck question. Senator Edwin Bailey, Jr., who is seeking re-election on the Democratic ticket, has a record of strenuous opposition to the Brown bill in the Senate last winter, and his friends claim for him that he did all that anyone could have done to secure from Long Island exemption from the obnoxious measure. His failure is ascribed to the fact that he was of the minority party in the Legislature; and his plea for re-election as an advocate of the duckers' rights is based upon an assumption that the coming Legislature will be Democratic, under which conditions it will be possible for him to carry his point. For Carl S. Burr, Jr., who is the Republican candidate for the Senate, it is urged, on the contrary, that the Legislature will again be Republican, and that it will be absolutely essential that Long Island should be represented by a Republican, who, having a majority behind him, could accomplish what Senator Bailey was powerless to do in the late session, and, under the Burr assumption, would be powerless to do this winter.

THE city of Detroit has added to its handsome park system a large aquarium, built and equipped at a cost of \$164,000. The enterprise was prompted by a visit of Representative David E. Heinman to the Naples aquarium, seeing which he conceived the idea that such an institution would be a valuable addition to the park attractions of his native city; and it was due to his efforts in the Legislature that the city was authorized to issue bonds for the purpose. The design was chosen by competition, under the guidance of a select committee of experts, so that the building embodies the most modern and perfect aquarium features as to arrangement and equipment. In size it is the third largest in the world. Provision has been made for both fresh and salt-water fishes; the salt water supply, 30,000 gallons, having been transported in tank cars from Wood's Holl, Mass. This water can be used over and over again for years.

ONE cannot help reflecting that Admiral Rojestvensky would be a most exhilarating companion to go shooting with in the brush. He would very likely see things, and in that event he would surely make it interesting for the rest of the party.

THE SPORTSMAN TOURIST

My Burglar.

I CAN remember when I wore dresses, and long yellow curls like a little girl, but cannot remember when I did not love a gun.

Toy guns satisfied my early childhood, but with my first pair of pants came the longing for a real gun, which rapidly increased as I grew older. My brother Will, two years my senior, was possessed with the same longing, and by the time I was nine and he eleven years of age, we had come to seriously consider ways and means of acquiring a gun. Our father was very positive in his refusal to assist us in any material manner, and even went so far as to forbid our attempting it ourselves, considering us too young to be trusted with a gun.

Inclined to obedience, we gave the matter up for a season, but could not bring ourselves wholly to abandon it.

One day brother Will came to me in great excitement, saying he had found a gun that could be bought for one dollar and fifty cents, and that we must set about raising the money at once, before some one else secured the prize. It was a large sum of money for us to get together, and it cost much thought and labor to do it, but the possibility of owning a gun stimulated us so that we speedily accomplished the task, and one fine morning purchased and proudly bore home our first real gun. It was an antiquated army musket, rusty and battered, but to our eyes all that a gun ought to be.

We found it a heavy load to carry, but no burden was ever borne more cheerfully. A careful and critical examination of our treasure, after we had gotten it safely home, developed the fact that it was so heavy neither of us had the strength to hold it out in firing position. But Will solved this problem by suggesting that we could shoot from a rest on some convenient stump or fence.

Then on further investigation we discovered that neither of us was tall enough to reach up to the muzzle of the gun to pour in the powder and shot with which to load it. This was more serious, and not so easily remedied as the first difficulty. I suggested that we might carry a box with us to stand on when loading, but this plan did not seem quite practical, and was not very well received by my brother. "It is all we can do to carry the gun, without lugging a big box, too," said he. "And who ever heard of anybody going hunting with a gun and a box to stand on when loading it?" he rather indignantly inquired.

I think the fact of its being so unorthodox, rather than its novelty, caused us to dismiss it as wholly impractical; for we could not consider any method not approved by sportsmen, now that we had a real gun.

We finally consulted an old gunsmith, telling him our troubles, and he advised that we have the barrel of the gun cut off, thereby reducing the weight and length, and agreed to do the job himself for the modest sum of 45 cents.

We promptly resolved ourselves, for the second time, into a ways and means committee, and after a few days of earnest financiering as ever fell to the lot of men engaged in an enterprise of importance, we sallied forth to the gunsmith's with our gun and the price of the desired improvements.

With something like two feet cut off the barrel, and the same from the iron ramrod, we had an arm that either of us could hold—very briefly—in firing position, and readily reach the muzzle of from the ground.

Cocking our gun gave us much trouble at first, but this we finally learned to do by resting the muzzle on the ground, bracing the stock against our chest, and pulling on the ponderous lock with both hands. The sound of the two "clicks," announcing the stages which we knew as "half" and "whole cocked" was thrilling in the extreme, bearing a strong resemblance to the noise made by a heavy fire-set falling on a stone hearth. It was simply sweet music to our ears, and we knew that no gun ever had a stronger, or more business-like click.

It was some time before we could persuade our father to allow us to test its shooting qualities; and when we did, our further knowledge of the gun, and its strong characteristic might be thus summed up: It had wonderful capacity for ammunition, taking a handful each of powder and shot, at a load, with a handful of paper on each. A very loud and booming report, when fired. A recoil, which led us seriously to consider, at times, whether or not the propelling power had not—in some manner—become reversed; and the knack of scattering shot in a way beyond the power of belief.

We also discovered a little later on, that the threads of the tube seat were worn, and that occasionally the tube was blown out, whistling by our heads with terrific force, and not killing us—although occurring several times—simply and solely because of the kind and all-wise Providence that especially regards the reckless boy.

But what a grand, good, beautiful gun that old iron wreck was to us, and how we loved it. The boy of to-day with his double hammerless, that has never cost him an effort beyond the request for it, knows nothing of real love for a gun.

I think we never killed bigger game than a robin—and few of those, I am thankful to say—but we be-

lieved our gun fully up to the mark on any kind of game, big or small; and as for burglars, we only wanted a chance to show that it was—above all things—a man gun. Many hours which should have been devoted to sleep did we devote to planning our campaigns against the burglar we were always expecting, often slipping out of bed and stumbling around in the dark to change the location of the gun to meet conditions changed in our discussions.

Our room was on the second floor of an L, and opened out on a back porch. This porch was inclosed below, but open and surrounded by a railing above. Steps led up from the lower to the upper floor and about midway the lower floor opened out on to the yard.

The other members of the family were absent from home attending an entertainment one evening, but my older sister was ill, and I was left at home with her for company. Her room was also up stairs, and next to the one we boys occupied. Left to ourselves, my sister was lying down, and I sat looking at pictures before the open grate fire.

A suspicious noise finally attracted my attention, and after listening a moment I slipped quietly out into my room to investigate. Seeing nothing there, and the noise continuing, I secured the gun and went out on to the back porch. I had opened the door very carefully, without making a sound, and when out on the porch could distinctly hear the noise which sounded as though it was on the lower porch.

Holding my breath, in mingled fear and excitement, I tiptoed to the edge of the porch and looked over the railing. The moon was shining brightly, making objects nearby plainly visible.

Immediately under where I stood was a man, and a very large one, I thought. Calmly, yet vigorously, he was working on the fastening of the door that opened on to the steps leading up to where I stood, and I at once realized that our long looked for burglar had come.

Together with my brother, I had planned, longed, hoped and looked for his appearance for days and weeks past, and now that he had come, and was so close—I could all but touch the top of his hat with the muzzle of my gun—I discovered that my feelings had suddenly undergone a radical change.

Instead of being delighted, I was truly sorry. Instead of being calm and self-possessed, as I had always felt sure I should be, I was shaking from head to foot with abject terror; so great was my fright it positively made me sick. I made a desperate effort to cry out, but only choked and gasped, making no sound. I tried to retreat into the house, but my legs refused to carry me.

With the now forgotten gun in one hand, and clinging to the banister with the other, I stood looking down on the man as he calmly proceeded to work at the door fastening, which I knew to be none too secure. Expecting every minute that he would effect an entrance, I now began earnestly to wish that I had left the gun in the house where it would not have been so convenient to his hand when he attacked me.

I could not say how long I stood thus, but know it seemed a very long time. The man was using some sort of instrument with which he worked at the fastening of the door, twisting and turning it in the lock, stopping every little while to push and gently shake the door to see if his efforts to force the lock had been successful.

Utterly unconscious of my near presence he worked away, while I watched him in fascinated silence. Each time he pushed and shook the door I expected it to open and let him in, but the fastenings held.

I finally began to recover from the first effects of my dreadful fright, and to wonder if it was not possible for me to shoot the man as he worked at the door. He was evidently a real burglar, and deserving of the most severe punishment.

As I seriously considered this matter, my courage increased, and I finally concluded to attempt it. Stepping up on the lower rail of the banister, I leaned over and, carefully lifting the gun over, lowered the muzzle until it pointed fairly down on the man, and was only a few feet from the top of his unconscious head. Trembling with excitement, I pressed the stock to my shoulder as I hung over the railing immediately over him and, with two fingers on the heavy trigger, began to pull with all my strength. Until fairly out of breath I tugged on the trigger, expecting every instant to hear the loud report and see the man fall dead, suddenly cut short in his awful career of crime. Ceasing my strenuous efforts finally, and pausing to get a better hold on the trigger, it suddenly occurred to me that the reason the gun had not gone off was the fact that in my excitement I had forgotten to cock it. My fears were now, for the time, forgotten, and I was all excitement for fear the man would discover me, and make his escape before I could kill him.

My youthful mind in no wise realized the awful deed I was contemplating, in deliberately attempting to kill the man. It but seemed a brave and heroic act. One for which all good people would praise me, and best of all, one which would make me the envy of all the other boys of the town.

Entirely forgetting the fearful racket made by the cocking of my weapon, I let go the trigger, laid hold

on the ponderous lock and tugged away with might and main. The excitement under which I was laboring lent strength to my arm, and the first desperate pull brought the gun to half-cock, although I was using only one hand, instead of both as I usually found it necessary to do.

If the gun had actually fired it could not have produced a more startling sound than the loud click! which announced it at half-cock.

As it rung out on the still night air, the burglar's head snapped back as though moved by an electric current, and I shall never forget the look of terror in the white face of the man as he suddenly looked up right into the muzzle of the gun pointing full down on him, and so fearfully near.

I was again overcome with terror at being suddenly so discovered by the man whose life I was attempting, and hung over him speechless and motionless, wondering what he would do to me.

For an instant he gazed fixedly, as though fascinated, into the muzzle of the gun, and then I noticed that he seemed to be settling down as if his legs were slowly sinking into the ground.

Then suddenly, with a shriek of terror that fairly split the air, and nearly caused me to fall over the railing, he sprang back with a mighty leap, which carried him fully twenty feet, and, turning, fled to the rear of the yard at top speed, leaping and dodging from side to side as he ran.

The yard was high in the rear, and protected by a retaining wall of stone, and above the wall, and a little further back, was a high board fence. Neither of these obstacles seemed to present the least difficulty to the fleeing man. He ran up the wall like a scared cat and fairly flung himself over the fence.

The street was steep and rocky in the rear, but I plainly saw and heard him continue his retreat with undiminished speed until he turned the next corner.

It then took me a very short time to get back into the house where I was glad to find my sister undisturbed, and quietly sleeping.

When the family returned and heard the story of my adventure, they all, with the exception of brother Will, sympathized with me. Will insisted that I was "a chicken-hearted chump," and said I did not deserve ever to have another good chance at a burglar as long as I lived, and I very frankly told him that I hoped I never would.

LEWIS HOPKINS.

A Trip to Ningp'o Lakes.

BY H. MATHER HARE, M.D., INTERPRETER SECOND BRIGADE, CHINA EXPEDITIONARY FORCE.

SHANGHAI, China.—For weeks we had anticipated it, and had longed for the day to come. Leave had been obtained from those in authority. Cartridges filled, guns in tip top order, and with everything "ready to the last buckle," behold us on board of the S.S. Chih Li, bound for the Ningp'o Lakes, and the ducks and geese, about whose numbers we had been hearing many tales, that we hardly dared believe.

To a new-comer the departure of the Ningp'o steamer would seem more like Bedlam than anything else, but as you watch the crowds of Chinese coming and going, you see that progress is being made toward order, in spite of the seeming confusion.

Peddlers swarm, of course, selling all kinds of horrible looking compounds to the deck passengers, with which to sustain themselves during the long cold night.

Several men, carrying tin cans full of hard boiled eggs, kept warm by pans of glowing charcoal, squeeze in between the throngs of hurrying coolies, until one wonders how it is possible for them to keep their feet. Some have taken the trouble to color the eggs a vivid red, reminding one of the Easter eggs at home. Sold at about five cents a dozen, with salt thrown in, they did not strike one as being dear; but no purchaser would think of giving such a price, without haggling over it, and saying "the eggs were small," "the price was too high," etc., etc., then end by paying it, as he knew in the beginning he would have to do.

Instead of 4 o'clock, it was an hour later when the ship's papers came on board and we were free to go. Once away from the wharf, the deck passengers began to settle themselves for the night, and spread thin bedding in what looked like a comfortable spot, never neglecting for a moment to curl themselves round their various baskets and bundles, as a partial safeguard against robbery. There being but two small staterooms, with one berth in each, for four passengers, two of us had to take the locker in the saloon, but with plenty of blankets from the steward we were fairly comfortable. It seemed as if there was a continual procession of Chinese "boys" tramping in or out of the saloon all night, getting a warm drink, or a lunch for some of the officers either coming off, or going on watch, and each time they came in, they allowed the door to slam, so that our sleep was of the fitful variety.

A cold bath in the muddy water of the Yang-tsz River, followed by a cup of tea and toast, made one feel like a walk on deck to see the sun rise; and in a few minutes up it came, changing the clouds to all sorts of shades, which—not being a spring poet—I will not attempt to describe.

The entrance to the Ningp'o River is guarded by

several strong looking forts, and the channel winds in and out between islands of different sizes, making what is really a very pretty bit of scenery. The morning was raw and cold, and the few Chinese boatmen, who crawled out of the huge staring-eyed junks to see us go by, looked the most forlorn objects in existence. A large city, Ch'ing-hai Hsien, lies on the left bank, and is a very busy place; just now it was asleep, and there was no sign of the hurry and rush that would obtain a few hours later. A few of the gaunt, half-starved dogs, that are so much part and parcel of a Chinese city, were hunting about the refuse heaps; the only sign of life.

Bunches of mallards and teal, and some small goggles of geese were soon to be seen flying back and forth, giving one's forefingers the trigger itch, so well known to those that love the gun.

A huge, but pretty curve in the river, rejoicing in the plebeian name of "Pawnbroker's Bend," had to be traversed, with its grassy banks lined with straw-thatched ice houses, then the old fort, now dismantled, dating from the T'ai P'ing rebellion is passed, and in the distance we soon see the masts of the junks, looking like a leafless forest, indicating that our short sea voyage was at an end.

These junks are often larger than a 100-ton schooner, and frequently have five masts. They are met with all up and down the coast, from Canton to Taku, and are managed very well by their heathen crews, to whom, of course, time is no object. We tied up to a pontoon, and then the mad scramble of hundreds of coolies to get off and a similar number to get on, commenced. Why dozens of laden coolies are not daily crowded off into the river, no one seems to know.

Our house-boat—arranged for before hand—was hanging to the pontoon, and it took our boys but a few minutes to transfer our baggage and make things snug. In a few minutes we are off up the river, with two men sculling behind and a man in front with a boat hook pushing or pulling on the scores of anchored boats, as the opportunity arises. In about an hour we passed under the huge bridge of pontoons, which is a very busy place, every available spot being occupied by sellers of fish, vegetables, etc., etc. A mile further up we leave the river and go into one of the many canals, and as the tide is too low for us to get to the foot of the Haulover, I will try and describe our boat and the way it is fitted.

The hull is flat-bottomed, somewhat scow-shaped, about 25ft. in length, 7ft. beam, on which a house has been built, covering some three-fifths of the length. The house is divided into four rooms; the first one we used for a dining room; the second, fitted with bunks and

in height. Before we had gone any distance, we heard wild geese, and on looking closely with our glasses we soon made out their black heads sticking out of the grass about three hundred yards off. There were hundreds of them, and as we watched them every wildfowler knows the feelings we experienced.

In our large, clumsy house-boat it was impossible to get near them, so we got out guns and cartridges and did our best to "possess our souls in patience," until our sampan men, with their small sampans or punts, should see our boat and come to meet it. This they soon did, and it did not take us very long to transfer ourselves, guns, and cartridge magazines, to two small flat-bottomed skiffs or sampans, and set out in our quest for the geese.

My friend J. opened the hall before I had gone more than a hundred yards with a right and left from his double 8-bore at a small gaggle of geese that flew out of a bunch of grass about a hundred yards off. I saw the sampan coolie pick up two, then paddle off after another that had left the flock, and with set wings had pitched a

ing flight, but not one could we see, though we could hear the whistling of their wings on all sides.

After a half an hour's waiting we thought we would try it, and we pushed ahead. What a racket the dried grass made on the sides of the sampan; one would think it would frighten every bird in the neighborhood, but it did not seem to make any difference. We had only gone a hundred yards, when up jumped something with a loud quack, and by holding somewhere near where the thing was, I managed to cut it down. On picking it up, we found it was a widgeon. Thousands of ducks and geese rose on all sides of us the instant the shot was fired; the roar of their countless wings was deafening, so we sat tight until the commotion was over, and the birds began to settle down again. A little further on a pair of mallards jumped, and as they crossed the shot met them, with the result that we bagged them both. A couple of misses at single teal fighting kept me from feeling too well pleased with myself, as one is apt to do after a rather clever shot.

With varying success we pushed here and there through the long grass, getting shots at all kinds of angles, and were pleased to see the pile of birds growing larger. Two consecutive shots at mallards at about fifty yards struck all right, but both birds flew off, apparently unhurt. We watched them closely, and when they had flown about two hundred yards they collapsed dead in the air, and we gathered them both, but only after a long hunt in the thick grass.

Toward evening we went to the place where some geese were in the habit of feeding, and as we got near enough we could see half a dozen feeding. We pushed through the long grass as carefully as possible until we reached the limit. From this point to the geese was fully a hundred and fifty yards, and it was useless to fire. Settling myself in the best position, I told the man to push ahead as quickly as possible, and by so doing we got some thirty yards nearer before they jumped. I got the old gander with the right and another with the left badly wounded, necessitating a shot from the cripple-stopper. How I gloated over those two geese, the first I had killed in China. I had often watched the spring and autumn flights until I got a pain in my neck, but had never had a chance to bag any of them. We waited in the long grass for the evening flight, but did not get any more geese, though the sky was full of them for about twenty minutes. They refused to alight for some reason. I had a shot after dark, but missed them, evidently.

Next morning, after a hasty breakfast by candle-light, we were off, and before we had gone a hundred yards a mallard was badly missed in the uncertain light. We

HAULOVER AT FOOT OF LAKE.

quarter of a mile away. A shot from the 12-bore brings him to bag, and we consider the events of the last twenty minutes highly auspicious, and visions of returning to Shanghai with the record bag of the season begin to float through our heads.

My sampan coolie turned out to be a regular idiot—one of those men who, when he is not blowing his nose, is coughing or carelessly striking the sampan with his pole or paddle.

The results were the same; ducks there were in plenty, but jumping out of the grass at impossible distances. J.'s gun could be heard occasionally, but so far I had not fired a shot, and was beginning to get desperate, when an old mallard delayed his departure a second or two too long, and came down to a long shot from the 12-bore. My murderous feeling passed off, and no doubt the coolie is living yet, and other men have experienced the same thirst for his blood that I had. The mallard, a blue-wing teal, and a coot or water-hen made up my bag that first afternoon, in the getting of which there was a good deal of luck under the circumstances. At dark we started back to the house-boat, expecting to find her where we left her, but she had gone to anchor at the other end of the lake, so we had a long hunt for it, which landed us, cold and hungry as well as disgusted, on board the boat long after dinner time. Seeing three fine geese hanging up, with half a dozen mallard and teal, to say nothing of a smoking hot dinner, and a cup of coffee such as only

HOUSEBOAT ON THE LAKE.

J.'s boy knows how to make, put me in better humor. Arrangements were made for another coolie to be on hand at daybreak, as I vowed I would not go with "the idiot" any more.

After cleaning the guns and arranging to be called at dawn, I turned into my sleeping bag, but lay awake a long time listening to the noise made by the myriads of mallard, widgeon, teal, geese, etc., feeding. It sounded like a waterfall at some distance or a heavy train going across a bridge. At first I could hardly believe it, until the sampan man assured me of the fact.

Next morning early the sampan came alongside, and in a few minutes we were ready for breakfast, as it was still much too dark to shoot. Even when we did push off, it was too dark to shoot with any certainty, so we pushed into a bunch of grass to wait for more daylight. While waiting, we could hear the ducks and geese in great numbers all about us getting ready for the morn-

STARTING OUT AFTER DUCKS.

pushed slowly for the place where I had got the geese on the previous evening, and on the way got a teal that was fighting high up. I sent two and a half ounces of No. 4 shot after him from the 8-bore. When the sampan man picked it up he said: "Dis kind small duck no d—good; more better shoot geese inside plenty have got." So what could I say but "All right; can go inside chop-chop." We found about twenty geese, and stalked them as well as we could. When they jumped at about a hundred yards, I stopped two, and watched two more pitch at some distance. One of these we got, but could not find the other. After some time the coolie said, "I think China boat have catchee," and we proceeded to chase the boat which was at least a quarter of a mile off. Of course the people denied all knowledge of the goose; so I jumped in and searched the boat, without success. At last a drop of water on the floor of the boat caught my eye, and as a result I found the goose wrapped up in a lot of clothing and stuffed in between a lot of baskets filled with paddy. None of the people seemed a bit abashed, but the old women got cross when a lot of onlookers laughed at them, and they went for me with a bamboo pail and a rake. There was no harm done, however, and we had scored, so we paddled away laughing. More mallards were picked up through the day, and in the evening we got several more geese.

The next day I could not shoot. I felt fit enough, but simply could not hit anything. Duck after duck jumped and got away untouched, even after firing both barrels at them. I had heard of people having their "off days," but it had never come to my turn before. There was no doubt about its having come that day, and as time went on I was afraid it had come to stay. I tried every way of shooting that I had ever heard of, but it was all the same, so gave it up in disgust, and went back to the houseboat with two mallards for nearly thirty shells.

In the afternoon the luck was a little more in my favor, and several more ducks and four geese were added to the bag. Photos were taken of the boat and the bag, which totaled one hundred and nine head of mallards, teal, widgeon, and geese.

Next morning we bid good-by to the lakes and returned to Ningp'o, where we took steamer again for Shanghai and work, feeling much better for the outing. The guns used by us were all built for us by Greener.

SAMPAN AND COOLIE, NINGP'O LAKE.

lockers, we of course used as our sleeping apartments; then comes a small pantry, and behind that a small place for cooking. The crew lived further aft, where they could cook their "chow" without interfering with us in any way. While waiting, kit bags were opened and comfortable old shooting clothes were put on, guns put together and put in the racks prepared for them, and in these various duties the wait of two hours passed quickly enough.

The Haulover is a double inclined plane, built of stone, up one side of which the boats are hauled by windlasses, one on either side. Soft mud is spread under the boat to lessen the friction, and as soon as the huge bamboo ropes are made fast the men heave on the windlasses, bringing the boats up inch by inch, at the same time passing very derogatory remarks about the boat for being so heavy, and they couple with the boat the builder and the builder's ancestors for many generations.

Once over the crown of the Haulover, the boat coasts down by its own weight, until a swish into the water of the canal, and two of the crew run out with a long, thin towing line, and we travel at the rate of rather more than three miles an hour, through flat uninteresting country, dotted with graves or unburied coffins, and cut up by innumerable canals of different sizes.

The canal is spanned by numerous stone bridges, usually bearing high sounding names, such as the "Bridge of Everlasting Peace" or "Lotus Flower Bridge," and every half mile or so we came to villages, with the people going about their work quietly, as if there were no such things as Boxers or Allied troops in existence, much less within a few hundred miles.

After about three hours' towing, we arrived at the Upper Haulover, where the same cursing and grumbling are gone through by the coolies at the windlass. Probably they always do it, and have done it for centuries. In a few minutes we are in the waters of the lake, and after another half hour of sculling we were fairly in "Duck-ville." Imagine a lake of one and three quarter miles by three-quarters of a mile, roughly, surrounded by hills running up to twelve hundred feet in places, with numerous deep bays running between the hills, for the greater part covered with grasses of different kinds, from the small floating duckweed to tall reeds of eight to ten feet

We used 12-bores for the ducks and double 8-bores for the geese. We both shot Schultze powder, and we prefer it to all others we have ever used. Nos. 4 and 5 shot did all we wanted it to do at the ducks, but in the 8-bores we used No. 1, and found it too light for the long distances at which we killed the geese, from 90 to 120 yards. Another time seven drams of Schultze and three ounces of BB would be far preferable. As my gun weighs fifteen pounds, it would take this load with ease.

On arriving at Shanghai, another pleasure connected with a trip like this was in store for us; I mean the pleasure given by sending presents of game to friends. This pleasure we had to the full, and it was a fitting wind-up to the most successful as well as the pleasantest shooting trip I think I ever took part in.

Floating Down the Mississippi.

A Cyclone

ON November 16, Carlos, the Spanish-American, and I were at Forked Deer Island waiting for the waves that drove up the chute to cease running so high.

There was a bluish haze in the air; no soft mountain mist, nor moist fog, but a hard-looking opaque thing that shut out the distance. Overhead the clouds came as scattered vapors and tangled mares' tails which slowly veiled the sun. It was warm, but a kind of feel was in the air as if it would be a pleasure to shiver. The wildfowl were uneasy, flying fast and low, or yelping on the sandbars. One great flock of mud-hens was feeding opposite Gold Dust Landing, from which I shot one bird. I saw a cabin boat tied at the landing which looked familiar. Later I heard some interesting details of what happened to this boat an hour later.

According to my map, a bayou was at the foot of the crossing, but when a gentle sprinkling drove us to land, only a little bay was formed there, the bayou being several feet above the level of the water. In the bayou, on beams, were cabin boats, and in the bay were several others. We ran into the west bank above the uppermost and tied to the stakes driven in the mud. I was a couple rods above an unkempt craft, built of rough boards and full of rat holes, cracks and a shabby roof. Carlos was above me.

I went down to visit the cabin boats on skids, and found that their occupants were engaged in cotton or lumber work, while on the bank some men were putting a new bottom under a store boat. I found the way tedious and muddy, so turned back as the rain began to increase rapidly. I found shelter under the tent Carlos had raised over his catamaran. But I remained with him for only a few moments, as the downpour increased in volume beyond anything I had ever heard before. I went into it, however, in order to bail my boat. The boat was only half covered with my canvas. The skiff was quarter full when I reached it, and I bailed a dozen gallons out in a minute. Then a gust of wind came dancing up the stream and whipped down over the top of the cabin boat, and the air grew white.

I had heard the expression "It rained so hard it was white," many times since coming to the river, but till then I did not understand it. The first fall fairly beat me to my knees. I recovered and bailed for a moment, but waves came under the cabin boat and began to lap over the side of the skiff, so I started out from the bank to run up the bay and get end on to the gale if possible. But I started too late. The cabin boat tore loose, breaking an inch-and-a-half rope, and swung round against me. I succeeded in working the skiff toward the bank as the cabin boat swung, and when my skiff ran into the mud I jumped for the chain, seized it, and went over the bow in a leap for the bank. The wind caught me in the face, and instead of landing on top the foot-high mud step, I landed in the quivering, wave-washed mud sloping under the water. The first plunge was to my knees, and my struggle to climb out only resulted in my going down deeper and deeper, until I was up to my waist. The cabin boat meantime swung against my skiff, and the skiff went under, with all my stuff in it. Then the cabin boat had only to come a little further to be against the hands I pushed against it to prevent being borne under in that awful slime.

I yelled, of course, and in a voice that neither winds nor waves nor pound of sheeted rain stifled. At the first yell there was a commotion under the A-tent of the catamaran, and the bulge of a back showed going stiffly along toward the bow. Soon the frowsy head and wide, round eyes of Senor came from under. "Yes, yes!" he called out, and jumping to the bank, seized his own boat's line, and by stout pulling eased the strain of the cabin boat from my arms. A moment later a man with whiskers and hair of a tawny color appeared hanging fast to his cabin boat's line. Their two strains swung their craft clear of mine, and from me.

The rain came down on the three of us in white shrouds—an ashy white—as we stood there. The heels of Carlos sank in the mud as he leaned back, the water pouring out of his long gray hair as if from lichens or moss, and the cabin boat man set his muscles, first to the lines and then his shoulders to the cabin boat to keep it from whelming over me. He was a big, bony man, and the sight of his muscles rounding up in humps under his stained shirt was welcome to my eyes.

The wind blew in from all directions, it seemed to me, and I think it was so, for I saw the water rise in foot-high peaks and the tops jump up in spouting fountains, while my mackintosh flapped straight up in the air and whipped about for seconds at a time. The very mud in which I was three-fourths submerged oozed up around and rolled me further into it. My elbows, almost at right angles to my backbone, were on the surface of the mud. Then the twisting winds gave a final kick down over the top of the cabin boat, sent a ripping gust of rain against us, and then the white grew gray slowly. I got a purchase on the sunken bow of my boat, and slowly wormed my way up and out of the mud.

The rain still came down in torrents, and as I bailed my boat the thick ooze with which I was covered was washed from me, and later on the only particle of the stuff I could find on my clothes was a thin, flat slab in the bottom of each shoe.

As the sides of my boat rose above the water, I could see the mess my things were in. As always, everything had been tied to the boat, so nothing was missing. I lifted up my typewriter, the water poured from the box. My camera was soused, and my trunk was completely full—maps, papers, clothing, were all saturated, including many negatives. My note-book, though wrapped in oiled muslin, and tightly tied, seemed so hopeless a mess that I didn't undo the covering, merely handing it to Carlos to put on the catamaran till another time.

The cabin boatman, Robertson, told me to come aboard his boat for the night, and I did so with my canvas hammock in which were the quilt and blanket. They had been clear under water, and I supposed saturated. On opening the hammock bag, however, there was only a space the size of my hand that was wet. I was so wet that I crinkled all over, but Robertson built a hot fire, which dried my clothes and warmed the boat.

The weather had changed. The blue haze was all gone. The storm passed swiftly by, and in two hours the rain ceased. Night found the stars shining, and a cold wind blowing from the north. The dry bed clothes were most cheering, and I slept my full night wrapped in them, curled up in a big old-fashioned rocking chair. In the morning, on unwrapping the note-book, I found only one sheet of thin insert paper stained by the water and running ink, but the letters were not illegible. Most of my foodstuffs were spoiled—peas, beans, flour, cornmeal, sugar, etc., either bursting their cloth sacks or dissolving. But thanks to the stout cords that tied things to the boat, I lost nothing of great consequence, though my camera needed the tinkering it got at Memphis from a jeweler.

At Gold Dust Landing, the familiar-appearing cabin boat was torn loose, swung around against the bank and saved from swamping only by the lively work of the crew, consisting of three men, two of whom I met up the river, and was to meet again, weeks later. I heard that other cabin boats were sunk in this same storm, but saw none of them.

The Government was putting in some matting just below Rosa, with the intention of preventing a cut-off at that point. A cut-off would make the river some straighter, but would wear away a few square miles of plantations, hence the solicitude. A great gang of men was at work tying wire rope around willow saplings, forming a rectangle hundreds of feet long and a quarter as wide. Finally, when the thing was wide enough and long enough, the whole business would be loaded with rip-rap rock and sunk against the wearing bank—if the crew had good luck. Sometimes the mats begin to weave, then the upper end ducks under and rolls up like a carpet, more or less, whereupon they do the work all over again. Robertson went down past the mat one day in his skiff. As he cleared the lower end, he was caught in the swirl, his boat was sucked under, and he himself slogged about. He had the struggle of his life, while the workers looked on, unable to do anything for him, till finally he reached the end of a rope thrown from the top of a caving bank. He warned us of the danger at the mat when we pulled out in the morning, and stood watching our boats as we cut across the current to clear the sucks at the mat.

This was one of the hardest days that I experienced on the trip. I was lame with the strain undergone the day before, and the day was a cold one—a white, sunshiny day, the river being swept by a gale of north wind which penetrated the clothes, chapped the hands and dulled the brain. We tried to find a place where I could spread out my clothes to dry, and with this in view ran down close to Plum Point, perhaps the most noted strictly river feature passed on the journey. John A. Murrel's gang had its hiding place at this locality, and countless produce boats were here attacked and captured previous to the breaking up of the gang, which numbered over 2,000, and covered a dozen States.

Plum Point sands contain unnumbered wrecks, and the Government has put piles there to hold the channel, an ugly looking point it is now, and we found no landing there. We tried to make a bayou opposite the head of Yankee Bar, only to be carried past by a sawing current of ferocious swiftness. Then, as the twilight of night came on, we hastened on down the long bend at the end of which is all that is left of Fort Pillow. Countless ducks were headed toward Yankee Bar and occasional flocks of geese lettered the sky. The spray from the yellow waves froze where it struck.

The map said that Cold Creek came into the river at Fort Pillow, but Cold Creek proved to be only a paper-thin stream trickling over the black ooze that was formed when Fort Pillow bluff caved off a few years ago. Formerly the water there was 200 feet deep, and it was into this eddy the defenders of the fort sprang from the brink when they could resist no longer. A fisherman, Pete McKay, had his cabin boat there on the mud, and he told us that veterans still lived in the neighborhood who participated in the battle, and being from both sides, still were fighting the war in occasional rough-and-tumbles that hurt no one, and eased pent-in feelings considerably.

There was no pocket to run into, and we had to haul our boats a few feet out of the water at the bows, put up our canvas, and make ready for the night; it was dark already. Then we heated some supper on McKey's stove, he telling us what we might expect for a few miles down the river. He looked prosperous, and so he was. He gave me some old fish bills showing that he sent four or five dollars worth of fish to market on four days a week, and this was the off-season. He made over a thousand dollars a year. The greatest catch he ever heard of was made when the Chickasaw Bluffs caved in and made the bar we were camped on. The water rose in a wave sixty feet high, and swept across the river, over the bank on the far side, and for miles back from the river flooded everything. When the water subsided, hundreds of wagonloads of fish were forked out of the mud puddles by natives thereabouts.

Carlos and I were too tired to listen for long, and we went to our boats to sleep. But we didn't very much. The wind was out of the north, and came quartering against our boats. The wavelets splashed against the sides and the spray flew up on the canvas, where it froze and creaked as the boats rocked. I crawled down into my hammock, rolled quilt and blanket around me, and tried to sleep. But the waves came three or four little

lapping ones, followed by a souser that shook the sleep from our eyes. The catamaran was worked around, and our boats rubbed and bumped at intervals all night, the mud being too deep to get out on to make a shift. Sometimes sleep came—hammered in, and it was thumped out again. Tiny threads of clammy chill wriggled down among the warm folds of my bedding, and percolated through the system of the encased victim, hitting the back of the neck, glancing around under one arm, and down across the stomach in narrow spirals of goose pimples, and the next streak would dart up the leg, on a through line to the chattering teeth.

Of the three uncomfortable nights I remember, this was the worst. One night in the Adirondacks I laid, coverless, wet to the skin, under a lean-to bark camp, while the fire sizzled in a storm of snow and sleet; another night I slept on a frozen sandbar of the Holston; but they did not compare to the one I passed at Fort Pillow.

All the day that followed the old man would frequently speak of his native land, and his eyes looked far away when he thought of Utali, the woman who found him lost in the forests of the Amazon, and prepared herbs to mend his spirits, and snails, lizards, grubs, monkeys, rats, and spiders to appease his appetite. "She danced about," he said, "her face beaming with womanly tenderness, her eyes flashing messages no educated man (sic) can misunderstand. Painted as a devil, she looked a saint, for no matter how savage the creature, no matter how barbarous the customs, the sacred fire which burns in the true woman's heart is just as sublime in the squaw as in the queen. It took me a year and a half to learn their language sufficiently to persuade them to take me to civilization, and then they did only on my promise to return."

Carlos was not speechless when he found that instead of mutton, the butcher at Luxora had given him pickled pigs feet, when it came noon, and I doubt not that he regretted returning to the sort of civilization we were enduring, when a Utali was doubtless waiting for his return on the banks of the sunny Amazon.

Although this was a stretch of river exceedingly interesting to historians, a better view of it is had through the written accounts that are found far from these regions. The river has changed its course so frequently that in many instances the present lay of the land would be actually misleading to an investigator; as in front of Vicksburg, for instance. But this is not to say the historian could write a better account for not having seen the canebrakes, cypress and gum bottoms, and murky sloughs through which the explorers and armies forced their ways. He would not see the precise things his subjects encountered, but the conditions are there. I preferred to enter trappers' huts and fishermen's shacks to viewing national cemeteries.

When we pulled out of Beef Island Chute on November 20, the smoke of Memphis sawmills was to be seen, and it was not long afterward that we descried the "red bank" marking the head of Ash Slough that leads down to Memphis, and promises some day to become the main channel of the river when the "red bank" is worn back a little further. Memphis hopes this will happen. There is a sandbar across the upper part of Memphis' water front. The eddy there flows up stream, but the sand and mud of the bar is a wave that flows against the current, threatening to make Memphis an inland town, and destroy the cotton and lumber industries.

Ash Slough proved to be a deep, narrow cut, down which a fast current sped to Wolf River, thereby saving us many miles around the Mound City Bend just above town. We came to the Ash Slough shantyboat town, and at the little blue cabin boat stopped to get our bearings. As we came alongside, a woman came out to look over her spectacles at the catamaran. "Land sakes!" she exclaimed, "What do you call that?"

It warmed the ice away, and Carlos, always good at explaining, began. As he tied in he talked of "leverage," increased floor surface in proportion to displacement, and advantage of the broad beam. Soon, however, the inevitable soup pail was produced, and then the "lady of the house" allowed us to come in and cook.

The woman was Mrs. Lottie Haney, who lived there with her son Jesse, the night watchman on the Government dredge that keeps Wolf River open to the log tow-boats owned by sawmills up the stream. I was looking for a place to stop for a while, and Carlos was so short of money that he needed work. I struck a bargain with Mrs. Haney for food at ten cents a meal, while Carlos asked about furniture shops. A part of his cargo on the catamaran consisted of folding chairs of his own invention, and he was going to try and find a manufacturer to make them.

It was Saturday, November 21, when Carlos went looking for work and I for my mail. We dropped down Ash Slough to the sawdust pile across Wolf River, and went up this to the main street. Carlos wore a broad-brimmed hat, a vivid pink shirt, and clothes that had been made for a man of much larger waist measurement. He went hunting a barber who would cut his hair for fifteen cents—and found him, as he told me later on; but of his adventures that day he said nothing. I saw him return toward night. The bit of jauntiness that marked his bearing in the morning was gone, and it was plain to be seen that he was dead tired.

Sam Cole, Mrs. Haney's son-in-law, was building a 64-foot store boat in the slough, and wanted help. He got Carlos that night, and agreed to pay him \$1.25 a day—half a carpenter's wages—and board. Carlos thought the board was to be free, but Cole charged him \$3.50 a week when it came to settling.

It was at Mrs. Haney's that I first became really acquainted with river people of the cabin boats. There are not so many cabin boats as there used to be, and the number is growing less year by year, it is said. But I have no doubt that the time will come when people will go down the river in cabin boats for the sake of the fun and weather they find in the lower reaches. This was done a few years back by people who had nothing else to do, nor other place to live. Certain it is that anyone looking for a novel experience, a pleasant time and travel, will do much worse than to go on the river at St. Louis or Cairo in a staunch cabin boat and drift to New Orleans.

RAYMOND S. SPEARS.

NATURAL HISTORY

The Moundville Mound.

THE great mound at Moundville, W. Va., belongs on our list of sportsmen's finds, since it was discovered by a hunter while out deer hunting. It was at least as a sportsman's find that we came to know anything of it, and it is as a sportsman's find that it now comes to the attention of him who may read the facts and speculations hereinunder set out.

The Pittsburg Despatch recalls the story and describes the great monument of past races:

In the year 1770 Joseph Tomlinson pushed his way through the wilderness until he came to the Ohio River, and, finding a valley four miles long and two miles wide at one place, he laid a land warrant on all the northern portion of the valley and built a cabin at a spring 400 yards north of the mound. But it was not until two years later that he discovered that so near his home, hidden in the tall, dense forest of the rich valley, was the largest mound in America.

One day in the year 1772 Mr. Tomlinson took down his flintlock rifle and started southward through the woods to replenish his larder with venison. Good luck attended him, for soon he killed a deer, and by that act found the mound. As was the custom in those days, he disemboweled the deer, skinned the legs, tied the skin from the legs together and shouldered the game. On the homeward journey he came to what he supposed was a steep hill and climbed it. Then he saw the smoke from his cabin chimney and realized that he was standing on the apex of a cone of earth which his path a few yards to the right or left would have avoided. He immediately laid a land warrant upon 200 acres more of the valley to include the mound.

Originally the mound was 90 feet high and 240 feet in diameter at the base. It is composed of many varieties of earth, apparently carried there in baskets or small conveyances. Seventeen varieties of forest trees grow upon it. Some of the trees are quite large, one being nineteen feet in circumference.

After the valley became thickly populated a shaft was sunk down from the top of the mound to the bottom and a tunnel dug out to the northern side, the

of five cents from each pupil in the State. Marshall county children contributed about \$400 on the day appointed by the State superintendent of schools for contributions to be made, but not a penny was given outside that county. Now that small nest egg seems to be lost somewhere about the State capital.

When Mr. Carnegie began establishing libraries the city of Moundville put underway plans to buy the spot and erect a library building there, provided Mr. Carnegie would donate the usual library. The great philanthropist returned to Scotland before he could be approached by the city's committee, and thus another movement failed. A plan for State control has been brought to the front when the Legislature has been in session, but not enough statesmen could be enlisted in its support.

Four hundred feet east of the mound the West Virginia penitentiary is located. The recent plan for State control designed a water reservoir to be located on top of the mound, to give a water supply and fire protection to the big State institution, where more than 900 State and United States convicts are confined. The top of the mound is higher than the prison buildings. Convict labor could be utilized very advantageously in beautifying and caring for the mound and the square surrounding it.

Unless something is done before next summer, Mr. McFadden will have the timber removed, make use of the 85,000 brick used in the tunnel, and dispose of the earth to whoever may want it for making fills in lots, streets or along railroads.

In response to an inquiry about the present conditions of the mound and the plans for its preservation, Mr. McFadden, who is now in his eightieth year and "enjoying life with pretty good health," writes under date of Oct. 2, 1904:

MOUNDVILLE, W. Va., Oct. 2.—*Editor Forest and Stream:* I am pleased to learn that there is some one interested in the fate of the prehistoric mound from which our beautiful little city takes its name. The mound still stands as a monument to some prehistoric

Monarch, the Big Bear.

Editor Forest and Stream:

Mr. John Malone's letter, calling attention to the parallelism of Mr. Ernest Thompson Seton's latest book, "Monarch the Big Bear," and the stories in my obscure little volume of bear tales entitled "Bears I Have Met—and Others," calls for an explanation from me. It is true that I supplied to Mr. Seton substantially all the material for his story, and I appreciate at its full value the compliment he has paid me in using my unpretentious tales as the basis of an intimate animal study, and making of my detached sketches—some true and others avowedly mere camp-fire yarns—an historical novel of bear life. Nevertheless I feel that Mr. Malone's implied criticism of the manner in which Mr. Seton has bestowed that compliment is justified, and that I have reason for objecting to wholesale appropriation of my work without credit by another writer.

In a certain sense I did give my consent to the use of my material by Mr. Seton, but there seems to have been a difference in our understanding of the extent of that use. Mr. Seton explains in the foreword of his book that he has taken two liberties that he conceives to be proper. The propriety of other liberties he has taken depends, perhaps, upon the point of view. Some of them may be regarded as permissible literary license. For example, the "dedication," in which Mr. Seton describes Lan Kellyan, the man who secured Monarch and told him the story of the big bear's life, as "a rough man of the hills, ready to talk but knowing not how," and giving him the story in "a tongue unknown to script." It amuses if it does not flatter me to be pictured as a wild and woolly mountaineer, capable of seizing a bear by the ear and hauling him into camp, and as a teller of "rude tales." That is literary license, which I also may have taken now and then in the thousands of columns of matter I have written for newspapers and magazines in my "tongue unknown to script" during thirty years of labor with the pen.

About five years ago Mr. Seton brought to me at Los Angeles a letter of introduction from my friend Louis Ohnimus, the Lou Bonamy of his tale, no doubt. Mr. Ohnimus explained that Mr. Seton was anxious to learn something about the habits and traits of grizzlies; and that he and Mr. Seton had made an unsuccessful hunt for bear signs in the Sierras; and he asked me to assist Mr. Seton.

Mr. Seton said he had had no opportunity to observe the grizzly in a wild state, and wanted to study the animal in its native haunts. I offered to take Mr. Seton into the mountains and put him on the trail of a large bear, whose habits and haunts I knew well, and to devote two weeks to his service for the fun of the thing and for the sake of my friend Ohnimus. Mr. Seton desired much to accept my offer, but his time was limited, and we were obliged to abandon the plan, regretfully on both sides.

As the next best thing, Mr. Seton suggested that I tell him what I could about bears. In the parlor of the Van Nuys Hotel, Los Angeles, not at a camp-fire on Tallac, I told to Mr. Seton many bear stories, some of which I afterward put into my book. I told them substantially as they appear in my book, and I informed him that most of them had been published by me in newspapers, and that I intended to publish the rest. He said: "I will give credit for what I use." I replied: "You are welcome to any information about the habits and characteristics of bears you are able to extract from the stories. I am very glad to be of service to you." Possibly he interpreted that as a relinquishment of the right to credit for the stories themselves, but it seems to me that the publication of those stories in a copyrighted volume should have been sufficient to disabuse his mind of any such misapprehension.

I told to Mr. Seton the story of Jack and Jill almost literally as he tells it in the first two chapters of his book. I had written and published it in similar but briefer form in the San Francisco Examiner in 1888, under the title of "Morgan Clark's Bears." It was a story of two black bears captured and tamed by Morgan Clark, a hunter in Siskiyou, who had been my companion on hunting trips. Perhaps I failed to make it clear to Mr. Seton that Jack, the bear that followed Morgan Clark like a dog, watched his coat in the hay field, and had the adventure with a hornets' nest, which he pulled from a branch and drowned in the Shasta River, was a black bear and not a grizzly. However, it is asserted by many naturalists that although the adult grizzly cannot climb, a grizzly cub can and does climb trees while his claws are short and his weight small. Mr. Seton's tree-climbing grizzly is represented to have been a young cub. The original Jack was a well-grown black bear, but the substitution of a grizzly in the story is a permissible literary liberty.

Because nearly all the adventures and incidents of Monarch's life, as told by Mr. Seton, are contained in the stories in my book, it may not follow necessarily that Mr. Seton took his material directly from "Bears I Have Met." True, my book was published more than a year ago, and I sent a copy to Mr. Seton, who had kindly given me a pencil sketch of Monarch to use in the book, but I had told him many of the stories, and he had taken full notes, five years ago.

It might be argued that Mr. Seton did not refer to my book while writing his; otherwise he would have noticed that many of the incidents treated by him as "known truths" of natural history are frankly told by me as imaginary adventures of a mythical bear in the chapter of my book entitled "Chronicles of Clubfoot." In that case, it might be held that I am therefore responsible for an imposition of fanciful tales upon the public as veritable natural history. I may have failed to differentiate fact from fiction while I was spinning bear yarns in the Van

THE MOUNDVILLE MOUND.
From a photo in 1904.

apex leveled off and a three-story pagoda-shaped building erected for dancing, and a museum established at the bottom of the shaft. The enterprise did not pay, and since then the place has been totally neglected, except that it is the mecca of pilgrims from all sections of the country every day.

When the excavation was made three skeletons were found directly in the center, but raised a few feet from the level of the surrounding land. One of the skeletons had belonged to a male human being about eight feet in height, one a female and one a child. There was also in the rude chamber a tablet of stone, upon one side of which were hieroglyphics, which is now in the Smithsonian Institution at Washington, many heads of ivory and other articles.

The present owner, G. S. McFadden, has owned the city square, upon which it stands, for more than thirty years, and in that time has never derived one penny of financial benefit from it. He has lent enthusiastic support to various movements designed to transfer it to State control and have the property improved and eared for in a fitting manner to preserve it to future generations, but now, since nothing has been accomplished in thirty long years, he will transform the square into a building site.

One of the movements exploited for giving to the mound the attention it deserves was for the school children to acquire ownership of it by a contribution

race. Their name and the country from which they came are the mystery unsolved. I presume you have read of it, and I hope you may have had the pleasure of seeing it in its grandeur, when the large forest trees and shrubbery are in full leaf.

The location of the mound is almost in the geographical center of nearly 4,000 acres of a beautiful valley. The high now is 70 feet; it was originally 90 feet. At the base it is 245 feet in diameter, and is now 63 feet in diameter on top. The fate of the mound depends on the action of our Legislature this coming winter. The plot of ground in the mound property is 340 feet long and 242 feet wide, and is surrounded by four streets. The mound stands within 150 yards of the West Virginia penitentiary, and 300 yards from the County Court House. I have offered the mound and surrounding plot of ground to the State for \$30,000. I could sell the dirt, material of which the mound is composed, 55,000 cubic yards, at 10 cents per yard, purchaser to do his own hauling; there are 85,000 good bricks inside the mound, put there by a son of old Joseph Tomlinson, the discoverer of the mound. The forest trees are large, some of them three feet in diameter. The earth, timber, bricks and thirty-five building lots would bring me \$50,000. If the State takes me at my price of \$30,000, the State will be bound to preserve it for all time, unless destroyed by the elements.

G. M. S. McFADDEN.

Nuys Hotel. Assuming Mr. Seton to be a naturalist and a man of the woods, I may have taken it for granted that he would recognize the Clubfoot tales as humorous fiction without a label. I regret that my carelessness in the use of a "tongue unknown to script" should have placed Mr. Seton in a position to be criticised from the standpoint of scientific naturalists, and the wisdom questioned of his "return to his earlier methods."

As a matter of fact the story of Monarch was published as I first wrote it—a newspaper account of the bear's life, capture, captivity and despair—in the San Francisco Examiner in 1889, when I brought the bear from the mountains to the city and placed him under the care of Louis Ohninus, then superintendent of a zoological garden. A shorter and unembellished narrative of the capture, written by me, was printed in the Cosmopolitan Magazine in 1890. The original newspaper story was reprinted in full, and with due credit, by Joaquin Miller, in his book "True Bear Stories," in 1900. The plain, straight facts of the case were given in a chapter of my bear book, published in September, 1903.

I have told the story of Monarch, in script and in the "tongue unknown to script," so often that I am weary of it; but it is my story, and virtually all the incidents in Mr. Seton's book are my stories, and I do not feel that Mr. Seton's dedication to mythical mountaineers or his fantastic twist of my name fulfills his volunteered promise to "give credit" for what he took from me.

ALLEN KELLY.

Some Animals I Have Studied.

XIII.—Queer Behavior of Animals.

Hogs are considered "the beastliest of beasts;" perhaps rightly, too, if there were no hogs in the world but the stock-yards sort, that have been "bred up" and compelled to endure an unnatural life from the beginning. Such hogs are all that are known by the majority of mankind. I never admired the character of hogs until that remarkable pig mentioned in a preceding chapter led me to more minutely examine into the possibilities of pig character. About the same time, or but little after, I became interested in a pig belonging to a neighbor, Aaron Louder, who lived in the woods a mile south of my uncle's home. This pig, also orphaned, was allowed the run of a large pasture, with only a calf for a companion. They became inseparable. When the calf walked, the pig walked, very close at its side, too. When the calf reclined, the pig did so, too, snug up against its side. If the calf edged away, the pig persistently followed, pressing even closer than before. If the calf arose in disgust, the pig ran under its nose, tried to kiss it, and gave vent to a conciliatory "wah-wah-wah-wah," which sounds like a hearty gastronomic laugh, is always a sign of good will toward the individual addressed, and is very different from the panicky "woogh-woogh! woogh!" uttered whenever a supposed enemy approaches. I'm afraid the friendship was a little one-sided; the pig liked the calf, but the calf—well, a calf seldom likes anything but its feed. The fact is, I consider cattle less affectionate and less trustworthy than any other domestic animals. There is a great deal of sentimental nonsense in poetry about cattle; and in farm papers much of the talk about cows might cause a "city chap" to suppose cows to be nice, clean, well-behaved, almost holy beings, too good for ordinary human kind to touch. Now, I have had a little experience with cattle. I have chased them afoot and on horse; I have carried many a calf in my arms, through brush and briar, up hill and down, and across streams, when the thermometer stood at 90 to 100 degrees in the shade; two or three were week-olds, or older, and kicked like prize fighters; some I carried a quarter of a mile; one I carried and dragged two miles, at the same time defending myself from the infuriated dam (after first chasing the two, on foot, no less than five miles). I have caught unsubmitive cows by the horns and held them to be milked or belled or roped. I have stopped runaway oxen twice, once on a steep hill by leaping in front of them and catching a horn of each and twisting their necks until their heads came together. In the instance of the steep hill, I was carried some distance, though, for it was impossible for the team to soon stop the heavy load of cordwood that was violently pushing them, the brake having failed, and the driver left helplessly in the rear; while, to make the situation the more desperate, our own team of nervous, mettlesome horses were but a short distance ahead, not yet quite at the bottom of the incline, with my brother driving. I have been tossed high in the air by a bull, coming down head foremost into a rotten stump; and no man can be kinder or gentler with cattle than I am, when they are willing to receive kindness; yet I never knew a cow that could be managed with "love" alone, or that could be trusted in a garden, or in an orchard, or among young children, unless some powerful, watchful and masterful person stayed near. I do not presume to declare that no other man has known better disposed cattle. But I have seen tender babies crawling over old sows, playing gleefully with the astonished little pigs, and the sows, apparently flattered at the angelic visits, not only refrained from intentional harm, but were careful to avoid accidental injury—careful beyond the power of words to describe. One of these incidents I and others witnessed in a pen belonging to Mr. Caswell, blacksmith, in Hot Springs, on a very busy street. I have known at least one child to crawl into a stable and under the manger, cowering defiantly at the reputedly vicious horse, who stood over him trembling as with ague and not daring to move a hoof. Of course I am horrified to see innocent babes allowed to take such risks. But the fact remains that I have seen them apparently safe among all sorts of domestic animals except cattle. From what I know of these brutes, I'd consider any man a monster who would allow a crawling baby to stay five minutes alone with one or more cows. They are so clumsy and heedless that it would be a miracle if they didn't kill or mangle the little one in some manner. And they so hate a dog that the presence of one would only increase the baby's danger.

The Spiva family at Crystal Springs had a shoat which took such a liking for one of their old dogs that it followed him everywhere that a pig could go, undoubtedly preferring his comradeship to the society of its swinish

relatives. The dog was at first much embarrassed, and snubbed the would-be companion steadily for several days; but the shoat's unvarying admiration and honest friendliness soon won him, though his manner toward it was rather condescending.

But the best proof that a hog can be gentle and thoughtful, whether through respect or fear, is the fact that our birds, old, young, big and little, eat regularly with our hogs, which number from 15 to 40 or 50, according to time of year, without being injured in the least particular more than at the rate of one, or at most two, a year; although the hogs struggle with each other almost as severely as men at football, the scene being apparently one of the wildest confusion. And the escape of the poultry is not due to their own caution and alertness, be sure; for among the hogs they are entirely lacking in these otherwise saving qualities. No, but the hogs are amazingly careful, amid all their wild rushes at each other, to avoid stepping on or striking even the tiniest bit of a chick. The chickens behave exactly as if they considered the hogs their dearest and truest and most unselfish friends, and seem to think they are shelling off the corn purposely for them. Seldom does any hen or chick take a single step to get out of the way of even the most furious rush, unless a strange hog appears among them.

"Ah, but your chickens are probably a very tame, lazy, stupid set!" says some incredulous reader. Nay; on the contrary, they are very lively—away from the hogs—and rather wild. The fact is, we cannot keep them away from the swine without shutting them up, which is impracticable; though this summer and fall our Coalie tries to keep them back whenever asked to do so. In this, however, she is not a complete success, for some of the hens declare they'll "die first," and refuse to budge.

After the feast, the hogs lie down, and almost hold their breath while the hens, shocking to relate, walk over them, often stepping right on their eyes or between their open jaws, after the insects that are almost sure to be burrowing into the thick, yet surprisingly sensitive, skins of the big beasts.

There is one very, very old black sow which two or three years ago caught a hen that had been annoying her beyond endurance, and after shaking her as a terrier does a rat, let her go, minus about a third of the feathers. But the foolish hen soon returned and attempted again to steal an ear of corn from the sow's mouth. Several hogs were also after that same ear, causing the sow to grind up cob and all for fear of losing a grain of it, and seeing that she was almost "beside herself" with rage, we tried to scare the hen back by throwing at her. In vain! She went straight to her doom. In a twinkling the sow was running with her mangled body in her mighty jaws, and so far forgetful of her great-great-grandmother dignity as to squeal like an habitual chicken catcher.

"Coalie! Gipsy! Catch her! Make her give it us!" I shouted. The dogs, instantly comprehending, flew in pursuit, fully as angry as I was, and in half a minute they had the offender in a helpless sitting posture, squealing a very different tune, while the shapeless carcass lay in a heap under her nose. After that the dogs would not allow that sow to come near the feeding place at feeding time for so long that she finally gave up and stayed in the woods until I went after her and showed her that she was forgiven, and to be given another chance to be "respectable." Since then she has a horror of birds' at eating time, and will actually leave her corn and run away if any hen becomes too familiar. Farmers who have experienced the impossibility of breaking even a young hog of the chicken-eating habit, will agree that this is really a very remarkable sow.

She is odd in all her ways. If she gets into a cornfield, instead of having to drive her out by force—though I have done that, too—I can go to her and say: "Here, old sow! Come out of this," and she will follow me out. Isn't that indeed strange? Yet her greed for corn is not merely normal—it is phenomenal. I have known her to rear up above the other hogs, in her eagerness, and catch an ear of corn thrown from a distant place, and going with such velocity that it crashed against her teeth like one rock against another; and stand on her hind feet and chew it, cob and all, until she could hold the whole of it sufficiently within her cavernous mouth to prevent any other from seizing any portion of it.

The cat Lucy did a wonderful thing with her last kittens. We tried to compel her to rear them in the barn, but though we prepared her a cozy bed in a quiet place upstairs, and fed her there, and only there, she would not leave them there, perhaps fearing a snake or an owl would take them, and desiring to place them more nearly within the protection of ourselves, or the dogs. She first hid them in the cellar; then under the house; next time under a pile of old shingles at the cellar entrance; and after bringing them away thus a great many times, she at last climbed up a peach tree on the east side of the house and leaped on to the roof with them, one at a time, of course (there were three). We were all very busy, and exasperated with her obstinacy, so we let her go, and soon forgot her, as well as her family. Then there came a series of heavy showers, day after day, night after night. Some of them were floods. Of course we thought of the kittens then, and supposed they would all be drowned, for I know of no animal so easily injured by wetting as a cat; though I have read of a singular cat that plunges into water and catches fish for its master.

One day, after one of the hardest showers, I thought I would search for the dead kittens and get them down and bury them. I believed they were on the north porch roof, as that was the only place where they could be hidden. There is a riotous white honeysuckle there, which not only forms an impenetrable wall of richest green from the ground to the eaves, both summer and winter, where wrens roost at night in perfect security, but monopolizes most of the upper surface of the roof. With a ladder at the densest part, I ascended to the dripping verge, and poked around under the leaves with a cane. A faint "Mew!" startled me, and one of those kittens crept from the upper edge of the screening vines and walked slowly up toward the house. It was perfectly dry. I "meowed" to it, to call it back, and at once heard the other two softly responding right under my nose. Lifting up the vines slightly, I found the "nest," and dis-

covered the cause of their dryness, though I was no less astonished than before. The vernal screen was dense enough to form a good roof over them; but what had kept them from being wet by the floods rushing under them? Why, only a drift of dead leaves; a drift that had been years in forming, and was several inches deep. Query: Had Lucy accidentally chosen this bed of leaves under a sufficiently protecting canopy, or was it an instance of reasoning and judgment?

Coalie and Gipsy have lately been showing new and interesting evidences of human-like judgment, justice and mercy, some of which I will relate in the next chapter.

L. R. MORPHEW.

[TO BE CONTINUED.]

Those "Sleeping" Black Ducks.

Editor Forest and Stream:

Mr. L. F. Brown and Mr. A. H. Stephens declare that they have never seen two or more black ducks asleep at one time, and on the strength of their not having seen such a thing, swing at us the sweeping "universal negative," as President Roosevelt would call it, that "No man ever saw two or more dusky mallards that were all actually asleep together."

Putting aside the technical error of such a statement, as well as some others in Mr. L. F. Brown's attack on Mr. John Burroughs, I must make the concrete and specific statement that both gentlemen are entirely in the wrong, and that I have more than once seen two black ducks "sound asleep," and several times four. But never one, three, five, six or more. Always a pair, and rarely two pair. But under peculiar conditions—just exactly the conditions under which Mr. Burroughs describes: on the drifting ice floes in the Hudson in March. In March the black ducks arrive in the Hudson from the south, and, alighting on the drifting ice far from shore, sleep, mate, rest, and eat whatever drift they can find among the ice. With our boats covered with muslin to imitate the ice, we then go after them. As a rule, I agree with Mr. Burroughs that the sleeping pairs are harder to approach than those which are awake. Whether this is due to "telepathy" or not I cannot say, nor does Mr. Burroughs in his very interesting article in the August Outing.

Now, I hear Mr. Brown asking, "How does he know they are sleeping?" Well, it is very simple. I remember three instances in particular where I have paddled to within thirty yards of a pair of sleeping black ducks, risen up above my battery, taken deliberate aim—the ducks sleeping on—and killed them both as they slept. Under the conditions that we get our ducks, that was not unsportsmanlike, either. Another time I rose above the battery and as the ducks still slept—or rather stood on one leg with their heads under their wings—I spoke to them. Still they slept, the snow that was falling muffling the air. Then I shouted. Two more startled ducks you cannot imagine. By the way they acted I am certain they had been "sound asleep," Mr. Brown to the contrary notwithstanding. As they rose, I killed one and missed the other. Now there are exceptions. And it is exceptions on which the "school of the woods" and the "new school of nature study" base their claims for a hearing. When a calm, sane, unprejudiced observer like Mr. Burroughs, says he has seen something which they have not seen, these same men are the first ones to fly at us with their universal negatives. If we apply the same rule to Mr. William J. Long's writings, we would at once—well, we had better not print what any real nature observer would have to say about Mr. Long's fairy tales.

Now, if Mr. Brown or anyone else whosoever does not believe that a pair of black ducks will both sleep at the same time, let them come up here next March and I will convince them that they are wrong until they "acknowledge the corn," and go away wiser than they came. We can make one universal negative, however—"No man knows it all."

JAMES ACKERT, JR.

Dogs and Languages.

EVER since the dog became the servant of man he has also had to be a linguist. If the annals of dogs and men were searched, it would be found that the former had in their day been proficient in the understanding of tongues dead for centuries, as they will be in the future of the languages of nations yet unborn. "Argo" doubtless obeyed the orders given by Penelope in the most lady-like Ionic of the day; the dog of Alcibiades was no less proficient when addressed in "up-to-date" Attic by the club porter in Athens; and we may be very certain that all the dogs on the canvases of Cuyp and Teniers were equally familiar with the dog language of double Dutch.

"Don't say that before 'Snap.' 'Snap' don't know he's only a dog. He thinks he's folks!" was an American appreciation of the quick wit with which dogs understand and resent anything a man said about themselves. The degree to which they comprehend doubtless differs, and is probably in most cases limited to the perception that their name is associated with laughter or a censorious tone of voice when mentioned to others. Also the range of conversation, and of activities to which it refers, is so large in the average gentleman's house that a dog often gives up the effort at understanding more than actually concerns its daily comfort. It becomes bored by the demands on its attention, the more so as it has as a rule nothing to do to keep it busy. But any one who has spent any time, let us say, in fishing quarters in a northern farmer's house cannot fail to notice how simple and few the items are which make up the routine of the day, and how completely the dog—there is always a dog, and that a collie—understands all that is going on, and probably most of what is said. These farmers are very silent people as a rule, speaking seldom, and then only about practical matters. When happy and comfortable, their practice is to sit quiet, not to talk. So the dog takes very special notice when a remark is made, knowing that it is usually connected with the doing of something by other people or by itself. It is quite used to be told to "mind the baby" or to "stay ben the house" while the wife goes out, and it knows exactly and to the minute that every person and every animal about the little farm will be doing at any given time. It is thus that it also learns

to understand talk which refers to these objects of interest.

St. John in his "Wild Sports of the Highlands" says: "The dog that lives with his master constantly, sleeping before his fire instead of in the kennel, and seeing and hearing all that passes, learns, if at all quick-witted, to understand not only the meaning of what he sees going on, but also frequently, in the most wonderful manner, of what is being talked of." He then mentions the instance of his retriever, which understood all that was going on as to the sporting plans of the day. If he remarked at breakfast: "Rover must stop at home to-day; I cannot take him out," he never attempted to follow him; while if he said: "I shall take Rover with me to-day," he was all excitement. But the most curious example of a (probably) polyglot dog's understanding of conversation was shown him by a shepherd. Like the dogs of modern Greece, which keep watch along the little banks which inclose their masters' barley fields, the sheep dogs "watch their masters' small crop of oats with great fidelity and keenness, keeping off all intruders in the shape of cattle, sheep and horses. A shepherd once, to prove the value of his dog, which was lying before the fire in the house where we were talking, said to me in the middle of a sentence concerning something else, 'I'm thinking, sir, the cow is in the potatoes.' The dog, which appeared to be sleep, immediately jumped up, and leaping through the open window, scrambled up the turf roof of the house, where he could see the potato field. He then, not seeing the cow, ran and looked into the byre, where she was, and finding that all was right, came back to the house." The shepherd said the same thing again, when the dog once more made its patrol. But on the doubt being uttered a third time, it got up, looked at its master, and when he laughed, growled and curled up again by the fire.

It is greatly to the credit of canine intelligence that dogs seem able to understand not only orders given in any pure language, but also those given in debased or mixed languages. Is this, perhaps, the origin of the phrase "dog Latin?" The dog teams used when the Klondike was first discovered were worked in a kind of "pidgin French," a mixture of old Canadian-French, English and Indian. The order to start was "Macharn!" which all the trained dogs understood. This the English miners turned into "March on!" Its origin, and the form in which the first sledge dogs had heard it, was "Marche, chien!" Probably most English hounds were addressed in a bastard Norman-French long after the language was entirely dropped in speaking to persons. It is just possible that the familiar "War hare!" and "Eloo in!" are the remains of the ancient foreign hunting terms.—London Spectator.

A Tornado's Path.

Editor Forest and Stream:

I was riding south in the Choctaw Nation, Indian Territory, about twenty miles below the Arkansas River, and not far from the line of the State of Arkansas, when I came to a place where a tornado had passed only a year before this in 1881. The road I was following passed through heavy timber for miles, and the tornado, coming from the west, had crossed the road, keeping on straight east. The trees in its course all lay with their heads pointing east, and lay almost as straight as if they had been felled with an ax. The open space that had been left by the fallen trees was not more than forty feet wide. It looked exactly as if it had been cleared off for a railroad, except that the trees were still lying where they had fallen. Some of these trees were all of two feet through at the butt, and those that had not been uprooted were broken off in most cases only a foot or two above the ground.

Just to the left of the road I was on, standing in among the timber that still stood, and not over ten feet from the place where the tornado had passed, was an old log cabin that looked as if it had not been occupied for years, but not a shingle on the roof seemed to be missing; the wind had not touched it. I wanted very much to see where the tornado had begun or where it ended, but it would be almost impossible to follow its track on foot, much less on a horse.

I was afterward told that the tornado had cut straight across this strip of timber twenty miles or more, beginning in it when it first met the timber and leaving at its eastern end, then keeping on through the State of Arkansas. It followed through a country where there were not many settlers, so about the only damage done was to the timber.

CABIA BLANCO.

Bears on an Iceberg.

SEATTLE, Oct. 17.—Lars Hansen, a member of the crew of the whaling schooner Barbara Hernster which arrived in Seattle harbor recently from the Arctic Ocean, tells of a strange sight he saw while returning to the vessel from a lively chase after a big whale. The small boat, with three men in it, was passing the face of a monster iceberg when three polar bears were seen. All of them were frozen in solid ice, two cubs nestling against their mother. Hansen says that the berg stood out of the water fully 10 feet, and that the ice wherein the bears were entombed, was clear as crystal. How long the animals had been locked in their winter palace is a matter of conjecture. They were, at least, twenty-five feet above the water.

PORTUS BAXTER.

Partridge Drumming in the Fall.

OSSINING, N. Y., Oct. 27.—Editor Forest and Stream: Replying to L. F. Brown's inquiry regarding the drumming of partridges in the autumn months, would say that in Alaska, between the 5th and the 15th of October, after the thermometer had registered 15 degrees below zero, I have heard grouse drum. There was no illusion, as I have shot birds at this time of the year by following up the sound, and in each case found the drummer standing upon a log.

In the Province of Quebec, north of Lake Quinze, I have heard ruffed grouse drum after the middle of October. Previous to this there had been frequent snowstorms and ice had formed along the edges of the rivers.

On some days one may not hear the sound of drumming at all, on others it will continue throughout the day and late into the night. This is said to foretell a cold snap. Before a storm, ruffed grouse may be heard feeding in the bushes on dark nights, thereby enabling them to keep under shelter until after the storm. John Polson, a well-known half-breed guide of North Temiscamingue, Quebec, states that in drumming the bird beats its wings together in front of its body. I have no doubt that a letter to Polson at the address given above would be promptly answered, and if John is in a communicative mood the information therein contained would be very complete and reliable.

EDWARD F. BALL.

TORONTO, Oct. 31.—Editor Forest and Stream: Referring to the inquiry in last week's issue of your paper made by L. F. Brown as to whether partridges drum in the autumn months, I have hunted these splendid birds in practically all parts of northern Ontario, where they are probably as plentiful as anywhere in America, and can say positively that they do drum in the autumn; but whether it is the old or young bird I do not know.

THOMAS A. DUFF.

A Pigeon Leader of Ducks.

ST. PAUL, Minn., Oct. 26.—One of the strangest sights ever seen by sportsmen was witnessed last Saturday on the duck pass owned by Uri Lamprey, of St. Paul. Mr. Lamprey and a friend had been shooting for some time, when they observed a flock of ducks coming along from the north. The ducks were teal—blue-wing teal—and at their head was a white bird. "That's queer," said Mr. Lamprey. "I'll take the white bird and see what it is." Both sportsmen fired, both bringing down their bird. Upon examination it was found that the leader of the ducks was a tame white pigeon. If anyone has ever before seen a flock of ducks led by a pigeon, it is time to rise and say so.

L. E. CAVALIER.

GAME BAG AND GUN

Birds that Pass in the Night.

If our vision would permit us to see far into the air above us on favorable nights during the spring and fall migrations of our birds, we would be amazed at the number and variety of our feathered friends at times at an altitude of a mile or more above the earth, which are taking their long journey to their winter homes in the South, some flying as far as Central America, Cuba, and South America, and others spending the winter in our Southern States. Returning in the spring and early summer, some remain with us in New England, while others go on to the far north to rear their young in Canada, Labrador, and in the case of the brant and some other species, to the Arctic Circle in places unknown to civilized man.

The timid or weak-winged birds, it is thought, migrate by night, seeking food and rest by day, while the bold, strong-winged birds like the swallows, hawks and eagles, migrate mostly by day.

One of the most interesting of our birds, and which for the most part passes by night, is our prince of game birds, the woodcock, whose ancestors were pure native Americans, and claimed a residence here long before the white man came from over the sea. So exclusive are they that, except to the sportsman, they are very little known, only as their name is seen upon some bill of fare, or as they are brought upon the table served with the highest culinary skill. Few feel that they can afford this dainty morsel, which costs a dollar a pound and upward. If you inquire of the farmer in the country whose tenants they are, you would most likely be directed to some old trees in the forest, the haunts of the golden-winged woodpecker. But the woodcock is never found on trees. You must search the hillside covered with sapling pines and birches, or the alder-covered meadow, where a stream runs down between the hills, the banks covered with rich loam, where they love to feed and rear their young. Our bird is much prettier than its cousin the woodcock of Europe, though from a quarter to a third smaller. The average weight of our bird is from seven to eight ounces; and a ten-ounce bird is a large one. Having shot and weighed a great many woodcock, I have seen few that would reach that weight. The largest bird I ever shot weighed just eleven ounces, and was the largest I have ever seen; it looked when flying nearly as large as a ruffed grouse. I well remember what a hunt I had that day among the thick alders covered with a dense foliage. At the report of the gun I had seen the bird fall, and I and my dog searched the ground in the vicinity for a long time in vain; when, looking up among the branches, I discovered the bird lodged in the forks of an alder about eight feet from the ground.

When disturbed by day the birds take wing with a sharp whistle, which has been the subject of a great deal

of discussion in the columns of FOREST AND STREAM, as to whether it is caused by the wings or by the vocal organs. Good arguments were brought forward on both sides, and I think the facts adduced went to prove that the sound is produced by both the wings and the vocal organs. When they fly by night, they can pass through the air as silently as an owl; and often in a summer evening I have seen them dart across my path noiseless and swift on their way to their favorite grounds.

Summer shooting has been abolished in Massachusetts, as it should be everywhere. I know of no shooting so enticing and exciting as for woodcock when the season is right for it. Take a day in October, when the morning is cool and bright and the air is like champagne and the frost of the night before whitens the fence rails and grass—

When the maple boughs are crimson
And the hickory shines like gold,
When the noons are sultry hot
And the nights are frosty cold.

This is the time when the woodcock is in good form, in full dress fall suit, and full of active life; if you flush him now, his sharp whistle will thrill you like an electric shock. He is up and away like a flash, and you never know to which point of the compass he will direct his flight. It requires cool nerve, good eye and quick action to stop him in his rapid flight.

Most of my knowledge of the bird has been obtained in this State, about thirty or thirty-five miles northwest of Boston. In this latitude the flight birds from the north may be expected about the middle of October or from the 10th to the 25th, depending on weather conditions. The favorite covers for the birds are known to sportsmen by such a hill, swamp, run, pasture, alders, etc. The old Smith pasture, with its dense growth of alders, where I secured my 11-ounce woodcock, Forge Pond Run, and Gilson's birches are well known to sportsmen. Town Farm Run for many generations has been a well-known resort for the bird, as well as for sportsmen. Sandy Meadow Swamp will be remembered as the place where I shot my first woodcock. When as a boy with a muzzleloading gun and a gun-shy cur dog, I entered this swamp, covered with a small growth of maples and birches, one October afternoon, the birds began to spring up at every step, going in all directions; and in all my hunting I have never flushed so many birds from so small a cover. I soon commenced shooting and missing until I began to get one out of four or five shots. After securing three or four birds my ammunition was exhausted, and the dog had left me. I started for home with my first woodcock more proud with my success than of any day's shooting I have since known. I had struck the fall flight. On my return the next morning, not a bird was to be found; they had passed in the night to warmer climes.

The late Warren Hapgood, whose interesting articles have entertained so many readers of FOREST AND STREAM, was familiar with, and an annual visitor to, most of the covers I have named, even after he had passed his four-score years.

The sportsman may lose all his earthly possessions, but the pleasure he has enjoyed afield will abide with him, and from the storehouse of his memory will come the bright visions of those autumn fields and forests that gave him health and strength for days to come, while in pursuit of those interesting birds that pass in the night.

GEO. L. BROWN.

BOSTON, Mass

A Polander in the Brush.

Editor Forest and Stream:

On the editorial page of October 15, mention is made of a game warden who was shot by two Greeks whom he had caught in the act of killing song birds. The warden should have had his gun with him and should have tried to do the shooting first. It is dangerous for a warden or anyone else to have anything to do with these men unless he first "gets the drop on them."

I once took a hand in arresting one of these song bird shooters. He did not try to shoot me. I had taken the precaution, not having my gun with me, to get his before I began to ask him any questions, but he did, after I had taken pity on him and had let him go, try to have me arrested, because, as he said, I had interfered with him and I was not "a police." I was across at the head of Misery Bay one afternoon when I heard the report of a shotgun, and started out to investigate, and found a Polander with an old muzzleloader that he was just now reloading. Waiting until he had it reloaded, I went up to him and asked to look at his gun. He must have suspected me, for he drew the gun back, but I made a grab for it and got it. "What do you find out here to shoot?" I asked. He had only fired at those little birds—robins. "How long have you been in this country?" He spoke very good English for a Pole. He said he had been here ten years. "Well, then, you must know that it is against the law to shoot those birds." Yes, he knew it was, but there were no police over here; that was why he had come here. "Any citizen can arrest you; he does not need to be a policeman. Now, I can take you over to the city myself. Have you a permit for this gun?" No, he did not need any; this was a free country.

"Yes, it is supposed to be; but you must get a permit before you use this gun again. Then you can't shoot robins with it, either. That permit will cost you \$10. It is hardly worth that to you. You might as well throw the old gun away. Now, I can take you to town and prefer three charges against you. The fine for each will be \$10, and I will get half of it. But I do not want to take

money from you men; you have to work hard for what little you do get."

Yes, he hardly ever got more than a dollar and a half a day, and was not getting even that now. These men were on a strike just then.

"Yes, I know," I told him. "Well, you travel off home now and put that gun away. If I ever find you with it over here again I will take you to town and have you fined."

I discharged both barrels of his gun to be on the safe side, then handing it to him told him to get it home and leave it there.

About ten days after this I met one of the ward constables up town and was hailed with, "See here! Do you know that you came near having a policeman with a warrant after you the other day? That Dago you took the gun from over on the peninsula came into our office and wanted a warrant for you. The 'Squire would not give him one, but told him that you should have brought him to him, then he would have given him a fine."

"I'll do it next time, tell the 'Squire."

Men never know when they are well off. I did not want that man fined on account of his wife and children. If I find him and his gun over there again, he won't want any warrants next time. I'll provide the warrant for him.

CABIA BLANCO.

Massachusetts Sportsmen.

BOSTON, Oct. 27.—*Editor Forest and Stream:* It begins to look as if the old Bay State were approaching the point where it will be dangerous to violate fish and game laws. The labors of game wardens the past two weeks seem to eclipse all previous records. In the fourteen days prior to October 27, thirty-five arrests have been made by deputies in Massachusetts. Of these, two were deer cases, one resulting in a fine of \$100; the other is still in court. Twelve were for killing song and insectivorous birds, fines \$290; eighteen for Sunday hunting, fines \$180; two for ferreting, \$40; one short lobster case, \$35; making a total in fines of \$645. These arrests were made in ten cities and towns in different parts of the State. This activity on the part of the deputies is very encouraging, as it indicates progress toward the development of a system of enforcing the laws that will eventually be very effective, provided a sufficient number of men of the right stamp are put into the field.

There is no question that public sentiment is very strongly in favor of a strict enforcement, nor is there any question as to the ability of the State to provide the means requisite to secure it. If any of the laws run so far contrary to public approval as to render their enforcement an impossibility, they should be replaced by such as can be enforced. When a law becomes a "dead letter" it is not simply innocuous, it is harmful, it engenders a disregard of all laws.

Our commissioners and their deputies are doing a great work, and during certain periods of the year their numbers should be increased considerably, perhaps to twice the number now employed on a salary.

From Cottage City comes a complaint that a "party of Boston gunners" wantonly slaughtered 180 ducks one day this week, including some canvasbacks and redheads. This has excited great indignation among the local sportsmen, but, under the law, I see no redress. Such reports tend to prepare one to favor putting a limit upon the bags that may be killed in a day. Another report is that at the place above named and Edgartown the people are "up in arms" at the violation of what they regard as the "unwritten law of the county" in regard to shooting ducks. There is a mutual understanding among the local sportsmen, says Mr. J. E. White, of Edgartown, that "no gunner shall go out into the Great Pond in Edgartown or into any other pond in the county and fix up a boat resembling a brush stand for the purpose of shooting ducks." The chief offender is the commander of the State police boat, the Lexington, who is reported to have said that he cared nothing about what the local people said, that he was going to "shoot ducks in his own way." It is customary for the owners to lease gunning points on the island, for which they receive from \$20 to \$300 a year, which is all the income the land yields. The people say they will call the attention of the proper authorities to what they term the "setting at defiance the rights of the people" by a State officer. Aside from the above, your correspondent has heard complaints from interested persons in regard to the manner in which the Lexington has been used. The work for which the boat was designed comes legitimately under the Fish and Game Commission, but several years ago, when the Ocean Gem was used, the boat was taken out of the hands of the commissioners and given over to the State police under the late Chief Wade.

From Essex county reports come in that partridges as well as quail are scarce, and some sportsmen express the fear that the pheasants may be in some degree to blame for this scarcity. It may be there is nothing in this. If the native birds are, in fact, killed by pheasants, it would appear reasonable to suppose some of them would be found dead by the gunners. Reports indicate more pheasants in that county than elsewhere in the State.

Several letters recently received complain loudly of the devastations of foxes and urge the enactment of a law providing for the payment of a bounty upon them as one of the most effective measures for saving the game birds. One of our good farmer friends, Deputy A. M. Lyman, of Montague, writes that he hears of a deer having been recently killed in his section, and he is using every means at his command to find the guilty party, but he thinks it is like "hunting for a needle in the haystack."

Mr. I. O. Converse, of Fitchburg, writes about game in that section as follows: "We are having a nice flight of woodcock just now, and some very good bags are made. Partridge shooting is better than last year; in fact, is very good. Quail are scarce, but still quite a number have been flushed, but we have not shot any." The last statement is gratifying, and I sincerely hope there will be a general abstinence from the killing of quail in our State this year. The circular letter sent out by the State Association just before the opening of the shooting season to the various clubs, requesting hunters to spare the quail, appears to have met with a favorable response everywhere.

A run through Faneuil Hall Market yesterday disclosed a supply of game birds, venison, and bear meat somewhat in excess of the amount commonly seen there at this season.

The A. D. Thayer party of two gentlemen and their wives returned this week from Moosehead, bringing three deer. They went into camp about twelve miles from Kineo, on the western shore of the lake. Mr. Thayer tells me that in his judgment, from what he saw and heard on this trip, deer are as plentiful in that section as they are at points further back in the wilderness.

President Hinman, just back from a two weeks' trip, brought home a moose.

Dr. Heber Bishop has recently visited his camp at Clearwater with two companions. Ex-President Reed and Mr. W. N. Boylston are at Princeton for woodcock. This is a favorite resort with both of them, and they know just where to look for the birds.

It is currently reported that there are now 2,000 non-resident hunters in Maine; probably more than half of them hail from Massachusetts. There is so much water in the low lands and swamps that the deer are to be found on the ridges, so that hunting them is unusually difficult for this time of the year, but the great majority of hunters are meeting with fair success, especially the veterans. The total shipment from Bangor to yesterday (October 28) is 1,092 deer, 64 moose, 26 bears; as against 1,281 deer, 55 moose, 18 bears for the corresponding period of 1903.

At Lake Debsconeag, Maine, are Mr. and Mrs. J. H. Williams, of Boston, several from New York and Philadelphia, and Mr. and Mrs. George Gray and two daughters from Oldtown. Mr. L. C. Moody, of Boston, was the first to secure a deer. Harold Johnson, one of the guides, shot the first moose of the season in sight of one of the camps.

One of the biggest bears ever killed in Maine was shot recently at Norcross by the cook in one of the camps. He weighed about 400 pounds. Mr. O. W. Bragdon, of Boston, in Township 22 on Union River, secured a moose said to be the finest of the season. Its weight is given at 800 pounds. It had a fine set of antlers with very wide palms. Mr. Bragdon also secured two fine deer. The young man is known in Boston as an athlete, and his record as a nimrod will be hard to beat.

CENTRAL.

A Hunter's License Decision.

SPRINGFIELD, Ill., Oct. 28.—*Editor Forest and Stream:* I beg to hand you herewith copy of a decision of the Supreme Court of Illinois, on the constitutionality of the non-resident license law, and other questions involved in the Illinois law, in a case brought against H. J. Cummings, of St. Louis, Missouri, who was convicted in the Circuit Court of Greene county, this State, for hunting protected game without first taking out a non-resident license.

You will note that the decision is a splendid victory for the Game Department of the State of Illinois, and will meet with the hearty approval of all sportsmen who favor the non-resident license as a splendid means of game protection.

JOHN A. WHEELER,

State Game Commissioner.

The text of the decision is as follows, being given here practically in full:

On October 22, 1903, plaintiff in error, Henry J. Cummings, was fined \$25 by a justice of the peace of Greene county for hunting game with a gun without having a license, as prescribed by section 25 of chapter 61 of Hurd's Statutes of 1903. From this judgment he prayed an appeal to the circuit court where the case was heard by the court without a jury, upon an agreed state of facts, which is substantially as follows:

"That the defendant, on the 21st day of October, 1903, before that day and ever since, has been and is a resident of the city of St. Louis, in the State of Missouri; that the defendant, on or about the 21st day of October, 1903, was hunting with a gun for game on the premises owned in fee simple in said county of Greene by the Grand Pass Shooting Club, a corporation organized and acting under the laws of the State of Illinois, and that said corporation has been so incorporated and acting as such corporation for several years past, and has been the owner in fee simple of about twelve hundred acres of land situated in the Illinois River bottom, in said Greene county, and that defendant, on the date above stated, did so hunt for game on said land, and at no other place whatsoever; that the defendant, Henry J. Cummings, on the day when he was so hunting on said premises and for which this prosecution has been instituted, and for some time previous thereto, was a member of said corporation and a bona fide stockholder in said corporation; that said corporation, on the 12th day of September, 1903, adopted a resolution authorizing and inviting each member and stockholder of said corporation, at any time thereafter during the ensuing year, to visit said club and to hunt for game with a gun on the lands of said corporation above stated, and so situated in Greene county; that the said defendant, Henry J. Cummings, in company with one of the directors of said corporation, on the date above stated, was on said premises, in said Greene county, with said director on the above date stated, and with said director and by reason of the resolution referred to above, and by reason of being a member of said corporation and a stockholder thereof, on said premises with a gun, for the purpose of hunting, and was then and there so hunting. It is admitted that the Grand Pass Shooting Club is a corporation organized under the laws of the State of Illinois, and has been such corporation since August 27, 1887; that said corporation for several years last past, and up to this date, has been continuously, and is now, the owner in fee simple of about twelve hundred acres of land situated in the Illinois River bottom, in said Greene county, which it has inclosed, and on which it has erected a club house and other improvements; that the said corporation, in September, 1903, as such corporation, adopted a resolution of record inviting all the members and stockholders of the said corporation to hunt, at any time thereafter during the ensuing year, with a gun, for game, during the proper season, on the said premises of said corporation, in said Greene county; that the said defendant, Henry J. Cummings, did so hunt with a gun on the said premises on the date claimed by the People,

that is to say, within eighteen months past, for game on said premises and by reason of the resolution adopted by said corporation, as above stated; that the said Henry J. Cummings, at said time last named, had not procured from the proper authorities of the State of Illinois a license to hunt, pursue or kill with a gun any of the wild animals, fowl or birds that were then protected by the laws of the State of Illinois."

Upon the submission of the case on the above state of facts, no other evidence being offered by either party, the defendant submitted to the court the five following propositions of law, which he asked to have held as the law applicable to the case:

1. "That the proviso to section 25 of the act for the protection of game, etc., in force July 1, 1903, is valid and binding.

2. "That the proviso to section 32 of the same act is also valid and binding.

3. "That the defendant, Henry J. Cummings, being a member and stockholder of the Grand Pass Shooting Club, had a right to hunt with a gun on the premises owned by the said Grand Pass Shooting Club, and violated no law in so doing at the time alleged in the complaint.

4. "That the defendant, Henry J. Cummings, being a member and stockholder of the Grand Pass Shooting Club, and being invited by the resolution of said corporation to hunt on the premises owned by the said corporation, in said Greene county, with a gun, for game on the lands of said corporation, in said Greene county, and having so hunted on said lands within proper season by such invitation, is not guilty of the charge alleged against him in this cause.

5. "That under the evidence in this case the defendant, Henry J. Cummings, is not guilty of the charge alleged against him in the complaint in this cause."

The court marked the first proposition held and the others refused, and found the defendant guilty as charged in the complaint. He entered his motions for a new trial and in arrest of judgment, but both motions were overruled, and thereupon the court rendered judgment against him for a fine and costs, to which he then and there excepted.

MR. JUSTICE WILKIN delivered the opinion of the court:

Section 25 of chapter 61 provides as follows: "For the purpose of increasing the game protection, * * * no person or persons shall at any time hunt, pursue or kill with gun any of the wild animals, fowl or birds that are protected during any part of the year, without first having procured a license so to do, and then only during the respective periods of the year when it shall be lawful. Said license shall be procured in the following manner: * * * And said applicant, if a non-resident, shall pay to the county clerk the sum of \$15, together with the sum of 50 cents as the fee of the county clerk, and if a resident, shall pay to the clerk of any city, town or county the sum of \$1 as a license fee, together with the sum of 10 cents as the fee of the city, town or county clerk for issuing such license; * * * Provided, that the owner or owners of farm lands, their children or tenants shall have the right to hunt and kill game on the farm lands of which he or they are the bona fide owners or tenants,* * * without procuring such resident license."

As shown by the foregoing statement, the court below held said section valid at the request of the defendant, but it is now attempted to be maintained by his counsel that it is unconstitutional and void—first, because it is in conflict with section 2 of article 4 of the Federal Constitution, which declares that "the citizens of each State shall be entitled to all privileges and immunities of citizens in the several States," this section of the statute providing for a different fee to be paid by non-residents from the fee charged to residents; second, because it is in conflict with section 1 of the fourteenth amendment to the Federal Constitution, which provides that "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, nor shall any State deprive any person of life, liberty or property, without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws; third, because it infringes upon the exclusive power of Congress, under section 8 of article 1 of the Federal Constitution, to regulate commerce among the several States.

An examination of these several objections to the validity of the statute will lead to the conclusion that neither of them can be sustained, and we are clearly of the opinion that the trial court ruled properly in holding the statute valid. Upon this record, however, that question is not before us for decision. That a party to a suit cannot ask the trial court to hold a proposition of law applicable to his case and then assign for error such holding is too clear for argument. The validity of section 25 was not questioned upon the trial by proper propositions of law, and it cannot, therefore, be questioned here. * * *

The next ground of reversal is that the decision of the court below was contrary to the law and the evidence, for the reason that the defendant, being an owner of stock in the Grand Pass Shooting Club, was an owner of real estate belonging to that corporation, and by virtue of such ownership acquired an equitable title to the game on the land of the corporation, which he had a right to take independently of the provisions of the statute. The proviso to section 25, as shown above, is, "that the owner or owners of farm lands, their children or tenants shall have the right to hunt and kill game on the farm lands of which he or they are the bona fide owners or tenants, during the season when it is lawful to kill game, without procuring such resident license." This provision having been held valid with other parts of section 25, the defendant could only avail himself of the exception by bringing himself within its limitations, and this he failed to do for several reasons. First, being a stockholder in the corporation gave him no right, title or interest in the real estate owned by the corporation. "A share of stock may be defined as a right which its owner has in the management, profits and ultimate assets of the corporation." "With reference more particularly to the essential nature of shares of stock, it has been well settled that such property is personality, and not realty. It is said that a share of stock is not real estate; has nothing to give it the character of real estate; is not land, nor a hereditament, nor an interest in either of them." "It is now a well established principle that the shares of the capital stock of corporations are personal property. And this applies equally to all corporations, including those whose property consists of real estate, although attempts

were formerly made to give to the stock of those companies the character of an interest in real estate. Sales of stock are therefore excluded from the provisions of the statute of frauds regulating conveyances of real estate or interests in real estate." "A stockholder has no legal title to the corporation property, or to any separate part thereof, until a division is made on the winding up or dissolution of the corporation, and prior to that time he has no right to take any of the corporate property for his own purpose." The assets of a private corporation, whether consisting of real estate or personal property, belong to the corporate body, and the stockholders are not in any sense the owners thereof. We think this proposition so well established that the citation of authorities in support of it unnecessary.

The language of the court in *In re Eberle*, 98 Fed. Rep. 197, is applicable to the present case. There the defendant was arrested for hunting in a preserve in Henderson county, this State, and brought habeas corpus proceedings in the United States District Court for the Northern District of Illinois. The land upon which he was charged with hunting was owned by a corporation in which he held stock, as the defendant did in the case at bar. There the defendant was a non-resident, and contended that, being an owner of land in Illinois, he could not be put on a different footing from residents, and that the attempt to discriminate against him deprived him of the equal protection of the law. The court, in the decision of the case, said: "In his petition he states that he is a member and stockholder in an Illinois corporation, which corporation is the owner of land on which he was hunting at the time it is alleged he violated the statute. Without, therefore, determining whether a non-resident land owner would be relieved from the provisions of the statute in question when shooting wild game upon his own premises, I deny the petition on the ground that the allegations thereof do not entitle the petitioner to the relief prayed. * * * The sovereign ownership of wild game is in the State, in trust for the benefit of its citizens, and a statute requiring the payment of a license by a non-resident for the privilege of hunting such game within the State is a police regulation within the power of the State, and not in violation of article 4, section 2 of the Federal Constitution, or of section 1 of the fourteenth amendment, although said fee is not required of residents of the State." We concur in the reasoning and conclusions thus announced.

In the next place, it does not appear that the lands upon which the defendant was charged with hunting without a license were farm lands, but, on the contrary, the agreed statement of facts tends to show that the twelve hundred acres owned by the shooting club were a game reservation owned and used by it as such. It will be seen that the proviso above quoted permits the *bona fide* owners of farm lands, or their tenants, during the season, etc., to hunt on the same "without procuring such resident license." The title to wild game is in the State, without reference to the ownership of the lands upon which it may be found, and the State has the undoubted right, therefore, to protect and prohibit or regulate the taking or killing of the same. "And a game law is not invalid because it provides greater restrictions and severer penalties against non-residents than against residents." The manifest intention of the Legislature in adopting the proviso to section 25 was to permit the owners of farm lands residing in this State, and their children or tenants, to hunt upon those lands, within the other limitations of the statute, without obtaining a resident license so to do, and not to extend that privilege to residents of other States or countries.

It is again insisted that even though section 25 is valid and the plaintiff in error does not come within its proviso as an owner, still the court below erred in refusing to hold that section 32 was valid, and that under the proviso thereto the defendant should have been acquitted. That section provides for the repeal of laws previously passed for the protection of game, and the last clause is as follows: "Provided, that nothing in this act contained shall apply to persons hunting on the land of another person by invitation of such land owner." The Circuit Court held this provision invalid, and the defendant preserved exceptions to such holding. The question for our decision on this branch of the case is whether such exception or proviso is so repugnant to the balance of the act as to be invalid.

It is a well settled principle of law that an act of the Legislature shall be construed, if possible, so as to give effect to the intention of the law-makers, which intention must be ascertained from the language of the act itself, if it be possible to do so, and if it consists of several sections, they must be considered and construed together in order to arrive at such intention. By section 25 it was the manifest purpose of the Legislature to require persons residing out of this State, owning land here, to obtain a non-resident license to hunt or take game on such land, and it certainly was not the intention to require an owner of farm land who was a non-resident of the State to pay a license fee of \$15 for hunting upon his own land, and at the same time permit him to authorize others, by mere invitation, to do so without a license. But that proviso is not limited to section 25. It is general, and applies to every section in the act which contains anything in conflict with it. If valid, so construed, a person would be authorized to hunt at any season of the year, in any manner, without limit as to the amount of game killed or taken, if, forsooth, the owner of the land on which he hunted had invited him to do so. To give it that construction would lead to a defenseless incongruity.

It is a well-known rule applicable to the construction of statutes, that a saving clause must be rejected when it is directly repugnant to the purview or body of the act, and cannot stand without rendering the act inconsistent and destructive of itself. We are of the opinion that the last clause of section 32, which expressly exempts persons who are hunting on the land of another by the invitation of such land owner, from taking out a license, literally construed, is so repugnant to the balance of the statute as to render all of the statute ineffective, and as this was manifestly not the intention of the Legislature, the clause must be held invalid, except in so far as it can be given a limited effect. The purpose of the Legislature doubtless was to authorize the owner of lands to invite another person to do that which he might himself lawfully do, and so construed the proviso can be sustained, but as applicable to the facts of this case the court was clearly right in holding it invalid.

We find no reversible error in this record, and the judgment of the Circuit Court will be affirmed. Judgment affirmed.

New Jersey Non-Residents Again.

We are told that certain New Jersey game wardens do not permit the export of wildfowl, snipe, and mud-hens killed by non-residents. As the law contains no prohibition of export of these species, the actions of the game wardens are, as King Edward wrote of Admiral Rojestwensky's cannonading the other night, "unwarrantable." The New Jersey export law relates only to quail, ruffed grouse, pinnated grouse, woodcock, hare, rabbit, squirrel, English pheasant or ring-necked pheasant (unless killed on preserves). If the exportation of other species of game be interfered with, interference should be resented and resisted.

PRINCE'S BAY, N. Y.—*Editor Forest and Stream*: You speak of the apparent uncertainty as to what the non-resident can shoot in New Jersey. I am informed that a non-resident cannot shoot woodcock in the State without first obtaining a license, but as the law reads, it seems that woodcock are called snipe, and a non-resident can shoot "wild water fowl, snipe and mud-hen (marsh-hen)." New Jersey fish and game laws, in an act approved April 14, 1903, Sec. 1, puts the woodcock where it belongs—"Limicolæ, sandpipers, willets, marlin, yellow-legs, plovers, tattlers, woodcock," etc. Then again, in "an act for the protection of birds and their nests and eggs," approved March 20, 1901, the woodcock is properly classed with the snipe family. The only reason that has been explained to me why a non-resident cannot shoot woodcock in New Jersey, is that the woodcock refuses to associate with the sandpiper, etc. Can this be right? ***

[In the several sections of the law, other than the Sec. 1 quoted by our correspondent, treat woodcock and snipe as different birds; and there is no uncertainty or want of specification to make it clear that the non-resident must have a license to shoot woodcock.]

Vermont Game.

HYDE PARK, Vt., Oct. 27.—*Editor Forest and Stream*: The shooting season (since September 1) in this part of the State has so far proved quite satisfactory. Grouse are now more plenty than they were the past two years, and very much more plenty than last year. It is not difficult to get from ten to twenty shots a day, which, with fair shooting, ought to result in the legal limit of five birds. An unusually good nesting season, with an abundance of feed throughout the summer and fall explains their increase. Woodcock were also found in fair numbers, the writer having on several different days started at least ten birds from their covers.

The deer season opened last Saturday with apparently all the arms-bearing population let loose. During the day firing was heard all along the line, and in the evening three deer were reported killed, one Jersey cow, and a hunter narrowly escaped death, a bullet passing through a canvas coat he was carrying on his arm. Several fine bucks have been brought into town, and the number reported killed in the country is already much larger than last year. Snow sufficient for tracking fell last night, and this will still further increase the score.

The day before the season opened, Governor Bell signed a bill providing that non-resident deer hunters should take out a \$15 license. Applications for such licenses were received by the town clerks on opening day, after probably the majority of non-resident hunters had been in the woods several days. One non-resident who accidentally learned of the new law while in the woods, pulled in Sunday. He expressed himself to the effect that the quick work of the Legislature was pretty hard on him after paying his fare up from Boston with the expectation of free hunting here. That the State will receive any amount of revenue from such a license, I very much doubt. A charge of \$15 for eight days of such hunting as Vermont offers, would seem to me little short of prohibition. I would much rather see the sawdust kept out of the trout brooks, and believe if this were done we would get much more of the non-residents' money.

H. A. NOYES.

Long Island Ducks.

BAYPORT, L. I., Oct. 29.—*Editor Forest and Stream*: The first week's battery shooting here has been very successful for so early in the season. Ducks are in the bay in large numbers, and shooting is good, as may be judged from the fact that Captain Brown with one gun and four separate barrels got four ducks from one flock. The largest bags made here this week were Mr. Purdy, of New York, 37; Mr. J. Suydam, 40 in two days; Mr. Runyon, Newark, 30; Mr. S. G. Painter, New York, 12; Mr. Frank Hobson, New York, 13. Others here from Manhattan who had good sport were H. B. Goodwin, W. P. Peckham, C. A. Ross, A. J. Martin, J. E. Douglass, R. Rodman, L. C. Connolly, and G. Still. The ducks are fat and in good condition. The outlook for quail and rabbit shooting, which opens Tuesday, is very good; the birds are well advanced and strong, and the rabbits more numerous in this locality than for some years past.

HENRY STOKES.

EAST QUOGUE, Long Island.—Ducks shot last week by guests at my house as follows: October 17, 20; October 18, 13; October 19, 11; October 20, 6; October 21, 15; October 22, 32; a total of 95, or an average of 19 per day. October 24, 34; October 25, 7; October 26, 12; October 27, 16; October 28, 8. Friday's storm brought a flight of mallards, widgeons, sprigs and gadwall or gray ducks, with a few blacks and redheads. The shooting of ducks with changes of weather is quite fair. More mallards and widgeon are here than in October, 1903.

E. A. JACKSON.

Quebec Moose.

AYLMER, Quebec, October 27.—Mr. E. J. Chamberlin, general manager of the Canada Atlantic Railway, writes to Provincial Game Warden N. E. Cormier, October 14: "We had a most pleasant outing at Kippewa, and each of the party secured a moose. Those secured by Mr. Guild and Mr. Megeath had rather small heads, but mine, I think, was above the average. We had fairly good weather, and enjoyed the scenery and outing very much."

SEA AND RIVER FISHING

Silkworm Gut.

TO EVERY true sportsman the study of natural history has a certain fascination, and to the angler that little understood but most important component of a fisherman's outfit, gut, presents a study which is of exceeding interest. Silkworm gut is a long gland or sac taken from the silkworm at a certain period of its growth, when it is found to be filled with a fluid which is nothing more or less than embryo silk, and which, under certain treatment, condenses and forms a solid cord or strand, which is the article used in the manufacture of our leaders, snelled hooks, etc.

The center of production of silkworm gut is Murcia, the capital of the Province of that name in southeastern Spain. Here is situated a beautiful and picturesque valley in which are cultivated the mulberry trees which produce the leaves on which the worms are fed.

How strange it must seem to the modern angler that away in this remote country, where the gentle art has never been cultivated, and where, in fact, it is almost impossible to find the recognized implements for fishing, the discovery of the properties of silkworm gut was made, and for generations its cultivation and production located.

Although experiments in raising worms for the sake of the gut have been made in many other localities, none have been very successful, the natives of Murcia asserting that the local growth of mulberry has some peculiar property which produces the results obtained with them.

Now, as to the methods of raising the worms and preparing the gut: The eggs from which the worms are hatched are imported in the spring of the year from Italy, principally from the island of Sicily. These are purchased by the Spanish peasants, who hatch out the worms by placing the eggs between the mattresses of their beds, the heat so generated having the desired effect.

As soon as the worms are large enough to handle, they are collected and placed on shallow shelves, which line the living rooms of the peasants' cottages, and are fed three times a day on fresh mulberry leaves. For several days they feed ravenously, until they attain full growth, and the silk glands (of which each worm has two) are congested with the fluid which would, if left for further development, produce silk fibre. They are then killed by immersion in a weak solution of sulphuric acid, which at the same time hardens the skin or outside shell of the worm and congeals the fluid contained in the glands, producing a solid cord or strand of gut.

Now the worms are ready for the final preparation, and in the early days of May they are disposed of by auction in the public market of Murcia to the gut manufacturers. When the worms reach the hands of the gut manufacturers (of whom there are some half-score in Murcia, employing in the aggregate about a hundred and fifty hands), they are first of all stripped of their shells or outer skins, exposing the congested glands or guts of various lengths and thicknesses, to which is found adhering a certain quantity of yellowish fleshy substance. These guts are softened by soaking in warm water, and then with one end attached to a hook fastened in front of the workman and the other end attached to a clamp, they are stretched to their full natural length. They are then cleaned of the superfluous animal matter by means of potash and bleached by exposure to the sun. After this the strands are polished by rubbing between strips of chamois leather and then passed on to the sorting and classification department. This sorting is done by women and girls, who, receiving the gut in bundles of fifteen to twenty thousand strands, first of all separate into the various lengths, after which all faulty strands are thrown out. These latter constitute an inferior quality or grade technically termed "estriada" (Eng. striated), and are

usually the gut from worms which were diseased or had become bruised and damaged in handling. Then the various grades as detailed below are sorted out. This is a process requiring considerable care and skill, as everything is left to the judgment of the operator, no gauge or other mechanical appliance being used. The stock, now separated into lengths and grades, is passed on to the packers, who, taking the various lengths of each grade, first tie it in bunches of one hundred strands and then into bundles of ten bunches or one thousand strands. This is the form in which it reaches the hands of the manufacturers of fishing tackle.

Of course it is understood that the worms, being of various sizes, naturally produce gut of different lengths and thicknesses, which for commercial purposes are classified as follows:

1. *Refina*, which is the finest texture, and which is used generally for small brook trout fishing.
2. *Fina* is a trifle heavier in texture than *Refina*.
3. *Regular*, heavier still than *Fina*, and suitable for ordinary trout or similar fishing.
4. *Padron 2* } Grades heavier in texture to No. 3, and
5. *Padron 1* } used in tackle for bass fishing.
6. *Marana 2* } Heavier strands yet than the *Padron*
7. *Marana 1* } classes; suitable for small salmon and for salt-water fishing.

And finally Imperial and Royal grades, of which the production is very limited. These grades are almost exclusively made into single leaders for the heavy salmon fishing in Ireland and Scotland.

The lengths of gut strands vary from eight to sixteen inches, running longer in the finer grades, the most general length, however, is about eleven inches.

Although silkworm gut is generally associated with angling, it has other uses, and during the last few years it has almost superseded silk thread and silver wire used in surgical operations, as, being absorbed by the sutures, the annoying operation of withdrawing stitches is obviated.

The annual output of the Murcia factories is about 120,000,000 strands, of which some 30,000,000 in one form or another finds its way into this country.

THOMAS PERRY.

Visible Results of Salmon Culture

Editor Forest and Stream:

In your issue of October 22, Mr. Edward A. Samuels has given us another of his instructive "Fish Chats," for which his long experience as an angler in many waters, and his habits of painstaking and correct observation eminently qualify him. The Old Angler is only too willing to sit at his brother's feet and learn from him much that, despite his own long and varied experience, is both new and interesting. But when he discourses on the practical results of salmon culture in the United States and Canada, his aged friend regrets that he must challenge almost every statement made. In his last paper he quotes largely from the "experts" of several hatching houses to show the correctness of his opinions and the fallacy of my inferences.

Alexander Mowat, the expert of the Restigouche house, tells him that "all travelers up and down the river with whom I have been talking say they have never seen salmon more plentiful than they were this year, and the guardians are unanimous in corroborating this."

Your readers will take note that Mr. Mowat speaks entirely from hearsay. Now, let us see what the Reports of the Commissioner of Fisheries say as to the catch of this district, made up from the sworn returns of guardians and overseers. In the report for 1886 the catch of the Restigouche district is given as 314,926 pounds. The Report for 1902 gives the catch in the same district as 304,000 pounds. In the interim between these years there was planted in the rivers of the district over 27,500,000 fry, and yet the fishermen and anglers all agree in saying that the fishing this season was the worst ever known, as the official report will show when published.

L. N. Catellier, the expert of the Tadousac hatching house, tells Mr. Samuels that Simon Dufour told him that he never saw so many salmon on the spawning grounds for the last twelve years, and that the member of Parliament for Charlevoix told him that the planting of salmon fry in the River Murray was a success. Before the hatching house at Tadousac was built the catch of salmon in Quebec Province was carefully estimated from the partial returns of fishery officers at 1,500,000 pounds. After planting 105,889,000 young fry, the catch for 1902 is given in the commissioner's last report as 985,883 pounds. The season just passed was reported in your columns as the worst ever known. This is also the statement of the veteran angler, Walter M. Brackett, of Boston, who has fished the Ste. Marguerite for the last twenty-five years. In a letter now before me, written last month, he says: "Like many others, my season's sport has been a sad failure—only 9 fish, against 73 last year. I was once an advocate for artificial culture, but I have been forced to change my mind by the total absence of any results. For the last fifteen years from 50,000 to 400,000 young salmon from the Tadousac hatching house have been annually put into my river without any visible results. In fact, there are less fish in the river now than there were ten years ago."

Alfred Ogden, the expert of the Bedford house, in Nova Scotia, reported that "Bedford Basin and Sackville River are each year showing a large increase in salmon; that some had been caught with the fly in the river, and quite a number have been taken in nets in the basin." The father of the present writer served his apprenticeship in Halifax. In his day Bedford Basin and Sackville River were the principal sources of the salmon that supplied the city and garrison. But let us see what this "large increase" is from the planted fry. In the year the hatching house was built, the catch of salmon in Nova Scotia is given in the official report as 1,758,818 pounds. After planting 81,882,500 young salmon, the catch in 1902 was 556,386 pounds. So much for the evidence furnished by expert Alfred Ogden, which is of the same character as that given by expert L. S. Ford, who could distinguish the progeny of the fry from four different rivers!

Mr. Samuels quotes Isaac Sheasgreen, the expert of the Miramichi house as follows: "While considerable evidence could be given to demonstrate the benefits re-

sulting to the waters of Miramichi from the operations of this hatchery, I feel that, as the work of keeping up the supply of salmon has been so thoroughly proved successful, it is needless to adduce any other evidence than that the statements made from all reliable sources show that the salmon fishing and angling during the past year have been well up to the average, and show no signs of decrease." William Sheasgreen, of the same house, informs Mr. Samuels that "it is conceded by nearly all the fishermen of the Miramichi that salmon culture, as carried on here, has been a great factor in supplying the demand that is annually made upon this fishing in these waters." This much for hearsay. Now let us see what the Commissioner's Reports say. That for 1874, before the hatching house was in operation, gives the catch of salmon in New Brunswick as 3,214,182 pounds. After 29,300,000 fry had been planted from the three hatching houses, the catch in 1902 was 1,120,150 pounds. I am quite at a loss to see how experts Sheasgreen have helped the contention of Mr. Samuels.

Mr. H. K. Thomas, the proprietor of a hatching house in Vermont, sends Mr. S. the following: "I am convinced that the planting of salmon fry has been successful. Only a few years ago there were no salmon in Vermont waters. Lake Caspian, Willoughby Lake, and several ponds have been stocked with salmon fry, which have seemed to thrive and are vigorous and healthy stock, and this year many good catches have been made." No data are given as to the number planted in order to furnish the "many good catches" that were made this year, and I can only accept Mr. Thomas's statements with as small grains of salt as my own knowledge of salmon hatching and planting will allow. But I must be permitted to express my great surprise that the fry of *Salmo salar* not only thrived in lakes and ponds along with maskinongé, but, in "a few years gave many good catches"!

Had Mr. Samuels not assured us in previous letters on this subject that nothing could be said to change his convictions, I should hope he would see some difference between the hearsay of interested "experts" and the Department Reports of a Government. To this writer it is passing strange that the mere expression of opinion on matters quite beyond their knowledge is taken by Mr. S. as proof of absurdities. That they are so taken would appear from the following *Io triumphe* with which he concludes his paper: "The above statements show conclusively that The Old Angler is not without a degree of error, * * * and that my claim is correct—that the time and money which have been expended on salmon culture have not been wasted."

No one knows better than Mr. Samuels how seldom salmon fry of six weeks old are seen on the rids, which in the months of April and May are deep under water. Never but once has the present writer seen salmon alevins in their native streams, and then it was but a mere glimpse. To make a comparison as to "health and vigor" between them and the fry artificially hatched was quite beyond his power, and he can only envy those "experts" who have succeeded where he failed. None should know better than Mr. S. that the persons to whom he sent his questions are those least able to answer them, and the least likely if they could to answer them truly. In expecting an expert fish-hatcher to tell him anything depreciating his "science," my friend has shown an amount of *naïveté* that is very refreshing in these days.

THE OLD ANGLER.

HARRISBURG, Pa., Oct. 31.—Editor Forest and Stream: I was very much interested by the note in your issue of October 22, entitled, "Is Salmon Culture Profitable?"

I think I can strengthen the position taken by Mr. Edward A. Samuels, the writer, by detailing certain results which followed the planting of Atlantic salmon in the Delaware River.

In the early '70s, Thaddeus C. Norris and a number of other enthusiastic fishermen planted several thousand Atlantic salmon fry in the tributaries of the Delaware River near Easton, Pa. I think the total number planted in two years was 50,000. The eggs were hatched in New York State. Although it consequently transpired that the tributaries of the Delaware River in which these fish were placed were not the most favorable waters, a number of salmon lived and returned to the Delaware River. Probably thirty or forty were caught, but at the time the experiment was considered to be unsuccessful.

About 1890, the late Henry C. Ford, then President of the Pennsylvania Fish Commission, planted several thousand fry in tributaries of the Delaware River in Pike and Wayne counties on the Pennsylvania side. In 1895 more than \$5,000 worth of Atlantic salmon were caught in the nets between the head of the Delaware Bay and Trenton. In 1896 and 1897 I planted several thousand more fry. The result has been that since quite a number of salmon have been caught in the nets of the shad fishermen, and one year it was estimated that nearly \$3,000 worth were captured.

It should be stated that before the fry had been planted by Thaddeus C. Norris and his friends, salmon was absolutely unknown in the Delaware River. The experiments of Mr. Norris, Mr. Ford, and myself have demonstrated very clearly that by persistent stocking the Delaware River can be made a fine salmon stream. I myself saw several salmon in one day in a large pool near Dingman's Ferry, and a number of dead spent salmon have been found in tributaries of the Delaware along the Pike and Wayne county lines within the last six or seven years.

With the results which have been achieved by Pennsylvania and New York States and the United States through stocking with fish reared in hatcheries, it is astonishing that there can be any man living to-day to question the value of stocking.

Grilse and Other Fish.

Editor Forest and Stream:

In your last issue Mr. Brown comments on my little sketch of "Grilse on a Trout Rod" in such a kindly and sympathetic way as to take any sting out of his very courteously expressed suggestion that my reference to trout, bass, and other fish may be hasty and inaccurate in substance and unkind in form, and that further experience would modify my opinion and lead me to express it more gently. Differences of opinion must arise on such matters, and they are too often stated without Mr. Brown's charm of manner and feeling. I am certain that the gentleman is a true fisherman, and a good one; and, in the name of our sainted Izaak Walton, I tender him the right hand of fellowship.

The true fisherman reverences and admires all the finny tribe, sees good in them all, and earnestly seeks the company of those he may find. He will revel with the salmon, rejoice with the trout, be delighted with bass, and pleased with pike, and, if denied the fairer and nobler of the race, can take comfort even in catfish. He will fish wherever and whenever possible, and be happy in doing so; but he may and must have preferences, and take greater proportionate joy as his quarry displays more and more of the dashing qualities which the title "game" denotes. John Stuart Mill says that the price of any commodity is fixed by a combination of the two factors "value in use and difficulty of attainment," and in matters of sport the latter element greatly predominates, for certainly the fact that fish and game are good on the table has but a very small part in creating the strong passion that all sportsmen feel for their pursuit. Hope, uncertainty, surprise, and the full exercise of all powers of mind and body in the struggle for success, are surely the main causes for never failing charm of angling; fish are esteemed in the relative proportion in which each variety brings these passions and these powers into keen and energetic action, and I know of no form of sport that does this so completely as fly-fishing for salmon.

The value of any fisherman's opinion, as to the relative merit of the various forms of his cherished sport, must depend on the extent and variety of his experience, and I see no way of proving that my own has any worth except that of modestly stating what I have seen and done. I am a fisherman by inheritance and family tradition, with a personal experience of over forty years, during the last thirty of which I have been devoted to the artificial fly; not that I despise or feel myself in any way superior to brothers of the angle who are addicted to other forms of the lure, but that the fly suits me best. I have taken thousands of speckled trout, from fingerlings up to four pounds in New England, the Alleghenies, the Adirondacks, the Rockies, Ontario, Quebec, and elsewhere; have caught *Purpuratus* in Colorado, *Irideus* in the West, and in Michigan grayling in the Ausable and Manistee, and small-mouth bass in countless places, best and largest in the wild waters around the upper Ottawa. I have trolled for bluefish outside of Sandy Hook, and caught them, together with Spanish mackerel and "sea trout," so-called, on light tackle in Florida; and last, and best of all, I have taken grilse in Newfoundland. Large salmon are as yet unknown to my personal experience, but if all goes as planned, there will be a story to tell about them next summer.

All this finny prey I esteem and delight in, and hope to meet again and again, and do not love the others less because I love the salmon more. Each has its merits and its peculiar charm, but the salmon has the merits and charms of all the rest and in a higher degree. He is bold and brave as a bass, and, like him, leaps and surges; wary and wily as a trout, and, like him, dashes and runs; graceful and gay as a grayling, fierce as a bluefish, and more beautiful than either. They are the nobles of Piscia, and he is its King.

A. ST. J. NEWBERRY.

CLEVELAND, Ohio, Oct. 22.

As It Is in Africa.

UNITED STATES MINISTER LYON writes from Monrovia, Liberia, under date of June 8:

I have just returned from a trip into the territory. The objective point was Dobbles Island, but the annual rise of the creeks and rivers rendered travel difficult, and we were compelled to end our journey at Kpondia Hill, the site of an important native town, the entrance to which lies hidden in a dense forest.

The Gree-Gree and Devil Bushes are secret institutions for the moral, social and religious development of the youths of both sexes. The head of the Gree-Gree Bush is called a Zoah and the head of the Devil Bush a Country Devil. The term devil has not the same significance as in our language. The location of these bushes or lodges is in the thickest of the woods. The paths leading to them are labyrinthine. Every precaution is taken to keep the uninitiated away. The weird tales told by the natives themselves, and the air of mystery which is made to surround everything which relates to them, are sufficient to guard the curious from approach. Yet, lest some man should stray accidentally into the entrance, a white cloth is tied on the tip of a pole at the head of the path as a danger signal. This is always sufficient warning. These bushes are the most popular institutions in West Africa among the non-Christian natives. Their purpose in the main is an exalted one. The Gree-Gree Bush is pledged to the preparation of maidens for their life work. It instructs them in the secrets of womanhood as well as the principles of their religion. So impressive are these lessons that Christianity itself is said to be powerless to remove the impressions in after life. The purity of those trained by them is vouched for. As a safeguard men are strictly forbidden not only to enter the lodge, but to be found anywhere in the vicinity of one. Disobedience is a grave offense. The penalty is death, and there is seldom any escape. Poison is administered by a relative if necessary to carry out the intention of the Zoah.

All the game laws and fish laws of the United States and Canada are given in the "Game Laws in Brief."

CANOEING

Officers of A. C. A., 1904.

Commodore—C. F. Wolters, 14 Main St. E., Rochester, N. Y.

How to Join the A. C. A.

From Chapter I., Section 1, of the By-Laws of the A. C. A.:
"Application for membership shall be made to the Secretary,
and shall be accompanied by the recommendation of an active
member and by the sum of two dollars, one dollar as entrance
fee and one dollar as dues for the current year, to be refunded
in case of non-election of the applicant."

In Canoe and Camp.

BY C. E. NOXON.

THERE were seven of us in the party originally, as we discussed the matter during the chill and bleak months of the winter, and each one promised, with all the seriousness of candor, that he would surely be a member on the projected trip. But Beck and I, who had brought the subject before our friends, had come to have a pretty fair understanding of the promises that spring so effusively from exuberant youth, and so were not surprised to see, as the summer dragged along, that the gentlemen who were so lavish in their assurances several months previous, began quietly to steal away, until there was nothing left of the party except the promoters. We were disappointed, but not dismayed; and according to schedule, we stepped aboard the steamer at Charlotte one beautiful morning in the month of August, bound for the Kewartha Lakes in Canada. On the boat we ran across an old friend, Fred Farber, who was making for a haven of refuge far from the maddening crowd and the torments of hay fever. We unfolded our plans, and enlisted him on the spot. At Young's Point we found the guide, Elliott Robinson, in waiting with two canoes and a complete camping outfit, which consisted of a tent, 7 by 7; ridge ropes and stakes; one rubber blanket 6 feet square, two small flannel blankets and two heavy blankets, a lantern, two small axes, a frying pan, two cooking pails, an assortment of tin dishes, knives, forks and spoons for four. Our provisions, which we secured at the store in Young's Point, I copy exactly as it came from the grocer: 1½ pecks potatoes, 4 pounds lard, 3 pounds butter, salt and pepper, 5 dozen eggs, ½ dozen boxes sardines, 1 pound black tea, 4 pounds sugar, 1 cake soap, 3 boxes soda crackers, 2 cans pork and beans, 2 loaves bread, 10 pounds bacon.

In addition to the above, we each carried a rain coat and a supply of clean clothes in two rubber duffel bags.

On the following Monday morning we put the canoes and supplies aboard the steamer Majestic, and were soon bowling along the beautiful sheet of water known as Clear Lake. It was a most auspicious day for the start—not a cloud in the sky, and the sun shone clear and warm. At McCracken's Landing we disembarked, loaded the canoes, and in a few moments dipped our paddles for a ten-mile pull up Stony Lake to Eel River, our first camping place. Too much cannot be said in praise of the scenery of Stony Lake. It is a counterpart in miniature of the vast and beautiful Thousand Island region. The lake, circular in shape, is studded with hundreds of islands of all sizes, from the little granite rock bare of vegetation, to the large boulders of earth and rock from whose freckled bosom springs the stately spruce; magnificent timberlands stretch along the eastern borders of the lake; off to the north as far as the eye can reach, rise the hazy heights of

the Blue Mountains, while nearer by on the western shore towers the verdure-clad Mt. Julian, at whose base, nestling in a beautiful valley that slopes gently to the water's edge, lies "beautiful Viamede," a favorite resort of American tourists.

In between the islands we shot the canoes, stopping here and there to marvel at the wonders of the great rocks and imposing cliffs, or pausing under the shadowy branches of some overhanging tree to rest and smoke. At length the guide, who was laying the course, made a sharp turn under the lee of an island, and in an instant we opened up a little reach of water bewitchingly lined on either side by great drooping trees, whose splendid foliage canopied the stream, and made a delightful retreat from the burning rays of the sun. Idly paddling along the sylvan stream, we soon came to a little cove, into which leaped the waters of Eel River, sending the spray in all directions. Here we disembarked and unpacked our duffel. The guide soon had a rousing fire going, and in a short time we sat down to a dinner of fried eggs, bacon, boiled potatoes, bread, butter and tea. A few peaceful moments with the after-dinner pipes, and then we proceeded to stretch the tent in a delightful pine-embowered spot only a few yards from where the river plunges over the rocks in its tumultuous course to Stony Lake. Then Beck and the guide paddled out into Stony for an afternoon's fishing, while Farber and I remained in the cove to try our luck. About as fast as we threw in the lines, those ravenous little sunfish, that are to be found everywhere there is water, would grab the bait and make off with it, and finally becoming tired of feeding to these undersized specimens worms that we had lugged all the way from Young's Point, we were on the point of going ashore, when some monster of the deep took my hook and started for home with a rush that nearly upset the canoe. Instantly all was excitement. I gave out the line, while Farber gave out instructions.

"Keep a tight line on him," said he; "don't let him double on you. I guess we don't eat to-night, eh?"

All the time the fish was fighting like a savage; the reel wouldn't work; the line had become tangled, and in the general confusion, we were in imminent danger of a capsizing. I shifted my position slightly to steady the canoe; the line slackened, and the bass shot two feet in the air. It was certainly a beautiful specimen, and I redoubled my efforts to land him. Again he broke water, and again Farber shouted his admonition to play him carefully. Swish, swish, first this way, then that, the bass darted around in a frantic endeavor to shake the hook; but slowly and surely I was working him nearer to the boat. We had no landing net, but Fred volunteered to gather him in with his cap, and was just reaching over the side to see how it would work, when there was an extra vicious tug, and the line parted. I stared helplessly at my companion, while he became suddenly interested in the scenery. I waited for him to uncork the vials of his wrath, but with a resignation worthy of a better cause, he only sighed and said, "Too bad," although I knew he had it in his heart to annihilate me then and there. We paddled ashore and rigged up another pole, but got no more strikes that day, and Farber's hopes for a fish fry were fast ebbing away, when our camp mates came in with a couple of three-pounders.

After supper Beck and I shouldered the axes and despoiled about a score of fine spruce trees of their umbrageous adornment for the more comfortable repose of our weary bones. We first piled the boughs to the depth of a foot or so on the ground in the tent, over which was spread the rubber blanket; on the latter we laid a couple of flannel blankets, and over these as a covering for ourselves, we placed a large thick hunting blanket. This arrangement afforded us ample protection from any dampness of the earth or sudden cold wave during the night, while the boughs offered a resiliency refreshing and restful alike to the tired body. Farber kicked a little the next morning, on the mattresses, sarcastically remarking that somebody had been a bit too enthusiastic in clipping off boughs and cut down a young tree, for it lay athwart his back all night. For pillows we used the kneeling cushions from the canoes thrown over the duffel bags. The lantern was suspended from the ridge rope, and this completed our work of putting the house to rights for the night.

Then we stirred up the fire, grouped ourselves around it, and with the pipes drawing well, stories piscatorial and otherwise were reeled off, until it seemed that conscience itself had abdicated. At length as the embers burned low and the night air became more chill, we crawled in under the blankets, to be wooed to pleasant slumber by the aromatic odors of balsam and the ceaseless murmuring of the tumbling waters.

We arose early the next morning, and after ablutions in the rapids and a hearty breakfast, we portaged over the rocks to an upper reach of Eel River, and thence paddled through three or four miles of wild and desolate region to the foot of High Falls. It was a dull, gray morning, and a drizzling rain seemed imminent—conditions which only heightened the bleak and forbidding aspect of the scenery. There was hardly a sound to break the morning stillness, except the occasional knocking of the paddle against the canoe, or the faint screeching of a crow far off in the distant woods. The water of the stream seemed black as ink, as we glided over its waveless surface, our trolling lines out for some unsuspecting lunge, an insult in itself to think he would inhabit such a murky stream. After portaging three times over rocks and through marshes that seemed to bid defiance to our labors, we finally arrived at the falls. Here the river makes a long and rocky descent of some six hundred feet, forming a beautiful cascade, and the view more than atones for the trouble

and time spent in reaching it. We put in an enjoyable hour of rest, and then paddled slowly back to camp, shooting some small rapids on the return by way of diversion and devilment. As it still lacked several hours of dinner time, Beck and I decided to try the lateen rig, which had not yet been used. We spread the sail out on the grass, and it looked large enough for a half-rater. We had been used to knocking around with a bat wing, but this big three-cornered rig seemed like a spinnaker. However, we were not to be balked in our determination, and forthwith put on our bathing suits. Then we clamped on the crossbar, which fitted on the gunwales just forward of the first thwart; on either side were suspended the iron leeboards, fastened by kingpins. Then we stepped the mast. On the top of this there is a pin which is clutched by a ring in the gaff of the main sail, while on the main boom there is a jawhook which fits around the mast, thus holding the sail firmly to the spar. To douse the sail, all that is necessary to do is to pull aft on the main sheet, the jaw slips, the mast and the whole canvas is scandalized in a second. We went through a preliminary drill in the cove, with Beck as skipper and myself as crew. Elliott said there was a store on the other side of Stony, and we decided to sail over and get some milk. We paddled out into the lake for a battle with the elements. The elements were there all right. We got a broadside from old Boreas that laid us over in jig time. It didn't quite upset us, but we were just as scared as though it had. Beck quickly shot the canoe up into the wind, and we lay to for a council of war. After getting our bearings, we concluded to lay the course on a diagonal, which would necessitate a buck into the wind, but which would be much safer than reaching, and we were in no hurry—to get wet. After a while, becoming more accustomed to the working of the sail, we became absolutely reckless, and more than once escaped a tip-over by pig-headed, unalloyed luck. When we got back to camp, Farber, who had been watching us from a distant island, remarked that in his opinion we were but one degree removed from downright idiocy; that he had never before seen such crazy sailing. We told him it was the most exhilarating sport yet, and invited him to go out with us in the afternoon. He declined the invitation with sulphuric emphasis, and said he wouldn't chance our seamanship in a swimming pool 10 by 15 feet in an airtight building.

After dinner that day there was little doing. We loafed around camp, smoked, played cards and slept. About 5 o'clock the guide and Beck went out after bass, while Fred and I amused ourselves catching minnows on a line. That evening as we were sitting down to supper, a skiff glided into the cove poled by a middle-aged, white-haired man, nattily gotten up in white ducks, white negligee, white hat and white canvas shoes. If he had come in after dark, he probably would have received a fusillade of bullets, so ghost-like did he appear. But as he did not, he was welcomed with that urbanity so characteristic of our camp. He was the owner of the island and cottage at the mouth of Eel River in Stony, and said his name was Grabbe. He and his wife occupied the cottage alone, and he had come over to invite us to spend the evening with them, and added, that he thought it would be worth our while. That "worth our while" was what caught Farber, and on behalf of the company he accepted the kind old gentleman's invitation, and said we would be over after supper. Farber went into the tent, and after rummaging around for a few minutes, dug up a collar, not exactly—well, it was linen anyway, and he straightway put it on. Beck combed his hair, while Elliott and I made no attempt to conceal our identity.

Arrived at the cottage, Mr. G. presented us to his wife, a very gracious and entertaining lady. We ranged ourselves on the porch and passed on from such pleasant topics as the weather and beauty of Stony Lake to the more dignified and intellectual subjects of home rule and the speed of automobiles. We lingered a while and then, thanking our hosts profusely, departed into the great solemn night. After arriving at the camp, Elliott dragged out a half dozen big pine stumps, piled them high one on the other at the water's edge, and in a few moments the heavens were red with the glare of the blazing knots. We got out the cards and played a few games of pedro on the rocks, and then silently sought our respective resting places on the balsam twigs.

But somehow I could not sleep. Try as I would, I could not woo the goddess of slumber a little bit. I tried lying on my right side, and then on my left, and at every turn uncovering my immediate neighbor and incidentally some fierce invective. Even the musical notes of the laughing water and the lay of the whip-poorwill failed to cast the magic spell, and at last, exhausted by my efforts and stifled by the close air of the tent, I arose quietly and stepped outside. I sauntered down to the water's edge, sniffing with keen delight the exhilarating ozone and contemplating with enraptured eyes the solemn splendors of the night. Save for the melody of the gurgling waters and the occasional notes of the nightbirds, all was quiet. The stately pines reared their tapering heads against the sky sombre and still, unmoved by the slightest breeze; the graceful contour of the cove was marked by the silvery sheen of the moon, while the foam-crested ripples of the rapids glinted and gleamed in a rhapsody of color. I lit my pipe, and sitting down beside the water, I thought of other days, of the days, when untrammelled by law, the red man was wont to roam the forest and paddle the streams. And in my imagination I was carried back far beyond the pale of an enlightened age, back to the time when the great forces of civilization were yet unknown. Touched by the magic wand of fancy, the

past rose before me like a dream. I saw the steamboats with their great stacks belching huge clouds of smoke and their paddles churning the placid bosom of the lake, fade away in the golden sunset of another era; I saw the beautiful cottages that stand so majestically on the rocky isles, transformed to the teepee of a barbarous age; I saw the handsome canoes of the present day merge into the little bark that floated graceful as a swan under the deft and skillful stroke of the savage; I saw the camp-fires along the shores and the weird and uncanny figures that danced and howled around them in a frenzy of fanaticism; I followed the red man on the hunt, and sat by his side, as he drew the struggling fish from the stream; I saw him steal softly out in his canoe and paddle to a friendly camp, there to woo the dusky maiden of his heart. And I thought that, after all, he knew how to live. Savage though he was, he knew the secret of happiness, and contentment was his lot. When he arose in the morning, just as the tender light of dawn was purpling the distant hills, he knew that he had not to face the stern realities of business. The rise and fall of stocks; the petty quibbling, confusion and consternation everywhere found in the busy marts of trade; social caste, and the worthless badge of distinction were alike unknown to him. The surge and swell of ambition, that sea upon whose rocky shores lie stranded the fortunes of the many great, did not agitate his bosom, while over the great domains of forest and stream hung no limitation of the law. Free and unrestrained, he was close to nature's heart—he was a partner of nature. He hunted, fished and tilled the soil, and the smoke curling upward from his pipe was like incense of gratitude to the Great Spirit. And as the lengthening shadows fell across the land, twilight faded into gloom, he retired to his wigwam to sleep the dreamless slumber that comes from perfect health.

The next day had been selected as moving day, but as the weather was very threatening, a general demurrer was entered against breaking camp. However, after breakfast, although the sky was still overcast, there was no rain forthcoming, and as we were anxious to get into Lovesick Lake, it was decided to run chances of getting wet and strike out. Accordingly the tent was quickly taken down and rolled, the duffle packed, and with a last, long, lingering, loving look at the beautiful cove, we dipped our paddles and were off for Lovesick. There was a strong wind sweeping down Stony, but by hugging in back of islands and working like hired men in the open reaches, we managed to make good headway, and in a couple of hours we swung into the charming bay on which are located the big summer hotels of Mt. Julian and Viamede. Here we stopped to write some letters and lay in a few stores, and then we were off again. By this time Phoebus had triumphed over the hosts of clouds, and his shafts of gold glimmered joyously on the dancing waters as we sped noiselessly along the devious paths that lead to Burleigh Falls, where we stopped for dinner.

The scenery around Burleigh is magnificent. Numbers of little islands thickly covered with trees and underbrush, picturesque ravines and yawning chasms, at whose bottoms percolate little streams that look like ribbons of water from the dizzy heights above, all contribute to the entrancing beauty. Great cliffs of clay and granite hang menacingly over the water, and instinctively you guide the canoe further out into the stream as you drift along. And rocks, rocks everywhere. Burleigh proper is a riot of rocks; little rocks and big rocks; shapely rocks and ugly rocks; the ground is covered with them; the walks are lined with them; acres and acres of rocks, where not even a blade of grass can get a foothold, and where no green thing is ever seen except the moss that freckles and patches the stony waste.

Here the guide sought out a man with a horse and wagon, who, for a nominal number of shekels and a phenomenal number of drinks, was persuaded to transport our canoes and duffle over the hill to Lovesick Lake; and once into this body of water, we struck out for Squirrel Island, about two miles from Burleigh. Fortunately, we found an ideal camping spot on the island, and from appearances a party had just vacated it. There was a rustic table, with seats, a fireplace and a good supply of firewood. We soon had the tent up, fresh balsam boughs cut, and in an hour the camp was replete with all the comforts of home. Then Elliott and Farber went out trolling for 'lunge, while Beck and I amused ourselves chasing scores of impudent little red squirrels away from camp, and finally, tiring of this sport, we went for a ramble around the island. Lovesick Lake is not a large body of water, being about two and a half miles long by a little over a mile in width. Just above our island, not over half a mile away, the waters of Deer Bay come rushing down into Lovesick in a series of rapids, whose roar boomed down to us on a clear night with the thunder of a young Niagara. There is an old Indian legend connected with these rapids to the effect that a white man, enamored of an Indian princess, was coming one day down from Deer Bay to see his bronzed Dulcinea, and the canoe, not speeding along fast enough to suit the primeval Lothario, he essayed to take the rapids at a jump. He was seen no more, and the princess, in the first wild throes of her grief, rushed to the brink of the stream that had claimed her lover, and with a wild cry of anguish and despair, cast herself far out into the seething billows, thus completing a double tragedy that has given the name of Lovesick to the relentless waters.

After mouching around the island for a while, we returned to camp for a pipe and novel, and to await the return of the guide and Farber. After supper we dragged all the available driftwood to the water's edge, and stacking up the logs in a kind of a lean-to structure, a roaring bonfire soon illuminated the surrounding islands and water for half a mile. There is always something fascinating about a fire, whether it be a ten-story block burning in sardonic defiance of the heroic efforts of firemen, or the little fires of leaves kindled by children in early autumn. Grown persons are drawn by some strange and irresistible force to contemplate the former with eager and expectant eyes, just as the youth in childish glee circles around the latter. And so were we, as the long tongues of flame shot upward from the pyramidal pyre, attracted by the

crackling logs as they emitted huge sparks, which floated off far beyond the borders of illumination. In the glare of the flames, nature took on a weird and grotesque appearance; the trees, bathed in the lurid light, seemed painted by the disappearing rays of the setting sun, their Titanic shadows merging in the gloom, while the waters of the lake shone with phosphorescent brilliancy.
